# 1. Introduction to the comparative Austronesian dictionary

---

**Darrell T. Tryon**

---

This volume is one of a series of comparative dictionaries planned to cover the major language families of the world. It deals with the Austronesian or Malayo-Polynesian language family, members of which account for at least twenty percent of the world's languages today. The family ranges from Madagascar off the east coast of Africa through Southeast Asia and right across the Pacific as far as Easter Island.(See Maps A - C). Details of the Austronesian family and related matters are provided in Chapters 2 and 3.

Like others in the series, this volume follows broadly the design of Carl Darling Buck's *Dictionary of Indo-European Synonyms* (University of Chicago Press, 1949). There are, however, some significant differences. While Buck's weighty tome consists almost entirely of a heavily annotated comparative lexicon of Indo-European roots, the present volume contains a number of other inclusions, discussed below, largely because of the fact that while the phonological and morpho-syntactic characteristics of the Indo-European languages are well known, for the languages of the Austronesian family this is much less the case.

The *Comparative Austronesian Dictionary* consists primarily of an annotated dictionary of synonyms for some 1200 lexical items in 80 different Austronesian languages. The lexicon very largely follows that used by Buck for Indo-European, with the deletion of some items inappropriate to the Austronesian world. Buck divided his corpus into twenty-two semantic domains, for example, the physical world, mankind, animals, body parts and bodily functions, food and drink, clothing etc. These same domains have been preserved here as has Buck's item numbering system, so as to ensure ease of comparison for any given lexeme across volumes. This arrangement will be maintained throughout the series. For each lexical item the equivalents are given for the 80 languages selected to represent the Austronesian family. In addition for each item there is considerable footnoting, indicated by an asterisk beside each language name or acronym. This footnoting is designed to provide information on synonyms, alternative forms and semantic mismatches, along with relevant comparative-historical and sociological information. For each item only one head word has generally been admitted, alternative or variant forms being discussed in

---

footnotes for individual items. Borrowings are indicated in the tables by the use of square brackets. Where borrowings are numerous for any given lexical item, the source or sources are listed in a separate box at the head of each list.

The lexicon is preceded by a number of chapters treating the Austronesian language family, apart from the present chapter which is designed to provide rather an introduction to this volume. Chapter 2 describes the membership and geographical distribution of the Austronesian family. It also provides a broad brush sketch of the subgrouping of the Austronesian languages by means of a number of family tree diagrams so as to indicate the relevance and position of the 80 languages represented in the volume. This is followed by a brief discussion of the spread and development of the Austronesian languages through time and space. Chapter 3 examines some specific problems confronting Austronesian linguistics today, especially in terms of subgrouping, and gives a detailed account of past and present solutions subgroup by subgroup, pointing out areas for which subgroupings are reasonably well established, while at the same time indicating the not insubstantial problem areas which remain, and which the material in this volume may go some way towards resolving, since nearly 50% of the languages represented in it are currently still unrepresented in the literature. Chapter 3 also deals with Proto-Austronesian phonology. Chapter 4 consists of an alphabetical listing of all known Austronesian languages, together with details of higher level classification, alternative names, dialects, location and current numbers of speakers.

It is in Chapter 5 that the present volume departs most radically from Buck's Indo-European volume, for the reason mentioned above, that little or nothing is known of many of the languages represented in this volume. This section consists of a series of 80 language sketches detailing briefly demographic and linguistic details for each language, each sketch accompanied by a locator map and including a phonological statement and the principal morphosyntactic characteristics of the language in question, devised with the aim of rendering the comparative lexical material as intelligible as possible, especially for languages where complex morphology and multiple verb forms are derivable. This is of particular relevance for the languages of Indonesia and the Philippines. Each individual language introduction is completed by a brief set of bibliographical references designed to provide further information and orientation for the reader.

This in turn is followed by a select Austronesian Bibliography, which also includes the language specific references provided throughout the introductory chapters. Ethnographic, geographic and other non-linguistic

---

---

references mentioned in the language-specific introductions are excluded from this bibliography. The Austronesian Bibliography is followed by a glossary of reconstructed forms, mostly at the level of Proto-Austronesian (PAN) and/or Proto-Malayo-Polynesian (PMP). These reconstructions are putative original forms from which the modern day forms evolved and developed. The methodology employed in making the reconstructions follows, of course, the classical comparative method evolved in the reconstruction of Proto-Indo-European. The comparative lexicon follows, completed by an index of English glosses.

The volume is illustrated by some eighty-three maps, three for the Austronesian family as a whole, and one for each of the eighty language sketches preceding the comparative lexicon.

While the editors tried to include as wide a range of Austronesian languages as possible, a comparative dictionary such as this cannot hope to include material from every Austronesian language. What is important from a comparative standpoint is that all of the more major subgroups of Austronesian are represented in the lexicon.

In response to the difficulties encountered in attempting to carry out comparative-historical linguistic studies based on materials collected at widely different periods, often dictionaries produced up to one hundred years apart, it was decided to attempt to present materials collected at roughly the same period. Accordingly, all the material contained in the *Comparative Austronesian Dictionary* was collected between 1986-1989. It was collected and compiled by recognised authorities on the languages listed above, based on extensive fieldwork and thus on a first-hand knowledge of the languages concerned. While representatives of every major Austronesian subgroup are included, and while the distribution of the languages is fairly even across the family, it was disappointing that a couple of poorly known areas were not directly represented, namely Kalimantan in Indonesia, and the Chamic languages of mainland Southeast Asia. Unfortunately no linguists of sufficient experience were available in the field for these two areas. These gaps are more than amply compensated for, however, by the wealth of materials from many previously unpublished languages included, especially from Indonesia, from areas which are now felt to be critical for Austronesian subgrouping.

The *Comparative Austronesian Dictionary* is aimed both at linguists and at people with no special or prior knowledge of the languages of this widespread family. It is designed to serve as a resource document which will hopefully stimulate interest and research in the Austronesian world and at the same time heighten cultural awareness of this region.

---

---

## 2. The Austronesian languages

---

**Darrell T. Tryon**

---

---

Of the 5000-6000 languages spoken in the world today, some 2000, or nearly 40% are spoken on the islands in the Pacific and Indian Oceans and in Australia. With some exceptions these Indo-Pacific languages belong to one of three distinct families: Austronesian, Papuan or Australian.

The Australian language family consists of between 200 and 300 languages (Wurm 1972, Dixon 1980), spoken on the Australian continent and formerly on the Australian island state of Tasmania to its south. (It has not been conclusively established, however, that the languages of the Australian mainland and those of Tasmania are genetically related.) The last speaker of a Tasmanian language is known to have died in 1877. For a cartographical representation of the Australian Family, see also Wurm and Hattori (1981).

The Papuan languages constitute the second largest linguistic division in the Pacific and South-east Asia area (Wurm 1982, Foley 1986). They occupy nearly all of the great island of New Guinea (West Irian/Papua New Guinea), except for some coastal areas. Papuan languages are also spoken in northern Halmahera, and in Eastern Indonesia on Alor and Pantar and parts of Timor. On the eastern side of the great island of New Guinea, Papuan languages are also spoken in parts of New Britain, New Ireland, Bougainville, and scattered parts of the Solomon Islands as far south-east as the Santa Cruz group. Wurm reports (1982: 13) that there are 741 known Papuan languages, 507 of which belong to a single language grouping, the Trans-New Guinea Phylum. He estimates that this higher level grouping includes about 80% of all Papuan speakers. It should be observed, however, that traditional classic comparative historical techniques have been applied to very few Papuan languages, so that while a broad-brush picture is emerging, it will be some time before any definitive subgrouping can be contemplated. Indeed, the term "Papuan" is a convenient term for the non-Austronesian languages of Papua New Guinea and Eastern Indonesia, not all of which are demonstrably related.

The Austronesian language family, formerly known as Malayo-Polynesian, (see Maps A-C) is arguably the largest language family in the world, and certainly extends over the largest geographical area of any

---

---

language family today outside of Indo-European. Current estimates (see Chapter 4 this volume) put the total number of Austronesian languages at somewhere around 1,200 or roughly 20% of all the languages of the world.

Austronesian languages extend from the island of Mayotte in the Comoro group off the coast of Madagascar in the west to Easter Island in the eastern Pacific, a distance of some 15,000 kilometres. Austronesian languages are spoken not only in Madagascar, but also in almost all of Malaysia, Singapore and Indonesia (with the exception of Irian Jaya, North Halmahera, Alor, Pantar and east Timor, where many Papuan languages are spoken). They are also spoken in parts of southern Vietnam and Cambodia, in Taiwan and throughout the Philippines. Further to the east, they are spoken in the coastal areas of Papua New Guinea (but not generally the interior, see Map B), in New Britain and New Ireland and right down the Melanesian chain through the Solomon Islands and Vanuatu as far as New Caledonia and Fiji. From there they extend eastwards to include all of the languages of Polynesia and northwards to take in all of the languages of Micronesia. Austronesian languages are also reported to be spoken in the Mergui archipelago off the coast of Burma, in the Andaman Islands and on Hainan Island in southern China.

The total number of Austronesian speakers today is estimated at around 270 million. The distribution of the Austronesian-speaking population is spectacularly uneven, with all but about 2 million speakers living west of a line north-south at about 130° east longitude, extending from just west of the Caroline Islands and just east of the Bird's Head on the island of New Guinea. However, the distribution of languages over the Austronesian-speaking region is relatively even. On either side of the north-south line just described, there are something like 500 languages spoken. (For a detailed listing see Chapter 4 below.)

---

### **Language distribution**

---

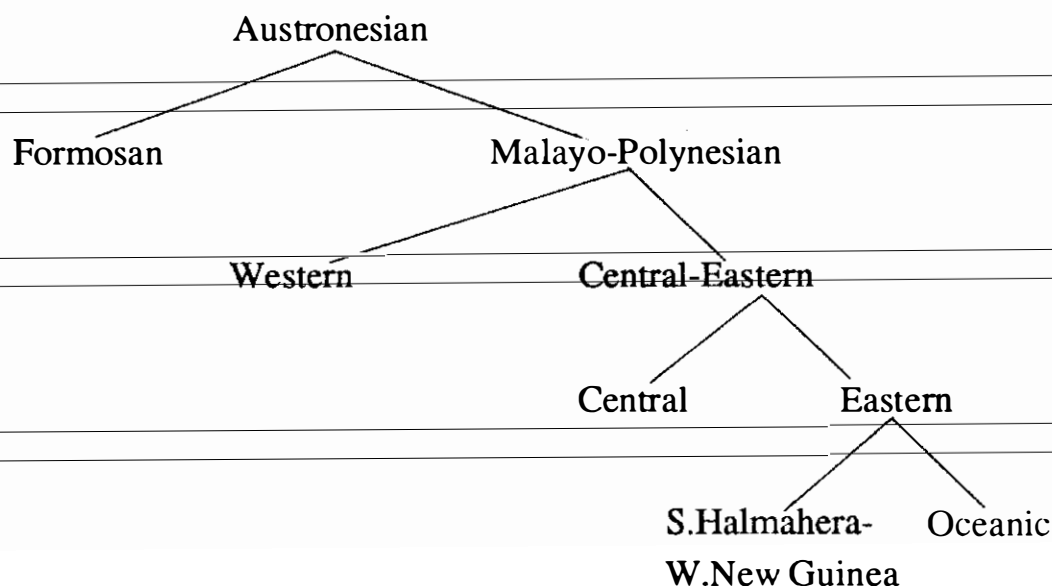

The higher order subgrouping of Austronesian remains controversial. The following grouping (after Blust 1977, 1978, 1982) is, however, followed by many scholars as a working hypothesis. (Subgrouping issues are discussed in more detail in a later section and by Ross, this volume. See also Figs. 1-8 for a more detailed representation):

---

---

---

---

It is widely reported that the island of Taiwan (Formosa), considered by many to be the Austronesian homeland, was formerly inhabited solely by Austronesian speakers. However, as a consequence of continued Chinese settlement from the mainland since the seventeenth century, today the Austronesian languages of Taiwan are largely confined to the mountainous interior of the island. Thus they constitute a minority population, subject to constant cultural and linguistic assimilation by the Chinese. Approximately 25 Austronesian languages have been recorded for Taiwan, some of which have become extinct (for example Hoanya and Kulun) and some of which have become Sinicised. Remaining speakers number no more than about 200,000. The Formosan languages, crucial to understanding the history of the Austronesian language family, are internally diverse. They are considered by a number of scholars to fall into three highest order subgroups, Atayalic, Tsouic and Paiwanic, these three enjoying co-ordinate status with a single other highest order subgroup, Malayo-Polynesian, which includes all of the Austronesian languages spoken outside Taiwan (see Figure 1 below). The major subdivisions of the Malayo-Polynesian subgroup of Austronesian are the Western and Central-Eastern subdivisions, as set out in Figure 2.

The Western subgroup of Austronesian (see Fig.3) is controversial. Diagnostic phonological and morpho-syntactic innovations are not clear-cut. At present, this subgroup consists of all of the languages of the Philippines as well as the Indonesian islands of Sumatra, Java, Madura, Bali, Lombok, and, to their north-west, Kalimantan (Borneo). Also included are the Malay Peninsula (with the exception of a few Mon-Khmer languages in the interior of Malaysia), and the Chamic languages of Vietnam and Cambodia, whose

nearest relative is Aceh, spoken in Sumatra. Added to these are the language(s) of Madagascar and two languages of Oceania, namely Chamorro (Mariana Islands) and Palau (Western Carolines), believed to have derived from the Philippines-Indonesia area.

While all of these languages are clearly Austronesian, they have undergone considerable cultural influence from mainland Asia and, more recently, from Europe. Indian culture reached Java and Sumatra in the first century AD, and from the 4th century diffused to Borneo and Sulawesi. Accordingly, many of the languages of the region contain extensive borrowings from Sanskrit. From the end of the 12th century Islam took root in island south-east Asia, spreading right across Indonesia and the Philippines, gradually supplanting Indian religions. In fact, Hinduism is practised today mainly on the island of Bali in eastern Indonesia. A third layer of borrowings was added with European colonisation of the region in the 16th century.

Malay, in its many manifestations, is the most important language of the region, for it has long been the principal lingua franca right across the Malaysia/Indonesia area. Today it is the national language in four countries of Southeast Asia, namely the Republic of Indonesia, the Federation of Malaysia, the Republic of Singapore and the Sultanate of Brunei. It was originally the mother tongue of some 6,000,000 people occupying both sides of the Strait of Malacca. Until the 13th century it was confined to east and south Sumatra and the facing coastline of the Malay Peninsula. It was a simplified form of the language, called Bazaar Malay, that came to be used as the regional lingua franca, for centuries prior to European contact. This situation came about partly because of the strategic position of Malacca on the trade routes and the fact that it was an important dispersal point for Islam, in addition to the role of the seafaring Malay traders throughout this island region. Malay was also adopted by later Dutch and British administrations. In the 20th century Malay, called Bahasa Malaysia in Malaysia, was adopted as the national language of the Republic of Indonesia, where it is known as Bahasa Indonesia. In Indonesia the language has undergone spelling reforms and a huge number of technical terms have been coined to accommodate modern technological advances. Indeed, there is collaboration across the whole Malay/Indonesian-speaking world in the area of language development.

Many languages of Sumatra are closely related to Malay, for example Minangkabau and Kerinci, and to a lesser extent Sundanese in west Java and Madurese, spoken in east Java and on Madura Island. Other important Sumatran languages include Aceh and Toba-Batak, with several million speakers each. Enggano, spoken on an island of the same name, off the south-east coast of Sumatra, has long been considered aberrant because of the

---

extremely low percentage of vocabulary shared with other languages in the area. However, Nothofer (1986) considers that Enggano and the other Barrier Island languages subgroup with the Batak languages.

Java is the most populous island in Indonesia, with more than 110,000,000 inhabitants. Yet there are only three indigenous languages spoken in the area. These are Javanese, the largest Austronesian language, with 75,000,000 speakers, Sundanese, with 27,000,000, and Madurese, with 9,000,000. Malay / Indonesian, which itself has several varieties, actually has more speakers than Javanese, although these are largely second language speakers for reasons discussed above. Javanese is spoken throughout central and east Java, and in some areas of west Java. It has an ancient written tradition, with early inscriptions dating from the 8th century AD, and a major literary tradition. However, there are records of a form of Malay heavily interlaced with Sanskrit going back even further, with stone inscriptions from southern Sumatra reaching back to the 7th century AD (Teeuw – Emanuels 1961). Old Javanese was a flourishing literary language. It was subject to extensive influence from Sanskrit during the period of the Indianised kingdoms of central and east Java. Modern Javanese is still used on radio and in newspapers and is generally written in Roman script (where previously an Indian-derived script was used). As with a number of other regional languages, Javanese has several registers or speech styles distinguishing degrees of respect and marked mainly by vocabulary differences, a product of the elaborate stratification of Javanese society.

Sundanese, with 27,000,000 speakers, is spoken throughout west Java, with minor exceptions, notably along the north coast of Banten and in the region of Indramaju, where Javanese is spoken. The Bandung dialect is taken as the standard today. Sundanese has been a written language since the 14th century. Madurese, with 9,000,000 speakers, has two principal varieties, western and eastern, the latter being adopted as the language of education. Balinese, with about 3,000,000 speakers, is spoken on the island of Bali and on the western part of Lombok.

Borneo (Kalimantan) is but sparsely populated, and most coastal areas are today occupied by speakers of languages closely related to Malay, for example Iban (Sea Dayak), Brunei Malay, Kutai Malay and Banjarese. Perhaps the most important Bornean language is Ngadju Dayak, spoken natively in the southwest of the island and used throughout southern Borneo as a lingua franca. The languages of northern Borneo are typologically similar to the languages of the Philippines. Examples include Kadazan and the Murut dialects of Sabah. Maanyan and its close relatives, spoken in south Borneo,

---

---

are the closest relatives of the languages/dialects of Madagascar (for a recent discussion, see Adelaar 1989, 1991).

The Malagasy dialects are spoken today by some 10,000,000 speakers, in a variety of dialects which show considerable internal diversity, sufficient perhaps to classify them as distinct languages. Merina, the official dialect of the Malagasy Republic has more than 5,000,000 speakers. Malagasy is also spoken on the island of Mayotte, to the northwest of Madagascar. The Malagasy dialects are reckoned to have originated in southern Borneo, in the South-east Barito area. They had contact with Sumatra, and then moved on to Madagascar sometime during the Srivijaya period, between the 7th and the 13th century A.D., and most probably at the beginning of this period. This was achieved through the agency of Malay/Bornean traders who travelled to Indian, Arabian and east African ports, from which Madagascar is believed to have been settled. It has even been suggested that the Barito-speaking Borneans may have been brought to Madagascar as slaves by the Malays (Adelaar 1989, 1991). The Austronesians are believed to have been the first inhabitants of Madagascar, although today there are a number of ethnic African racial groups represented in the population.

There are approximately 150 languages spoken in the Philippines today. Tagalog, the largest of the Filipino languages, has about 10,000,000 first language speakers, mainly in central and southwestern Luzon. A standardised variety of Tagalog, called Pilipino, has been the national language of the Philippines since 1946. It is estimated that it is understood by more than 25,000,000 Filipinos today. As the national language, it is widely used in education and government, and in the news media.

The languages of the Philippines fall into six major subgroups, as follows: a Batanic or Far Northern Subgroup, a Northern or Cordilleran subgroup, a Central or Meso-Philippine subgroup, a Southern Philippines subgroup, a South Mindanao subgroup. and a Sama subgroup. The Far Northern subgroup includes a number of languages with small numbers of speakers, such as Ibatan (Babuyan) in the Batan Islands north of Luzon, with only 1000 speakers, and Yami, spoken on Orchid Island (Lanyu), Taiwan by only 2600 speakers. The Northern group contains most of the languages of northern Luzon. The most important language in this area is Ilokano, which has some 5,300,000 speakers. In northern Luzon it is used as a lingua franca. Other languages in this group include Bontok, Ifugao, Gaddang, Isnag and Kalinga. Pangasinan, with 1,635,000 speakers in Pangasinan province, is another important member of the Northern subgroup. Pampangan (Kapampangan), with 1,853,000 speakers is also spoken on Luzon, to the northwest of the Tagalog-speaking area. The status of the Northern

---

Philippine subgroup is important in terms of Austronesian higher level subgrouping and as such will be further discussed below and in the chapter by Ross in this volume.

The Meso-Philippine subgroup, in addition to Tagalog, contains a number of important languages with very large numbers of speakers. These include: Cebuano (also known as Visayan and Sugbuhanon) with 12,000,000 speakers on Negros, Cebu, Bohol, Visayas and parts of Mindanao; Hiligaynon (also known as Ilonggo), with 4,500,000 speakers in the Iloilo and Capiz provinces, Panay, Negros Occidental and Visayas; Bikol, with 2,500,000 speakers in southeastern Luzon; Cebuano is used as a trade language throughout Mindanao as is Hiligaynon in Panay and adjacent islands and on Negros.

The Southern Philippines subgroup contains a number of important languages also, for example Maranao (600,000 speakers) on Mindanao, Subanon (50,000 speakers), Sarangani Manobo (35,000 speakers), and Kagayanen (30,000 speakers). Important members of the Southern Mindanao subgroup include Blaan (100,000 speakers) in the South Cotabato Province, and Tiruray (35,000 speakers). Although the Sama subgroup is geographically within the Philippines, it is more closely related to the languages of Indonesia. It includes such languages as Balangingi Sama and Central Sama, with 60,000 and 100,000 speakers respectively, in the Sulu Archipelago northeast of Jolo and on the Zamboanga coast of western Mindanao. The Sama dialects are also spoken outside the Philippines, in Sabah, Flores and Sulawesi. The total number of Sama speakers has not been determined fully, but it is certainly in the order of several hundred thousand. In the Sulu Archipelago there is also Tausug, also known as Sulu, with first language speakers totalling close to 500,000, of whom 330,000 live in the Philippines, but with significant populations also in Sabah and Kalimantan, used by the same number of speakers again as a second language. Tausug is a Bisayan language.

There are relatively very few Austronesian languages spoken on the Asian mainland, only Malay on the Malay Peninsula, and the Chamic group of Austronesian languages spoken by ethnic minorities in Vietnam and Cambodia, some 500,000 in all. There is also a group of Chamic speakers on the southern part of Hainan Island in the People's Republic of China. Completing the picture in this area is the Moklen language spoken in the Mergui archipelago off the west coast of southern Myanmar (formerly Burma).

Sulawesi (formerly known as Celebes) with over 100 languages, is the most diverse area outside the Oceanic region. The languages of the northern

---

---

part of the island show closer agreement with the languages of the Philippines than with the other languages of Sulawesi. These include Gorontalo (900,000 speakers), and Sangir (200,000 speakers). By far the largest language in the area is Buginese, with something over 3,500,000 speakers. Apart from southeastern Sulawesi, Buginese is also spoken by enclaves in Kalimantan (Borneo), Maluku, Irian Jaya and Sumatra. Other important Sulawesi languages include Makassarese (1,600,000 speakers), Muna (220,000 speakers) and Konjo (200,000 speakers).

The Central-Eastern subgroup of Austronesian (see Figs 4-5) consists of the languages of Eastern Indonesia, namely the Lesser Sunda Islands, the Moluccas and the coastal regions of Irian Jaya, as well as the Oceanic subgroup discussed below. The Indonesian part of the Central-Eastern Malayo-Polynesian subgroup contains some 150 Austronesian languages. Within this area, Papuan languages are spoken on Alor and Pantar, on parts of Timor, on northern Halmahera and the inland regions of Irian Jaya. The Austronesian languages of Eastern Indonesia are extremely diverse and even today their inter-relationships are not well established. Evidence has been adduced, however, which would separate the Austronesian languages of South Halmahera and Irian Jaya from the other languages of Eastern Indonesia. Important languages within the region include Bima (500,000 speakers), Manggarai (400,000 speakers), Solor (310,000 speakers), Sumba (200,000 speakers), Sika (180,000 speakers), Roti (130,000 speakers), and Ngada (70,000 speakers). There are also many languages with only relatively tiny numbers of speakers scattered around the myriad of small islands in the region, most of them not at all closely related, for example Asilulu (8700 speakers) on Ambon, Dobel in the Aru Islands (5,000 speakers), and Boano (3200 speakers) on Ceram. This remains perhaps the least known area in the Austronesian world today.

The huge Oceanic subgroup of Austronesian languages (see Map A and Fig.6) lies to the east of a north-south line drawn about 130° east longitude. It begins on the great island of New Guinea and extends eastwards right across Oceania. The Oceanic languages are rather different from their western counterparts. As noted above, they number approximately 500, depending on the language/dialect criteria adopted. Yet they have no more than two million speakers. Melanesia exhibits one of the highest linguistic densities in the world, in terms of number of languages relative to total population, with an average of a little over three thousand speakers per language.

The higher order classification of the Oceanic languages can still only be regarded as tentative, especially those of Melanesia (Papua New Guinea,

Solomon Islands, Vanuatu, New Caledonia). Some scholars distinguish three higher level subgroups, (1) a large Western Oceanic subgroup, consisting of all of the Austronesian languages of Papua New Guinea, including New Ireland, New Britain and Bougainville, plus the Austronesian languages of the Western Solomons as far south-east as Bughotu on the island of Santa Ysabel (Ross 1988), (2) an Admiralties group, consisting of the languages of the Admiralty Islands to the north of the island of New Guinea, (3) Central-Eastern Oceanic, consisting of the remaining Austronesian languages of Melanesia, together with those of Polynesia and Micronesia.

In Papua New Guinea there are an estimated 220 distinct Austronesian languages. As with Irian Jaya, the Austronesian languages of Papua New Guinea are basically limited to coastal areas, the interior of the island being occupied by Papuan speakers. They extend in patches along the north coast and also along the southeast coast of Papua as far west as Cape Possession, some 150 kilometres west of Port Moresby. Austronesian languages are also spoken in the northeast, in the Sepik, Morobe and Madang areas and on the offshore islands. In these areas the languages have been influenced to varying degrees by neighbouring Papuan languages. Austronesian languages, some of which are extremely diverse, are also spoken on the larger islands of New Britain and New Ireland as well as Bougainville. The Admiralty Islands to the north of the Papua New Guinea mainland also host a large number of Austronesian languages. In comparison with the Austronesian languages of the Philippines and Indonesia, individual Oceanic languages have relatively few speakers. The largest Austronesian language of Papua New Guinea is Tolai on east New Britain with approximately 60,000 speakers, well ahead of Motu, with 14,000, in the region of Port Moresby, the capital of Papua New Guinea. Both of these languages have acquired considerable status, as they were formerly the languages of important administrative areas, Tolai being spoken in and around Rabaul, the old German capital on New Britain and Motu up and down the Papuan coast. In fact a simplified variety of Motu known as Hiri Motu (or Police Motu) is widely used throughout Papua as a lingua franca. A number of other Austronesian languages have also been used as mission lingua francas, for example Yabem and Graged in the Madang Province.

In the Solomon Islands to the south-east of Papua New Guinea, there are 62 languages spoken, 57 of which are Austronesian (see Map C), this for a population of something around 300,000. The largest of these languages, Kwara'ae, spoken on the island of Malaita, has more than 20,000 speakers. Here again, a number of languages have been adopted as mission languages,

---

---

for example Roviana on New Georgia, with something like 6,000 first language and 16,000 second language speakers. Other such languages include Babatana (Choiseul), Ghari (Guadalcanal), Bughotu (Santa Ysabel) and Nggela (Florida and San Cristobal). A number of Polynesian languages (also known as Polynesian Outliers) are spoken in the Solomons, namely Luangiua (Ontong Java), Sikaiana, Rennell-Bellona, Pileni, Tikopian and Anutan. These languages, the result of back migrations from Polynesia, are spoken over a wide area of Island Melanesia, from Papua New Guinea to New Caledonia. At the same time, there are a number of Papuan languages spoken in the Solomons, dotted along the chain from Vella Lavella in the northwest to the Santa Cruz group in the southeast.

Further still to the south-east, there are 105 Austronesian languages spoken in Vanuatu (the former New Hebrides Condominium) by some 140,000 inhabitants. All of the languages of the northern and central parts of Vanuatu are members of a single large subgroup. The best known languages are Mota, the language of the island of the same name in the Banks Islands, and Efatese from the Efate-Shepherds area. Mota was the lingua franca of the Melanesian Mission (Anglican) in Vanuatu and the southeast Solomons from 1864 until 1931 (when it was officially replaced by English) while Efatese, especially in the Nguna-Tongoa dialect, was and is widely used by the Presbyterian Church. There are no Papuan languages spoken in Vanuatu, but there are three Polynesian languages: Emae, Mele-Fila and Futuna-Aniwa.

In New Caledonia, at the southern end of the Melanesian chain, there are approximately 25 languages spoken by an indigenous population of approximately 45,000. The languages of New Caledonia and the Loyalty Islands are considered to form a single subgroup, even though they are internally rather diverse. The languages are characterised by complex phonologies, and a number of them in the centre and south have developed tone. Again, the languages have small numbers of speakers, the best known being A'jië (Houailou), with 7,000 first language speakers. A'jië was also used as a mission lingua franca by the Eglise Protestante. There is one Polynesian language spoken in New Caledonia, namely West Uvean, on Ouvea in the Loyalty Islands.

In Island Melanesia, then, the ratio of languages to numbers of speakers is spectacularly high. The causes of this proliferation of small, discrete language communities are discussed in Pawley (1981) and Lynch (1981).

In Fiji, Polynesia and Micronesia, languages often extend over a number of neighbouring islands, making for relatively large speech communities. The Fijian dialects, considered by many to constitute two distinct languages,

have over 200,000 speakers. Bauan, an eastern dialect, became the lingua franca of all Fiji in the nineteenth century and remains so today. It is widely used in the press and on radio. 300 kilometres to the north of Fiji, Rotuman, spoken on the island of Rotuma, is a “Melanesian” language strongly influenced by Polynesian languages.

Polynesia covers a vast area in the central and eastern Pacific. The Polynesian Triangle, as it is commonly known, is bounded by Hawaii, Easter Island and New Zealand (see Map A). The 16 languages of Triangle Polynesia belong to a well-defined “Polynesian” subgroup, which also contains some 14 Polynesian languages spoken outside Triangle Polynesia proper in the Melanesian area and in the southern reaches of Micronesia. These “Polynesian Outliers” resulted from back migrations from central Polynesia. As will be seen from Figs. 7-8, the Polynesian languages have their nearest relatives in southeastern Melanesia, and almost certainly developed their distinctive characteristics during a period of isolation in the Fiji-Tonga area. Among the leading Polynesian languages, Samoan has well over 200,000 speakers, and Tongan 130,000. Both of these languages have large migrant communities of speakers in New Zealand and to a lesser extent in the USA. Tahitian has approximately 120,000 speakers in the Society Islands. It is generally used throughout French Polynesia as a working language, in the Marquesas Islands, the Tuamotus, the Gambiers (Mangareva) and the Austral Group, since it is a required language for all Polynesians within the administration. New Zealand Maori has approximately 100,000 speakers. It has assumed considerable political importance within that country in recent years, having belatedly been granted official status. Indeed, the major Polynesian languages are used daily in the press and on radio and television (in French Polynesia, New Zealand and American Samoa). Hawaiian has barely survived the ravages of its extensive contact with the non-Polynesian world. In the eighteenth and nineteenth centuries Hawaiian speakers numbered around 100,000, but today Hawaiian is used by only a few hundred speakers as a language of daily communication. The Polynesian languages fall into two major subgroups, Tongic (Tongan and Niuean) and Nuclear Polynesian (the remaining Polynesian languages). Within the Nuclear Polynesian subgroup, Marquesan, Hawaiian, Tahitian, Tuamotuan, Mangarevan, Rapanui, Cook Islands Maori, and New Zealand Maori fall into one well-marked Eastern Polynesian division, while the remainder, Samoan, East Futunan, East Uvean, Tokelauan, Tuvaluan, Niufo’ouan, Pukapukan and all of the Polynesian Outlier languages, are sometimes assigned to another less well-defined subgroup.

---

---

The languages of Micronesia are spoken on a multitude of tiny islands in an area which lies to the north of Melanesia, between the Philippines and Triangle Polynesia. The Micronesian languages number around 12 - 15, depending on the distinguishing criteria used. Some of these languages extend over large areas as dialect chains, as for example Trukic, with more than 40,000 speakers occupying most of the western Caroline Islands. Other major Micronesian languages include Chamorro, spoken on Guam and the Marianas by more than 70,000 speakers, Kiribati (formerly known as Gilbertese) with a similar number, and Marshallese with more than 29,000 speakers. The Micronesian languages proper, for example Trukese, Marshallese, Kiribati, Ponapean, Kusaiean, Carolinian and Ulithian are all members of a single subgroup, Nuclear Micronesian, whose origins lie almost certainly in Island Melanesia. Of the languages of Micronesia, two are Polynesian, namely Nukuoro and Kapingamarangi, spoken on atolls south of Truk and Ponape. Two others, namely Chamorro, already discussed above, and Palauan, spoken in the Belau Group, are non-Oceanic languages. Chamorro is a Philippine-type language, while Palauan also has its immediate affiliations in the Philippines-Indonesia area. Two of the Micronesian languages, namely Yapese, spoken on the island of Yap, and Nauruan, spoken on Nauru, are still of uncertain affiliation in that they have not been definitely assigned to the Nuclear Micronesian subgroup. The Micronesian languages have complex phonologies and equally complex numeral and classifier systems. Although there is a high degree of literacy throughout Micronesia, the orthographical systems devised for these phonologically complex languages are complicated and not as readily employed as in most Austronesian language areas, where literacy in local languages is widespread, especially in Polynesia and the Indonesia-Philippines area.

---

### **Ranking of major Austronesian languages 1990**

While the great majority of the Austronesian languages have few speakers by world standards, there are twenty five Austronesian languages with more than one million speakers today. They are as follows:

---

---

---

---

Language	Location	Speakers
Javanese	Indonesia	75,000,000
Malay/Indonesian	Malaysia, Brunei, Indonesia	52,000,000
Sundanese	Indonesia	27,000,000
Cebuano	Philippines	12,000,000
Tagalog	Philippines	10,500,000
Malagasy	Madagascar	10,000,000
Madura	Indonesia	9,000,000
Minangkabau	Indonesia	6,500,000
Ilokano	Philippines	5,300,000
Hiligaynon	Philippines	4,500,000
Bugis	Indonesia	3,600,000
Balinese	Indonesia	3,000,000
Bikol	Philippines	2,500,000
Aceh	Indonesia	2,400,000
Waray-Waray	Philippines	2,180,000
Banjar	Indonesia	2,100,000
Sasak	Indonesia	2,100,000
Toba Batak	Indonesia	2,000,000
Pampangan	Philippines	1,853,000
Pangasinan	Philippines	1,635,000
Makassar	Indonesia	1,600,000
Lampung	Indonesia	1,500,000
Dairi Batak	Indonesia	1,200,000
Pattani Malay	Thailand	1,000,000
Rejang	Indonesia	1,000,000

These twenty five languages alone account for more than 240,000,000 speakers, or something like 87% of all Austronesian language speakers. As the table indicates, Javanese has by far the greatest number of speakers, with 75,000,000. Although it has fewer native speakers, Malay (known as Bahasa Indonesia in Indonesia) has achieved the widest currency of any of the languages spoken in the region, since it has been the lingua franca of the whole Malay Archipelago for centuries, and is presently the national language of both Indonesia and Malaysia. As such it would have over 100,000,000 speakers today.

## History and classification

Dyen (1971: 5) records that the first notions of a language family that today is known as Austronesian probably goes back to the year 1706, when Hadrian Reland, a Dutch scholar, noted resemblances between the languages of Madagascar, the East Indies and Cocos Island. However, the definite establishment of the Austronesian family (originally known as Malayo-Polynesian) was due to Lorenzo Hervas y Panduro in his *Catalogo delle lingue* (1784). The name Malayo-Polynesian itself first appeared in Wilhelm von Humboldt's *Über die Kawi-Sprache auf der Insel Java* (1836-39). It was not until late in the nineteenth century, however, before the full extent of family membership was realised, and the languages of Micronesia and Melanesia added. Indeed the name Austronesian was given to the family by Wilhelm Schmidt in 1899 in his article "Die sprachlichen Verhältnisse Ozeaniens". Clark (1987) reports that evidence goes back even further, to the early seventeenth century, when the earliest Polynesian wordlists collected by Dutch explorers were compared with Malay, already well known at that time as the lingua franca of the East Indies. He refers presumably to the material collected in during the Schouten and Le Maire expedition, which visited the northern outliers of Tonga, Futuna and Alofi in 1616.

A comparison of some basic lexical items from widely separated areas gives a preliminary idea of the similarities encountered by earlier Austronesian scholars:

	MGY	IND	TAG	ROV	EFI	SAM
two	<i>rua</i>	<i>dua</i>	<i>dalawa</i>	<i>karua</i>	<i>rua</i>	<i>lua</i>
four	<i>efatʳa</i>	<i>empat</i>	<i>āpat</i>	<i>made</i>	<i>βā</i>	<i>fā</i>
five	<i>dimi</i>	<i>lima</i>	<i>lima</i>	<i>lima</i>	<i>lima</i>	<i>lima</i>
six	<i>enina</i>	<i>enam</i>	<i>ānim</i>	<i>onomo</i>	<i>ono</i>	<i>ono</i>
fish	<i>hazandʳanu</i>	<i>ikan</i>	<i>isdaʳ</i>	<i>iyana</i>	<i>ika</i>	<i>iʳa</i>
bird	<i>vuruna</i>	<i>buruṅ</i>	<i>ībon</i>	<i>kurukuru</i>	<i>manumanu</i>	<i>manulele</i>
stone	<i>vatu</i>	<i>batu</i>	<i>bato</i>	<i>patu</i>	<i>βatu</i>	<i>maʳa</i>
louse	<i>hau</i>	<i>kutu</i>	<i>kūto</i>	<i>ṽutu</i>	<i>kutu</i>	<i>ʳutu</i>
eye	<i>masu</i>	<i>mata</i>	<i>mata</i>	<i>mata</i>	<i>mata</i>	<i>mata</i>
die	<i>mati</i>	<i>mati</i>	<i>matay</i>	<i>mate</i>	<i>mate</i>	<i>mate</i>
road	<i>lalana</i>	<i>jalan</i>	<i>daʳan</i>	<i>siraṅa</i>	<i>sala</i>	<i>ʳau-ala</i>
coconut	<i>vuaniu</i>	<i>kālapa</i>	<i>niyog</i>	<i>ṅohara</i>	<i>niu</i>	<i>niu</i>

By the middle of the nineteenth century, a number of extensive grammars and dictionaries of Austronesian languages had appeared, covering such

languages as Javanese, Malay, Dayak, Bisayan, Batak, Makassar, Seram, Fijian, Samoan, Tahitian and New Zealand Maori. The availability of this material set the scene for the first attempts to reconstruct the language ancestral to these widespread but clearly related languages. H.N. van der Tuuk (1861, 1864, 1865, 1867) was the first to apply the principles of Indo-European comparative linguistics to the Austronesian languages. His work on Batak, Batavian Malay, Malagasy, Old Javanese and Balinese provided a starting point for the next generation of Austronesian historical linguists.

Van der Tuuk's material was collected together and analysed by Brandes (1884), and Kern, also using his own materials as well as that collected by his predecessors, wrote a number of major essays, the most influential of which concerned the Austronesian homeland. He argued that the linguistic evidence from lexical reconstruction pointed to an area of origin either in Indonesia or on the east coast of Farther India, but concluded that the Indo-China coast was a better hypothesis for a number of reasons (Kern 1889). In the Pacific region, Codrington (1885) published an extensive comparative study on the Melanesian languages, based on his missionary work in the Solomon Islands and Vanuatu. Using materials mainly from the languages of Indonesia, the Philippines and Taiwan, Brandstetter (1893) undertook a systematic reconstruction of the phonology, grammar and lexicon of the original ancestral language, Proto-Austronesian.

Perhaps the greatest single contribution to Austronesian comparative linguistics was made by a German scholar, Otto Dempwolff, who conducted extensive fieldwork in the Papua New Guinea area in the 1900s, the materials from which he added to the by then considerable body of material available in Austronesian languages. Until Dempwolff's era and indeed even in later decades, it was common to classify the Austronesian languages into four linguistic groups corresponding with the major geographical regions of Indonesia, Melanesia, Micronesia and Polynesia (see Map A). Dempwolff demonstrated the regular sound correspondences which existed between many of the languages known at that time, and reconstructed a lexicon of Proto-Austronesian, the putative ancestral language from which all Austronesian languages descend. His monumental three volume work, *Vergleichende Lautlehre des austronesischen Wortschatzes* (1934-38) contains a reconstructed lexicon of some 2215 items (including a good many doublets). His greatest contribution was the reconstruction of the historical phonology of Proto-Austronesian (to a level now equated with Proto-Malayo-Polynesian), Proto-Oceanic and Proto-Polynesian. In the area of subgrouping he demonstrated that the geographically-based grouping previously espoused was linguistically untenable and that the Austronesian

languages of Melanesia, Polynesia and Micronesia (with the exception of Palauan and Chamorro in Micronesia and a small group of languages on the western end of New Guinea) are members of a single subgroup, called by him Ur-Melanesisch, but known today as the Oceanic subgroup (see Map A).

Since World War II, and especially since the 1960s, research into Austronesian languages has greatly increased, and the interrelationships between the languages have become better understood. There is now some consensus as far as the broader groupings are concerned. Dyen re-examined Dempwolff's material and included important material from the languages of Taiwan in his suggested revisions of Dempwolff's reconstructions. One of the more important contributions made by Dyen involved his recognition of a series of laryngeal sounds and an expanded lateral series in Proto-Austronesian (Dyen 1953). In 1965 Dyen published his *Lexicostatistical classification of the Austronesian languages*. This highly controversial work was an attempt at subgrouping the languages of the Austronesian family using statistical techniques measuring lexical replacement. For a critical discussion of this classification see Grace (1966). In the early post-war years Dahl also made an important contribution to the study of the Austronesian languages by demonstrating the close relationship between Malagasy on Madagascar, and the Barito languages of southwest Borneo (Dahl 1951). In more recent times his *Proto-Austronesian* (1973, 1976) has proposed further modifications to Dempwolff's reconstructed sound system. There have also been some significant advances made in the Pacific region. Among these are the reconstruction of a first Proto-Oceanic lexicon by Grace (1969) and the reconstruction of the morphology and syntax of Proto-Oceanic and its major subgroups (Pawley 1970, 1972, 1973, Pawley – Reid 1980, Lichtenberk 1983, 1985, Geraghty 1983). Ross (this volume) surveys current work on Austronesian subgrouping.

Blust has recently proposed the highest order subgrouping of Austronesian represented in Figs.1 and 2. He subdivides the Austronesian languages into four first order subgroups, three from the island of Taiwan (Atayalic, Tsouic and Paiwanic) and a single extra-Formosan subgroup embracing all other Austronesian languages, this subgroup being labelled Malayo-Polynesian (Blust 1978). Blust's claim that the Malayo-Polynesian subgroup constitutes a single first order subgroup of Austronesian is based largely on evidence from the reconstruction of the Formosan versus extra-Formosan pronouns (see Ross, this volume).

Blust further subdivides Malayo-Polynesian into two lower order groups, Western Malayo-Polynesian (WMP) and Central-Eastern Malayo-Polynesian (CEMP). As discussed above, the Western Malayo-Polynesian subgroup

comprises all of the Austronesian languages of the Philippines, Indonesia to the west of Sumbawa (see Map A), Borneo, the Malay Peninsula, Madagascar, and the Chamic languages of Kampuchea and Vietnam, Hainan, and the Mergui islands off the coast of Burma. The Central-Eastern Malayo-Polynesian subgroup subdivides into Central Malayo-Polynesian (CMP) and Eastern Malayo-Polynesian (EMP). The Central Malayo-Polynesian subgroup (see also Map A), includes the Austronesian languages of Indonesia in the Lesser Sunda Islands and the Moluccas. Eastern Malayo-Polynesian contains two subgroups, namely a small South Halmahera-West New Guinea group (SHWNG), which extends as far eastwards as Cenderawasih Bay in Irian Jaya, and the huge Oceanic group (OC), with close to 500 languages, extending as far east across the Pacific as Easter Island.

Blust's interpretation of the highest order subgroups of Austronesian is set out in Figures 1 and 2. It should be pointed out, however, that although there is a certain consensus concerning the major subgroups, there are also difficulties even at this level (Ross, this volume). The major problem is that the left-branching subgroups are largely grouped by default, the right-branching subgroups sharing phonological or morpho-syntactic innovations not shared by those to the left. Thus the lower order subgroups, represented in Figures 3 - 8, are, with a couple of notable exceptions, still problematic at all but the lowest levels. For example, Figure 3, the Western Malayo-Polynesian subgroup, is put forward by Blust (1978) and supported by Dyen (1982: 31). The lower order subdivisions of the Western Malayo-Polynesian subgroup, however, are based in part on McFarland (1980, 1983) for the Philippines subgroups, and on Ruhlen (1987) for the extra-Philippines subgroups. Ruhlen's subgroupings represent a very free reinterpretation of Blust (1978). The higher order subgrouping of the Philippines languages is still the subject of ongoing debate (Ross, this volume), with important implications for the higher level subgrouping of Austronesian languages. At the same time, Ruhlen's Sulawesi, Borneo and Sundic subgroups of Western Malayo-Polynesian are convenient geographic groupings only, rather than lower order subgroups based on substantial linguistic evidence. As such they will be subject to major revisions as research progresses in those areas. Figure 4, Central Malayo-Polynesian, is based on Blust (1990) and Grimes (1990), while Figure 5, the South Halmahera-West New Guinea subgroup, largely reflects the picture adduced in Blust (1978). Figure 6, the major subdivisions of Oceanic, is based on recent work by Ross (1988) on the languages of western Melanesia, and may be regarded as well documented.

The Central-Eastern Oceanic subgroup is proposed by Lynch – Tryon (1985), based on shared innovations, while the Central Pacific subgroup, Figure 8, is largely the result of extensive work by Pawley (1970, 1972, 1979) and Geraghty (1983).

The aim of this chapter is not to argue the pros and cons of the different subgroupings proposed by various scholars (for which see Ross this volume), but rather to present an orientation into the Austronesian family and a framework in which to couch the comparative materials which constitute the core of the volume.

AUSTRONESIAN FAMILY SUBGROUPINGS:

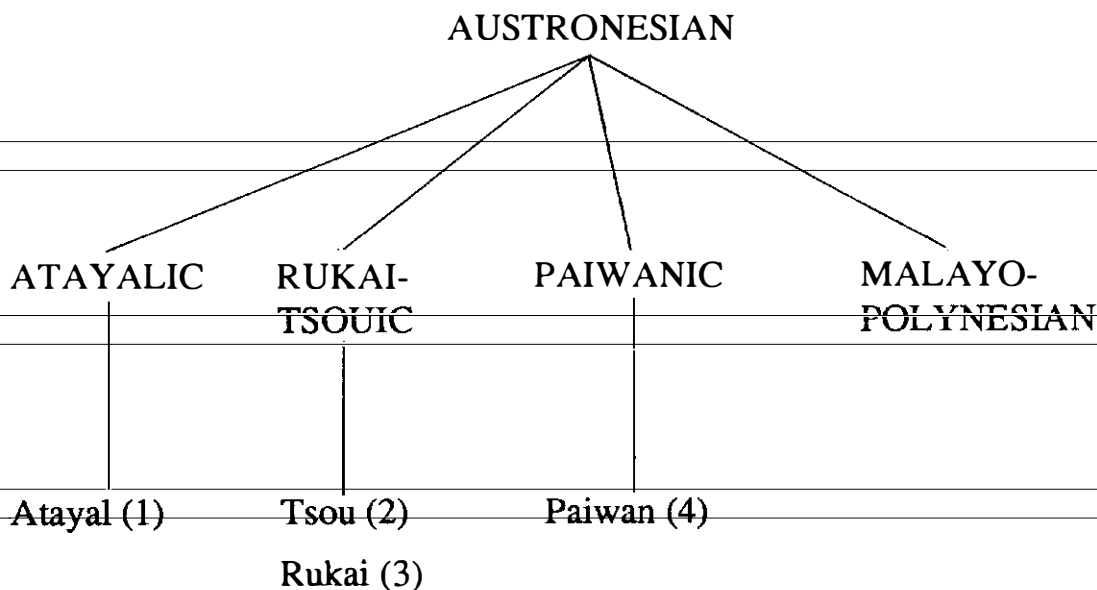

Figure 1. (After Blust 1978)

## Settlement/migrations

The first Austronesians are thought to have originated in the South China area. Some of their number moved off from the Asian mainland about 5,000-6,000 years ago and settled on the island of Taiwan, where they remained relatively undisturbed until Chinese migrations in the seventeenth century. As discussed above, the aboriginal languages of Taiwan are currently considered by many scholars to constitute three of the four first order subgroups of Austronesian. The linguistic evidence has made them prime candidates for Austronesian homeland status, based on the principle that the centre of the greatest linguistic diversity is likely to be the major dispersal point (Dyen 1956, 1965). It should be added that an earlier Austronesian presence on the China mainland has been based on prehistoric evidence from material culture.

The Austronesian languages outside Taiwan are considered to be members of a single first order subgroup called Malayo-Polynesian. Members of this subgroup moved south from Taiwan to the Philippines and eventually spread right through that archipelago. From the Philippines one group apparently moved south-west, through Borneo and subsequently Sumatra and Java, with branches penetrating the Malay Peninsula and eastern parts of Indochina, Vietnam and Kampuchea. This migration corresponds partly to the putative Western Malayo-Polynesian subgroup (Figs.2 and 3) (see Ross, this volume). A second migration from the Philippines carried the Austronesians south, first probably to northern Sulawesi. From there they are believed to have followed two paths. One would have moved south through Sulawesi and into the Ceram-Ambon area and Timor, corresponding to the Central Malayo-Polynesian subgroup (Fig.4). The other was directed towards southern Halmahera and Irian Jaya, and along the north coast of the great island of New Guinea, corresponding to the South Halmahera-West New Guinea subgroup (Fig.5). It was formerly believed that the Austronesians reached the Irian Jaya area about 3500 B.C. (Bellwood 1980), but today this date is believed to be nearer to 2500 B.C. (Bellwood, personal communication).

Apart from the migrations discussed above, there were evidently numerous and more or less continuous smaller scale migrations criss-crossing the Austronesian-speaking area to the west of the island of New Guinea, especially in the Philippines and western Indonesia. In this context it is noteworthy that the large island of Madagascar off the east coast of Africa was settled by an Austronesian migration from south-eastern Borneo (Kalimantan), via Sumatra, probably about 1300 years ago (Dahl 1951, Adelaar 1989, 1991).

Speakers of what were to become the Oceanic languages probably moved from the Halmahera/Irian Jaya area, passing along the northern coast of Papua New Guinea before settling in the New Britain/New Ireland area somewhere around 2000 B.C. They appear to have remained in this area for some time, relatively undisturbed by resident Papuan populations, judging by the number of phonological and morpho-syntactic innovations shared by the Oceanic subgroup of Austronesian.

Migrations subsequently radiated out from the New Britain/New Ireland area. Austronesian speakers moved relatively quickly south-east, making their way right through the Melanesian chain, the Solomon Islands, Vanuatu and New Caledonia, reaching Fiji about 1200 B.C.

A number of additional migrations are attested a little later, a most noteworthy one being the gradual spread of a Western Oceanic subgroup of Austronesian across much of Papua New Guinea and as far south-east as the island of Santa Isabel in the Solomon Islands after the initial settlement of the Papua New Guinea region (Ross 1988). This spread also included later moves westwards to the north and northeast coast of the mainland of Papua New Guinea and moves south to various parts of the coast of the main island, right around to the Papuan Gulf on the south coast. Another set of migrations perhaps originated in northern/central Vanuatu. One moved north, spreading the Austronesian languages throughout Micronesia (for which there is evidence of an east to west spread) (Shutler and Marck 1975, Jackson 1986). Another moved south-east to the Fiji group. From that area, after a period of consolidation (Geraghty 1983) the Polynesian languages evolved (see fig.8), moving probably east from the Tonga-Niue area sometime around 1000 B.C.

The migration history of the Polynesians has been fairly unequivocally established over the past thirty years. From the Tonga area, they spread first to the Samoas and the Tokelau group. From Samoa the Polynesian languages moved further eastwards, to the Marquesas, the Society Islands, the Tuamotus, Mangareva and Easter Island. Hawaii was settled from the Marquesas, while from the Society Islands the Polynesian languages/dialects found their way to the Cook Islands and finally to far-off New Zealand. Rapanui, the language of Easter Island, is still regarded by many as problematic, for while it is widely recognised as being the first to break away from the subgroup east of Samoa (the Eastern Polynesian languages), details of its development are still uncertain.

One further remark is needed concerning the Polynesian Outliers. These are Polynesian languages which originated from movements from Polynesia which have drifted westwards into parts of Melanesia and Micronesia during

the past 2000 years. They are all Nuclear Polynesian languages (see Fig.8). This subgroup is represented in the present volume by Mele-Fila from Vanuatu.

## Characteristics of Austronesian

### I. Phonology

Ross (this volume) has presented his interpretation of the phonology of Proto-Austronesian, the putative parent language from which all modern-day Austronesian languages are descended. He posits a voiced and voiceless stop/affricates series as follows:

p	t	C [ç]		k	q [k̟]	ʔ
b	d <sub>1</sub> [d]	d <sub>2</sub> [dʒ]	d <sub>3</sub> [d̥]	Z	g	

He posits voiceless and voiced series with bilabial, dental/alveolar, alveolar affricate and velar articulations, and also a voiceless uvular, a voiceless glottal, a voiced palatal and a voiced retroflex stop. He counts three nasals:

m	n	ŋ
---	---	---

four fricatives:

s	S [ʃ, ʂ]	h
ʃ [z]		

two laterals:

L [l, ɭ]	l [l, ɭ]
----------	----------

two trills:

r	R (a uvular trill)
---	--------------------

Proto-Austronesian also had four vowel phonemes and four word-final diphthongs, as follows:

i	u	-iw	-uy
e [ə]			
a		-ay	-aw

The phonemic systems of Austronesian languages vary greatly, some quite complex, for example those of the languages of New Caledonia, some of which have developed three stop series, oral and nasal vowels and a three tone system, plus phonemic vowel length, see Rivierre (Cèmuhi, No.65), this volume. Others, such as the Polynesian languages, have extremely reduced phoneme inventories, such as Hawaiian, with a total of only 13.

These are:

<i>p</i>		<i>k</i>	<i>ʔ</i>
<i>m</i>	<i>n</i>		
<i>w</i>	<i>l</i>		<i>h</i>
<i>i</i>			<i>u</i>
<i>e</i>			<i>o</i>
		<i>a</i>	

Most Austronesian word bases consisted of two syllables. The most common shape was CVCVC or CVCCVC. Only a very restricted range of consonant clusters was allowed, the most widespread being nasal + stop, usually occurring word medially. While this system is still well preserved in many of the languages to the west of the Oceanic subgroup, in the Oceanic languages there have been some dramatic changes, with phonetic nasal plus stop sequences being treated as single prenasalised consonants. In very many of the Oceanic languages the original word final consonants of Proto-Austronesian are systematically lost.

The western or non-Oceanic languages have fairly similar phonologies. A typical Philippines phonological table would include the following:

Consonants:

	Bilabial	Alveolar	Velar	Glottal
Stops	<i>p</i> <i>b</i>	<i>t</i> <i>d</i>	<i>k</i> <i>g</i>	<i>ʔ</i>
Fricatives		<i>s</i>		<i>h</i>
Nasals	<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals		<i>l</i>	<i>r</i>	
Semi vowels	<i>w</i>	<i>j</i>		

## Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid		<i>e</i>	
Low		<i>a</i>	

Most of the Indonesian languages, especially those in the west, have a phonological configuration as follows:

	Bilabial	Dental/Alveolar	Palatal	Velar	Glottal
Stops	<i>p</i> <i>b</i>	<i>t</i> <i>d</i>	<i>c</i> <i>j</i>	<i>k</i> <i>g</i>	
Fricatives		<i>s</i>			<i>h</i>
Nasals	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals		<i>l</i>	<i>r</i>		
Semivowels	<i>w</i>		<i>y</i>		

Among the languages of Indonesia, only Madurese and Javanese distinguish between alveolar and retroflex stops. It is considered that this distinction is due to the influence of Sanskrit on Javanese. Retroflex stops and laterals are also found in the Austronesian languages of Taiwan, and have been reconstructed (Ross, this volume) for Proto-Austronesian.

In terms of vowels, the Indonesian languages have developed more elaborate systems than that of the original Proto-Austronesian. Some have six-vowel systems, for example Malay, Buginese and Balinese, while Javanese is considered in some analyses to have eight. Malagasy and some of the other Indonesian-type languages have retained the original four vowel system.

The Oceanic subgroup of Austronesian, developed a five vowel system from Proto-Austronesian, whereby /i, u, a/ were retained, and the diphthongs /ay/ and /aw/ became /e/ and /o/ respectively.

The Proto-Oceanic consonant and vowel system has been reconstructed as follows:

	Velarised bilabial	Bilabial	Alveolar	Palatal	Velar	Post-velar
Stops	<i>bw</i>	<i>p b</i>	<i>t d</i>	<i>c j</i>	<i>k g</i>	<i>q</i>
Trills			<i>r dr</i>			
Sibilants			<i>s</i>			
Nasals	<i>mw</i>	<i>m</i>	<i>n</i>	<i>ñ</i>	<i>ŋ</i>	
Liquids			<i>l</i>			<i>R</i>
Glides	<i>w</i>			<i>y</i>		

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

## 2. Morpho-syntax

Austronesian languages are not nearly as complex, morphologically, as the neighbouring Papuan and Australian languages. Typically, verbs are prefixed, infixes or suffixed to indicate focus, voice and transitivity, and also to produce nominalised forms. Reduplication is used quite commonly with verbs to indicate aspect and with nouns to indicate number. Many roots may be used either as a verb or a noun indifferently. Adjectives and numerals very commonly act like verbs, as do some negative markers. Almost universally in the Austronesian languages, there are inclusive and exclusive forms for first person plural pronouns, the inclusive forms including both speaker and hearer while the exclusive form excludes the hearer. Nouns bear suffixes to indicate pronominal possession almost throughout the Austronesian family, although in the Oceanic subgroup this form of possession indication is restricted to body parts and kin terms. Normally pronouns marking subject or possessor are formally different from those marking object or focus.

In terms of the grammar of the major subgroups of Austronesian, the non-Oceanic languages (see Figs. 1 and 2) may be broadly represented by the Philippines languages. These languages are well known for their rather complex voice systems. Apart from distinguishing between active and

passive constructions, the languages of this area distinguish at least three other kinds of passive. The noun phrase which occurs as the “topic” of the sentence may represent the actor, the object or goal, the referent (benefactive or locative) or the instrument. These distinctions are marked in a number of ways. The voice of the verb is indicated by affixation. The subjective voice (active) is normally indicated by an infix *-um-* or the prefixes *ma-*, *mag-* and *maka-*. Objective voice is indicated by a suffix *-in* or *-an*.; referential voice is indicated by the suffix *-an*, and instrumental by the prefix *i-*. There are other ways of distinguishing passives, such as the marking of case with nominal particles and transposing phrases and changing stress. The following examples from Palawan exemplify the Philippine focus system (Revel-Macdonald 1979):

a. Agent focus

<i>mog</i>	<i>lamu?</i>	<i>libun</i>	<i>in</i>	<i>ot</i>	<i>lugow</i>	<i>kot</i>	<i>mosakit</i>	<i>sot</i>	<i>apuy</i>
make	cook	woman	that	the	rice soup	for	sick	on	fire
VP		NP		NP		NP		NP	

‘*The woman* will cook the rice soup on the fire for the sick person.’

b. Object focus

<i>lalamu?</i>	<i>on</i>	<i>ot</i>	<i>libun</i>	<i>lugow</i>	<i>in</i>	<i>kot</i>	<i>mosakit</i>	<i>sot</i>	<i>apuy</i>
be cooked	by	woman	soup	that	for	sick	on	fire	
VP		NP	NP		NP		NP		

‘*The rice soup* will be cooked by the woman on the fire for the sick person.’

c. Attribute focus

<i>lalamu?</i>	<i>an</i>	<i>ot</i>	<i>libun</i>	<i>ot</i>	<i>lugow</i>	<i>sot</i>	<i>apuy</i>	<i>mosakit</i>	<i>in</i>
be cooked	by	woman	that	soup	on	fire	sick	that	
VP		NP	NP	NP	NP	NP		NP	

‘It is *for the sick person* that the rice soup will be cooked on the fire by the woman.’

d. Locative focus

The other major subgroups of Western or non-Oceanic languages, the languages of Taiwan especially, and Indonesia also, although on a reduced scale, share a great deal of the morpho-syntactic characteristics of the Philippines languages. They are, however, less homogeneous than their Philippine counterparts. As indicated above, with all subgroups of Austronesian most word bases may function as nouns or verbs. There are numerous formative and transformative affixes in the languages of the Western Malayo-Polynesian subgroup which derive adjectives, nouns, adverbs, comparative and ordinal forms, in addition to various verbal constructions.

The languages of the Central Malayo-Polynesian subgroup, in eastern Indonesia, are less complex morphologically than their Western counterparts. In fact their morphology is quite similar to that found in the languages of the Oceanic subgroup. It should be observed, however, that they retain a number of distinctions which have been lost in the Oceanic languages.

In the languages of the Oceanic subgroup of Austronesian it is evident that morphological simplification has occurred compared to the historically older groups to their west. A number of verb and noun affixes were lost in the languages of the Oceanic subgroup. Indeed, some prefixes from the western languages were simply assimilated into the word base as non-productive elements, and some affixes in the western languages became reinterpreted as free-form particles in the languages of the Oceanic subgroup. New prefixes developed and the function and/or shape of certain earlier inherited ones changed.

With verbs, the languages outside the Oceanic subgroup use affixes to indicate tense, aspect and mode, as in the Palawan examples cited above. The languages of the Oceanic subgroup tend to use free form particles for this purpose. Many original verb bases function as post-verbal particles in the Oceanic languages, indicating direction such as upward or downward movement, or as tense-aspect markers, indicating for example a progressive aspect.

With nouns here are four common classes, indicated by the use of articles. The categories commonly distinguished are common nouns, personal

pronouns and personal names, locative nouns and temporal nouns. Personal pronouns fall into two sets, subject and possessive forms versus cardinal and object forms. The Oceanic languages have also developed a possessive system more elaborate than that which characterises the western Austronesian languages. Whereas noun possession in those languages is generally indicated by a suffix to the possessed noun, in the Oceanic languages this system has been retained only for a sub-set of nouns, namely body parts and kin terms. In the Oceanic languages two and sometimes three additional possession classes have developed, one for edibles, a neutral category, and in a large number of the languages of island Melanesia, a drinkable category.

In terms of syntax, the Austronesian languages are basically verb-initial or verb-second and prepositional. In contrast, the neighbouring Papuan languages are typically verb-final and postpositional. A number of Austronesian languages in the New Guinea area have come to follow this pattern under Papuan influence. Among noun modifiers, articles precede the noun, while all other modifiers (adjectives, numerals, relative clauses) generally follow.

### **Languages represented in this volume**

The eighty languages represented in the comparative lexicon, which constitutes the main body of this volume, represent all of the major and most of the minor recognised subgroups of the Austronesian language family. These language names, followed by numbers in parentheses, appear on the classificatory tree diagrams presented above. These numbers correspond to the introductions to individual languages given in Chapter 5. Within the comparative lexicon, the languages are identified by three-letter acronyms, listed below. (A separate Language Index Card is included with the volume.) These are listed below, together with major subgrouping details of the languages included, as follows:

	<b>Language</b>	<b>Acronym</b>	<b>Major subgroup</b>	<b>Location</b>
1.	Atayal	ATA	Atayalic	Taiwan
2.	Tsou	TSO	Tsouic	Taiwan
3.	Rukai	RUK	Tsouic	Taiwan
4.	Paiwan	PAI	Paiwanic	Taiwan

5.	Yami	YAM	WMP	Taiwan
6.	Isnag	ISN	WMP	Philippines
7.	Kalinga	KAL	WMP	Philippines
8.	Tagalog	TAG	WMP	Philippines
9.	Aklanon	AKL	WMP	Philippines
10.	Palawan	PAL	WMP	Philippines
11.	Molbog	MOL	WMP	Philippines
12.	Kagayanen	KAG	WMP	Philippines
13.	Blaan	BLA	WMP	Philippines
14.	Sama	SAB	WMP	Philippines
15.	Murut	MUR	WMP	Sabah
16.	Malagasy	MGY	WMP	Madagascar
17.	Aceh	ACE	WMP	Indonesia
18.	Batak	BAT	WMP	Indonesia
19.	Minangkabau	MIN	WMP	Indonesia
20.	Indonesian	IND	WMP	Indonesia
21.	Sundanese	SUN	WMP	Indonesia
22.	Javanese	JAV	WMP	Indonesia
23.	Madurese	MAD	WMP	Indonesia
24.	Balinese	BAL	WMP	Indonesia
25.	Sasak	SAS	WMP	Indonesia
26.	Gorontalo	GOR	WMP	Indonesia
27.	Da'a	DAA	WMP	Indonesia
28.	Uma	UMA	WMP	Indonesia
29.	Bugis	BUG	WMP	Indonesia
30.	Konjo	KON	WMP	Indonesia
31.	Wolio	WOL	WMP	Indonesia
32.	Manggarai	MAG	CMP	Indonesia
33.	Ngada	NGA	CMP	Indonesia
34.	Sikka	SIK	CMP	Indonesia
35.	Roti	RTI	CMP	Indonesia
36.	Buru	BUR	CMP	Indonesia
37.	Dobel	DOB	CMP	Indonesia
38.	Irarutu	IRA	SHWNG	Indonesia

### 3. Some current issues in Austronesian linguistics

---

**Malcolm D. Ross**

---

#### **Introduction**

---

A brief history of Austronesian studies and a thumbnail sketch of some current opinions concerning the genetic classification of Austronesian languages is provided by Tryon (this volume). A major purpose of this chapter is to provide for readers outside the narrow confines of Austronesian linguistic prehistory some indication of the strengths and weaknesses in our current knowledge, to point to possible directions of development in this understanding, and to indicate where fresh research is especially necessary. The issues to be reviewed here concern the reconstruction of Proto-Austronesian phonology and morphosyntax and the internal and external genetic relationships of Austronesian languages.<sup>1</sup>

---

#### **Subgrouping methodology**

---

The tree diagrams in Figures 1 to 8 of the previous chapter provide a sketch of our present understanding of the subgrouping of Austronesian languages. However, these diagrams entail a certain ambiguity, as they fail to distinguish between two different ways in which Austronesian languages and subgroups have diverged from each other: some have diverged by *dialect differentiation*, others by *separation*.<sup>2</sup>

---

Divergence by *dialect differentiation* has occurred when the dialects of a language spoken in different areas of the speech community have gradually become more and more different from each other, until the differences are so great that we must speak of different languages rather than of dialects. The process of differentiation has often been accelerated by the fact that among Austronesian speakers in the past the most important unit of political organisation was typically the village, and people have tended to identify with their village rather than with other speakers of their language. Peculiarities of a village's speech have tended to become an emblem of village identity both for the speakers and their neighbours, and as a result

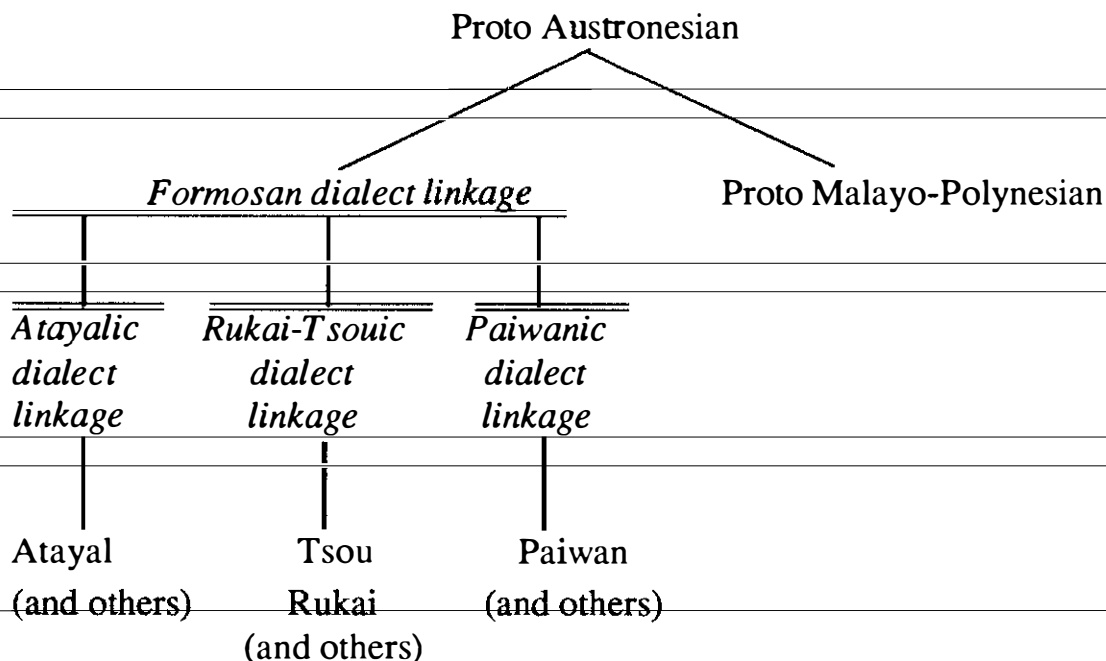

---

---

Whether languages diverge by dialect differentiation or by separation, it is clear that languages which belong to the same subgroup must be descended from a common ancestor at some time-depth or other. Thus in Figure 1, which shows the primary branches of the Austronesian language family, we could be pedantic and label the top node “Proto-Austronesian” instead of “Austronesian”, since in linguistic terminology a putative earlier language is labelled with the prefix “Proto-”, whereas an unprefixed term like “Austronesian” is taken to refer to a group of languages. At this point, however, a difficulty arises. Consistency would seem to require that we also label the branches “Proto-Atayalic”, “Proto-Tsouic”, “Proto-Paiwanic” and “Proto-Malayo-Polynesian”, rather than simply “Atayalic”, “Tsouic” and so on. But we can be reasonably confident that Proto-Austronesian (henceforth PAN) was spoken on Taiwan (see previous chapter; also Blust 1985, Bellwood 1985), and that the languages of the Atayalic, Tsouic and Paiwanic groups have had a continuous history of at least five thousand years on that island. It is therefore plausible that the languages of the Atayalic, Tsouic and Paiwanic groups have arisen by gradual dialect differentiation from the PAN (or its early descendant dialects) of those who stayed behind. This could mean that there never was a “Proto-Atayalic”, a “Proto-Tsouic” or a “Proto-Paiwanic”.

If we were to attempt to redraw Figure 1 less ambiguously using the conventions above, we might arrive at something like Figure 9. This says that Proto-Malayo-Polynesian (henceforth PMP) diverged from the Austronesian languages of Taiwan as the result of separation (when its speakers left Taiwan more than 4,500 years ago). This is a reasonable assumption. Figure 9 also says that the languages of the Atayalic, Tsouic and Paiwanic groups are descended, not from separate proto-languages, but from three dialect linkages which resulted from the break-up of the Formosan dialect linkage<sup>3</sup> into which PAN had differentiated around the time of the departure of PMP speakers. Whilst this is a plausible sequence of events, it is by no means the only possible one. There is some evidence, for example, that Atayalic forms one subgroup of languages and all the other Austronesian languages on Taiwan another, and that this latter subgroup is then divisible into the Tsouic and Paiwanic (and perhaps other) groups. However, even if this is so, we do not know (a) whether the primary split into Atayalic and non-Atayalic took place before or after or at about the same time as the departure of the speakers of PMP, and (b) whether these divisions took place by dialect differentiation or by separation, i.e. whether there ever was a “Proto-Atayalic”, a “Proto-Tsouic” or a “Proto-Paiwanic”. (Available evidence makes Proto-Paiwanic less likely than the other two.)

*Figure 9.* A hypothetical (but not necessarily correct) representation of the earliest branchings of the Austronesian language family

The point of this discussion is not to debate the early diversification of Austronesian languages, but rather to show that figures 1-8 are ambiguous — and that this ambiguity is a virtue, since to be more precise would imply that we know considerably more than we actually do.

We turn now to the question of how we can know what subgroups languages belong to and whether they have diverged by dialect differentiation or by separation.

Two methods are commonly used to determine the genetic relationships of languages and thereby to combine them into subgroups. These are the “classical” *comparative method* and the method of *lexicostatistics*.

Under the comparative method, a set of related languages is systematically compared and the proto-language from which they are supposedly descended is reconstructed. The languages in the set are then examined to determine what innovations in phonology and morphosyntax each reflects relative to the proto-language. These innovations typically pattern across languages in one of two ways, indicating whether the languages have diversified by separation or by dialect differentiation. When separation has occurred, groups of languages share discrete bundles of innovations. For example, within a set of languages A to Z whose reconstructed proto-language is Proto-AZ, languages A to M share a given

bundle of innovations (which are not shared by languages N to Z). From this we infer that A to M are descended from Proto-AM (itself a descendant of Proto-AZ) and that they share this bundle of innovations because the innovations occurred in Proto-AM itself.

In the second patterning of innovations, which characterises divergence by dialect differentiation, shared innovations form overlapping, rather than discrete, bunches. For example, among a set of languages A-G scattered in a line along a coastline, A, B and C may reflect one bunch of innovations, C, D, and E another bunch, and D, E, F, and G yet another bunch: that is, the bunches overlap in chain-like fashion. In an inland area or an archipelago, overlapping bunches of innovations may form a more complex network-like pattern. We might find innovations shared, for example, by A, B, and C, by C, D, E, and F, and by A, D, F, and G. Such overlaps arise because at some stage in the past proto-language AG has differentiated out into a dialect linkage (i.e. a chain or a network) whose member-dialects have remained in sufficient contact with each other for an innovation generated in one dialect of the linkage to diffuse through adjacent dialects of the linkage, i.e. undetected early borrowing has occurred.

There is one set of elements in language change which the classical comparative method does not readily recognise. Contact-induced change (change brought about in a dialect or language through its speakers' contact with a neighbouring dialect or language) does not only occur when neighbouring languages are closely related; it may also occur when they are genetically only distantly related or completely unrelated. For example, there are Austronesian languages in Melanesia whose grammars have undergone wholesale modification in the direction of neighbouring Papuan (non-AN) languages. Their speakers have become so much at home in the language of their neighbours that they have reshaped their language along Papuan lines. Interestingly, the basic vocabulary of such languages often includes few borrowings, because it is in the words themselves (and not in the structures in which the words are used) that speakers perceive the essence of the language and therefore the emblems of their own identity. Although the importance of this kind of change has been recognised for eighty years (see Ray 1911, 1926), it has received only sporadic attention from linguists working in Austronesian languages (Capell 1943, 1976, Lynch 1981, Pallesen 1985, Ross 1987) and is a major research need.

There is, however, a second, rather different kind of contact-induced change where vocabulary is borrowed, sometimes on quite a large scale, from a culturally dominant language, and the word lists note many such borrowings: from Sanskrit in western Indonesia (as a result of Indian cultural

---

influence), from Arabic in the Islamicised sections of the region, from Malay throughout Indonesia and the Philippines (through its long-time use as a *lingua franca*),<sup>4</sup> and throughout the Austronesian region from the languages of colonial powers (Chinese and Japanese in Formosan languages, Spanish and English in the Philippines, Dutch in Indonesia, Spanish and Japanese in Micronesia, and French and English in the south Pacific islands). Borrowing of this kind has also occurred in small-scale societies, as Dutton (1982a) has documented for a south-east Papuan case.

A third kind of contact-induced change occurs when, after a period of bilingualism, a group changes its first language, and features of the former first language are retained in the adopted language, for example, in the way they pronounce it.<sup>5</sup>

Contact-induced change also causes problems for the second method referred to earlier, lexicostatistics. The procedure in lexicostatistics is to collect a list of words for the same set of meanings from a number of languages, and for every pair of languages marking each pair of words as either “cognate” (i.e., the words with the same meaning in the two languages are deemed to be related) or “non-cognate”, and calculating the percentage of the items in the list which are deemed cognate for each pair of languages. This “cognate percentage” is then taken to be a measure of the degree of genetic relationship between the two languages: the higher the percentage, the closer the assumed relationship.

Apart from the difficulty of deciding whether words of similar meaning in two languages are in fact cognate,<sup>6</sup> the lexicostatistical method encounters the problem that words, like other features of language, may be subject to contact-induced change, that is, they may be borrowed by one language from its neighbour. Items of vocabulary will readily pass between two Austronesian languages which are not necessarily each other’s closest relatives, and thereby distort a lexicostatistical classification.

This difficulty is manifest when the comparative and lexicostatistical methods are applied to the same group of languages and give conflicting results. In a well-known study, Dyen (1965b) used lexicostatistics to derive a genetic tree of the Austronesian language family. However, a number of the groupings which Dyen proposed have not stood up under the magnifying glass of the comparative method.<sup>7</sup> Since the classical comparative method sets out to reconstruct the prehistory of the morphemes of a set of languages as well as their divergences, whereas the lexicostatistical method reconstructs only the history of language splits, the former method, complicated and time-consuming as it may be, is clearly preferable to the

latter, and it is therefore important to ask with regard to any classification of languages which method it is based on.

An extension of lexicostatistics known as “glottochronology” has also been applied in Austronesian studies. Glottochronology is based on the assumption that words associated with the non-cultural meanings in a lexicostatistical list are replaced at a constant rate over time, and that the lexicostatistical percentage of shared cognates for a pair of languages can therefore be used not only to ascertain the genetic relationships between them, but also to determine the date at which their parent language split into the two daughter-languages. However, if the lexicostatistical method is unreliable, the associated glottochronological method must also be unreliable (see Grace 1966). Blust (1981b) has demonstrated on the basis of a study of Austronesian languages that words are *not* replaced at a constant rate over time. Bellwood (1978: 125-126), seeking to date the break-up of Proto Oceanic (the language ancestral to all the Austronesian languages of Oceania) found a puzzling discrepancy between the glottochronological dating of its break-up to no later than 3000 B.C. and the archaeological dating of Austronesian-related artefacts from the area of the Proto-Oceanic homeland in western Melanesia, for which the earliest dates were only about 1500 B.C. The discrepancy is at least partly attributable to the unreliability of glottochronology.

In the comparative method, reconstruction and subgrouping are interdependent. A prerequisite for the tenability of any subgrouping hypothesis must be an adequate reconstruction of the proto language: subgrouping under the comparative method is based on innovations which have occurred in present-day languages relative to a proto language. If the reconstruction of the proto language is inadequate, then wrong inferences are likely to be made about innovations and consequently about subgrouping. Conversely, however, decisions about reconstruction are dependent on hypotheses about subgrouping.

An example will serve to illustrate this interdependence. Phonemes in a proto language are reconstructed from correspondences among sounds in the languages descended from it. In Table 1, cognate sets for six items are given across twelve Austronesian languages. Atayal, Tsou, Rukai, Paiwan, Amis and Bunun are all spoken in Taiwan; Tagalog in southern Luzon (Philippines); Toba Batak in north-western Sumatra (western Indonesia); Uma on Sulawesi (north central Indonesia); Manggarai on Flores (south central Indonesia); Kairiru on the island of the same name off the north coast of Papua New Guinea; and Samoan in the central Pacific. The words listed in Table 1 illustrate two sound correspondences. The words for ‘ear’, ‘eye’

and ‘head louse’ exemplify the correspondence between č in Atayal, ɕ in Tsou, Rukai and Paiwan, and *t* in the other eight languages. The words for ‘three’, ‘freshwater eel’ and ‘seven’ exemplify a second correspondence, between *c* in Paiwan and *t* in all the other listed languages. From these two sound correspondences, the two PAN proto-phonemes \**C* and \**t* are conventionally reconstructed, and we can attribute to them the probable phonetic values [ɕ] and [t].

This reconstruction both suggests and entails a subgrouping hypothesis. The lower eight languages in our sample all have *t* where Atayal has either č or *t* and Tsou, Rukai and Paiwan have either ɕ or *t*, that is, they share in the merger of the PAN proto-phonemes \**t* and \**C*. This suggests a hypothesis that these eight languages belong to a subgroup (but see below): they share a common ancestor in which the merger of \**t* and \**C* had taken place. But note that the reconstruction itself already entails such a hypothesis. An alternative hypothesis would be that PAN had only the proto-phoneme \**t*, which split in a common ancestor of Atayal, Tsou, Rukai and Paiwan into \**t* and \**C*. Whichever reconstruction is adopted, it entails an implicit subgrouping decision.

How can we escape this circularity? In the case of PAN,<sup>9</sup> we are dependent on evidence based on likely directions of phonetic change. Is it more likely that PAN \**C* [ɕ] and \**t* [t] merged as [t], or that PAN \**t* [t] split

into [ç] and [t]? A split would be the more likely hypothesis if it could be shown that [ç] was the outcome before high or front vowels and [t] elsewhere, since such splits are quite common in the world's languages. But the data show no such conditioning, leaving the merger as the more likely direction of change.<sup>10</sup>

In practice, decisions of this kind are rarely dependent on a single innovation. In the present case, the weight of evidence, both phonological and morphosyntactic, suggests that several innovations besides the merger of \*C and \*t should be attributed to the lower *six* languages of Table 1 and to all Austronesian languages outside Taiwan and that these languages form a subgroup which is labelled "Malayo-Polynesian" (Figure 1).<sup>11</sup> This decision leaves no innovations shared by all the languages on Taiwan, implying that they constitute several first-order subgroups of Austronesian. It is this decision which informs the reconstruction of PAN phonology below.

This example illustrates how reconstructing something of the phonetics of the proto-language is vital to subgrouping procedure. PAN \*C has been written thus by most scholars since Dyen (1965a), and there has been a tendency among Austronesian scholars (and among comparative linguists in general) to treat reconstructed proto-phonemes as algebraic cover symbols of unknown phonetic value, such that the actual choice of symbol is unimportant.<sup>12</sup> However, a consequence of this convention is that identifying the direction of phonetic change becomes impossible, and we have no means of knowing whether \*C > t or \*C > ts is an innovation, because the phonetic value of \*C is unknown. For example, Li (1985) adduces five shared innovations to show that the languages of the Atayalic group and several languages placed by other scholars in the Paiwanic group on the contrary share a common ancestor and therefore form a Northern Formosan subgroup. One of these innovations is that PAN \*C becomes ts or s. But as we have seen, this is probably not an innovation: the innovation occurs instead in those languages where \*C ([ç]) has become t.

The "algebraic" tendency in PAN reconstruction is rooted in its history. When Dempwolff (1934, 1937, 1938) initially reconstructed his *Ur-Austronesisch* ('Proto-Austronesian'), he used no Formosan data. As a result, what he reconstructed was what we would now call PMP. When Formosan data became available to Dyen, he added new proto-phonemes to Dempwolff's reconstructed system (see Dyen 1965a) to take account of his new insights. However, with these and other additions, the conventionally accepted PAN phoneme system became overloaded with symbols to which it was no longer possible to attach phonetic values.<sup>13</sup> Various scholars (Dahl

1973, 1981; Harvey 1982; Wolff 1974a, 1982, 1988) have protested at this overloading, and have attempted to reconstruct a plausible PAN phoneme system.

A second reason for the continued use of the “algebraic” notation is that it has come to be used for both PAN and PMP, and its use for both proto-languages facilitates comparison. However, if the phonological system of PMP differed significantly from that of PAN (as seems to be the case), then the use of the same orthography for both proto-languages is somewhat misleading.

---

### **Reconstructing Proto-Austronesian phonology**

Because of the importance of attributing phonetic values to the symbols used in reconstruction, this section is devoted to a presentation of these symbols and a discussion of their likely values. The views presented here differ in some respects from those of other scholars, and are certainly not the last word on the PAN phonology; on the contrary, they are presented in order to show that unresolved issues remain in this connection. A detailed account of academic debate about PAN phonology would require several chapters to itself. The issues under debate are discussed by Dahl (1973, 1976, 1981), Wolff (1974a, 1982, 1988), and in Blust’s (1976) review of Dahl (1973). Blust (1990b) includes a brief overview of the PAN phonological system and its putative phonetics. Ross (1991b) provides a more detailed account of some of the matters which receive comment here. There are a number of orthographic conventions used in the literature, and Table 2 provides equivalences between the orthographies of Dempwolff, Dyen (also used by Blust, Zorc and many other scholars), Tsuchida (1976), Dahl, and that adopted in the present discussion. Dyen’s system is the most widely used orthography, and provides the basis of the latter.

In attributing values to the symbols of the PAN orthography, it is assumed here that the languages of Taiwan represent several first-order subgroups of Austronesian and, as illustrated above, are of considerable importance for reconstructing PAN. Distinctions which Dempwolff reconstructed, but which do not occur in Formosan languages, are taken to be innovations which occurred in PMP (or later) and are not reconstructed for PAN. By the same token, distinctions not reconstructed by Dempwolff but warranted by the Formosan data *are* reconstructed here.<sup>15</sup> In Table 3, which summarises the data on which our interpretation of PAN phonology is based, these distinctions are marked by adding subscripts to Dyen’s orthography in the leftmost column.

Over the last twenty years scholars working in Formosan languages have done a great deal of careful comparative work, reconstructing proto-languages ancestral to the various Formosan language groups, and these largely provide the basis of the material in Table 3. Before this work became available, major difficulties in using Formosan data had been that the latter often contained errors, data from different dialects of a language were mixed, and the phonologies of individual languages were poorly understood (this is true of some of the material in Dahl 1973). The collection of comparative data and the reconstruction of lower-order proto-languages has greatly enhanced our understanding of Formosan languages, and the data underlying Table 3 are accessible in published form. Where relevant, these data have also been cross-checked against the lists in the present work.

For comparison's sake, the orthographies of the various sources represented in Table 3 have been replaced by a standard representation of their phonetic values. Two unbracketed symbols separated by a comma represent an apparent phonemic split: e.g. PAN \*S split in Proto-Atayal into \*š and \*h. Two symbols in square brackets represent allophones of the phoneme preceding the brackets: e.g. Thao ɖ has the allophones [ɖ] and [ɭ]. The bilabials and velars of the PAN phonological system shown in Table 4 are uncontroversial, except for \*g. Wolff (1973, 1982) has suggested that \*g

and *\*r* not be reconstructed. However, in any language there are phonemes which are used much less often than others, and it seems that the PAN consonants with lower functional load were *\*g*, *\*r* and *\*j*. Certainly, Formosan data require their reconstruction, and one item, *\*garuʃ* ‘comb’, contains both *\*g* and *\*r*.<sup>17</sup>

The dental/alveolar, alveolar affricate, palatal and retroflex — collectively the coronal — proto-phonemes are most easily discussed together. There is good evidence for the reconstruction of a contrast between dental/alveolar and retroflex coronals, at least in the cases of the voiced stops and the liquids. Note, however, that the phonemes to which a retroflex value is attributed here are not those which have been conventionally reconstructed as retroflex. At the same time, we find no direct Formosan evidence for the reconstruction of the conventionally recognised palatal consonants. Apart from the probable palatal *\*Z*, the conventionally reconstructed retroflexes and palatals are reflected only in extra-Formosan languages, and are therefore more appropriately reconstructed — if at all — either within the phonological system of PMP or in a descendant thereof. We return to this matter below.

The voiceless dental/alveolars *\*t* and *\*C* were illustrated and discussed above. Dahl (1976: 55-60) proposes that the Formosan data require the reconstruction of three voiced dental/alveolars, namely *\*d<sub>1</sub>* [d], *\*d<sub>2</sub>* [dz] and *\*d<sub>3</sub>* [ɖ]. The data in Table 3 support these with consistent correspondences among Formosan languages. Whilst only Proto-Paiwan has this three-way distinction (reflected in some present-day Paiwan dialects; Ho 1978), the contrast between PAN *\*d<sub>1</sub>* on the one hand and PAN *\*d<sub>2</sub>* and *\*d<sub>3</sub>* on the other is also reflected in Proto-Puyuma. The Formosan reflexes of *\*Z* are identical to those of *\*d<sub>1</sub>*, except in Proto-Rukai, where *\*Z* is reflected as alveolar /d/ and *\*d<sub>1</sub>* merges with *\*d<sub>2</sub>* and *\*d<sub>3</sub>* as retroflex /ɖ/. However, as Tsuchida (1976) and Dahl (1981: 98) note, correspondence between Proto-Rukai /d/ and PMP *\*Z* requires the reconstruction of PAN *\*Z*, probably a palatal stop or affricate. These matters are examined in more detail in Ross (1991b).

The phonetic values attributed to PAN *\*d<sub>1</sub>*, *\*d<sub>2</sub>* and *\*d<sub>3</sub>* are based on two factors. Firstly, the distinction between dental/alveolar and retroflex coronals is clear across a substantial portion of Taiwan (see Table 3), accounting for *\*d<sub>1</sub>* and *\*d<sub>3</sub>*. Secondly, the evidence of Paiwan /z/ and the reconstruction of the voiceless affricate *\*C* [tʃ] suggests that what we reconstruct as PAN *\*d<sub>2</sub>* [dz] was indeed the voiced counterpart of *\*C*.

Note that the retroflex *\*d<sub>3</sub>* of PAN in Tables 3 and 4 is not identical with the retroflex *\*ɖ* reconstructed by Dempwolff (see Table 2). Dempwolff

reconstructed both a voiceless retroflex *\*t̚* (Dyen's *\*T*) and a voiced retroflex *\*d̚* (Dyen's *\*D*), neither of which is separately reflected in the Formosan data: they seem to be the result of later developments from PAN *\*t* and *\*C* (Dahl 1981: 22-25) and PAN *\*d<sub>1</sub>*, *\*d<sub>2</sub>* and *\*d<sub>3</sub>*. It is mildly surprising that a retroflex voiceless stop is not reconstructible in PAN, but the only case of such a segment in Table 3 is Proto-Puyuma *\*t̚*, reflecting PAN *\*C*, and the latter's reflexes in Saisiyat /s/, Thao /θ/, and Proto-Rukai/Proto-Puyuma *\*t̚* all imply that PAN *\*C* was dental.

The two contrasting liquid proto-phonemes shown in Tables 3 and 4 as PAN dental/alveolar *\*L* and retroflex *\*l̚* have been recognised since Dyen (1965a). The difference in point of articulation between these two liquids is clear from Table 3. It is also clear from the table that PAN *\*l̚* was a lateral, contrasting with PAN *\*r*, a trill at the same dental/alveolar point of articulation. The reflexes of *\*l̚* in Table 3 imply that it had both lateral [l] and non-lateral [r̥] allophones. It is unfortunate that the symbol *\*L* has come to be used for the dental/alveolar liquid and *\*l̚* for the retroflex: this is an artefact of the history of PAN reconstruction.

It is also appropriate to note at this point that the PAN dental/alveolar trill *\*r* contrasted with what was apparently a uvular trill *\*R*. PAN *\*R* has three kinds of reflex throughout much of the Austronesian world: liquid (some variety of *r* or *l*), deletion (as in Proto-Paiwan), or a velar (as in Proto-Atayal and many Philippine languages). It is a ready inference from this that *\*R* was a liquid with a weak (easily subject to deletion) dorsal articulation, a description best filled by the uvular trill.

PAN *\*s* and *\*j* (Dempwolff's *\*t'* and *\*g'*) have been widely assumed to be palatals, and to be members of a palatal set which also includes, in Dyen's orthography, *\*c*, *\*z*, and *\*ñ*. However, among the Formosan languages in Table 3, only Proto-Paiwan has phonemically distinct palatal consonants, and these do not reflect PAN palatal proto-phonemes. Hence there is no Formosan evidence for the reconstruction of PAN palatals other than *\*Z* (discussed above),<sup>18</sup> and it appears that the extra-Formosan evidence for these palatal proto-phonemes reflects changes which occurred in PMP and/or after its break-up. Of these putative palatals, *\*c*, *\*z*, and *\*ñ* did not occur syllable-finally, but *\*s* and *\*j* did (Blust 1990b). The segments *\*c*, *\*z*, and *\*ñ* are not distinctively reflected in Formosan languages, whilst Dyen's *\*s* and *\*j* are better interpreted as dentals [s] and [z]. The following paragraphs show why.

The Proto-Paiwan palatals *\*c*, *\*j*, and *\*l̚* (retained in the Butanglu, Tyuabar and Tyuvuali dialects of Paiwan; Ho 1978) and the dental/alveolars *\*t* and *\*d* represent an interesting reconstructive conundrum. The Proto-Paiwan

palatals correspond with dental/alveolar segments in other Formosan languages and reflect the PAN dental/alveolar proto-phonemes *\*t*, *\*d*, and *\*L*, whilst the Proto-Paiwan dental/alveolars reflect what have traditionally been reconstructed as *palatals* (*\*s* and *\*j*). Under this interpretation of PAN phonology, the PAN dental/alveolar and PAN palatal sets have changed places in Proto-Paiwan — a swap for which it is very difficult to find a plausible motivation. If, however, there were no PAN palatals other than *\*Z*, this problem disappears. Since the Proto-Paiwan palatals reflect the palatalisation (i.e. a backward shift in point of articulation) of PAN dental/alveolars, it is likely that the the Proto-Paiwan dental/aveolars result from a drag chain effect whereby the vacated dental/alveolar slots in the system were filled either by a second backward shift in point of articulation or by a change in manner of articulation, or both. This allows two hypotheses. Either *\*s* and *\*j* were articulated further forward than the dental/alveolars, i.e. they were fronted dental or interdental, and/or they were continuants. Apart from Proto-Paiwan, the weight of evidence indicates that their point of articulation was well forward *and* that they were continuants, either [ʃ] and [ʒ] or [θ] and [ð]. Since *\*s* becomes Atayal, Saisiyat /h/ and Saaroa zero (probably via [h]), and [s] to [h] is a common sound change, [ʃ] is the more natural value to attribute to *\*s*. Hence we posit the two-stage change below:

- |                                     |   |  |
|-------------------------------------|---|--|
| 1. PAN <i>*t, *d, *L</i> [l]        | > | Proto-Paiwan <i>*c, *J, *l<sup>y</sup></i> |
| 2. PAN <i>*s</i> [ʃ], <i>*j</i> [ʒ] | > | Proto-Paiwan <i>*t, *d</i>                 |

The attribution of a dental value to PAN *\*j* follows from the Paiwan evidence referred to above, and is supported by its reflection as Thao /ð/ and Saisiyat dental /z/. The velar reflexes in Proto-Atayal and Proto-Rukai are less readily explained, until it is recognised that Proto-Atayal *\*γ* is but one of several possible interpretations of the Atayalic correspondence set, which includes word-medially [r], [s], [w] and [g] and word-finally [y], [s], [ʔ] and [g] (this proto-phoneme, which Li 1981 labels as *\*g'*, does not occur word-initially). It can be plausibly derived from a lateral fricative, which is perceptually quite similar to and derivable from an interdental fricative.

The proto-phoneme which Dyen (1965a) wrote as *\*S* subsumed several overlapping correspondence sets, which Dahl (1981: 26-39) has reduced to two, labelled by him *\*S<sub>1</sub>* and *\*S<sub>2</sub>*. Dahl regards these as two separate phonemes, but this is questionable, since they are reflected identically in Paiwan (as *s*) and in several other Formosan languages. The Formosan sound correspondences for *\*S<sub>1</sub>* show that it was phonetically something like [s] or [ʃ]. The Formosan reflexes of *\*S<sub>2</sub>* are either [s], [h] or zero.<sup>19</sup> Since changes

from [ʃ] to [s], from [s] to [h] and from [h] to zero are quite common among the world's languages, it is probable (as Zorc 1982 suggests) that the reflexes of \*S<sub>2</sub> represent a sound change from [s] to [h] in some but not all relevant vocabulary items,<sup>20</sup> i.e. that they reflect the same PAN proto-phoneme as \*S<sub>1</sub>. Hence they are here both treated as \*S.

If we are correct in attributing the phonetic value [ʃ] to PAN \*s, then \*S must be a sibilant with a different point of articulation. The modern reflexes suggest that it was a lamino-alveolar, [ʃ]. This is certainly possible, but since a distinction between dental/alveolar and retroflex consonants was clearly present in PAN, it is more economic to attribute to it the perceptually similar retroflex value [s].

One small area of controversy remains with regard to the sibilants. Dyen (1971) and Tsuchida (1976) recognise two phonemes \*s and \*θ where I have reconstructed PAN \*s. Tsuchida argues that the two are reflected separately in Maanyan and Malagasy, but Dahl refutes this (1981: 80-82). However, he agrees that the two phonemes must be reconstructed in PAN on the strength of their different reflexes in Kakanabu, Saaroa and Rukai, with [θ] as the probable articulation of \*θ (1981: 83). I have not accepted this argument, since the three languages all belong to the same putative Formosan subgroup, Rukai-Tsouic.

The hypothesis that PAN did not have a full set of phonemically palatal consonants also receives support from morpheme-structure evidence. Uhlenbeck (1949, 1950) showed that it is a general principle of Javanese morpheme structure that in a morpheme of the canonical shape C<sub>1</sub>VC<sub>2</sub>V[C], the segments C<sub>1</sub> and C<sub>2</sub> may have the same point of articulation only if they are identical (i.e. *p-b*, *p-m*, *b-m*, *b-p*, *m-p*, *m-b* do not normally occur, but *p-p*, *b-b*, *m-m* do occur). Thus we may say, using an expression from Mester (1988), that the bilabials *p*, *b*, *m* form an "exclusion set". The coronals and velars also form exclusion sets. Adelaar (1983, 1985: 122-125) shows that similar morpheme-structure constraints also applied to Proto-Malayic and probably also to PMP; Clynes (1990) has shown that such constraints occur in Paiwan, and he suggests that they may therefore be reconstructible for PAN. However, if the PMP (and post-PMP) palatals developed from the PAN coronals, we would expect these palatals to form an exclusion set with the coronals, rather than an exclusion set of their own. This hypothesis is confirmed by Mester's (1988: 94, 162-164) statistical analysis of morpheme structure, which shows that in Javanese the coronals and palatals form a single exclusion set.

The reconstruction of the three postvelar phonemes \*q, \*h and \*ʔ may appear odd at first sight. However, such a three-way contrast occurs in

languages scattered in various parts of the world, as the data in Maddieson (1984) show.<sup>21</sup> Zorc (1982) shows that the three proto-phonemes are reflected by distinct correspondence sets in Taiwan (where Amis and Bunun both reflect them as /q/, /h/ and /ʔ/), the Philippines and western Indonesia.

The PAN consonant system reconstructed in Table 4 may also appear somewhat eccentric in its overall structure to some readers. However, if a reconstructed phonological system pretends to some sort of realism, we should expect it to resemble the phonology of real languages. Although Dempwolff (1934: 13-23) set out to reconstruct a “symmetrical” system for PMP, and Wolff (1988) attempts something similar for PAN, the consonant systems of real languages are often eccentric in their structures, and the reconstructed PAN system resembles one of these.

The reconstruction of the PAN system of four vowels (\*i, \*u, \*e, \*a) and four word-final diphthongs (\*-iw, \*-uy, \*-ay, \*-aw) (Table 4) is uncontroversial. Some scholars have suggested that \*-ey and \*-ew should also be reconstructed (Dyen 1965b, Nothofer 1984), but they are indistinguishable from \*-ay and \*-aw in Formosan languages, and are therefore not reconstructed here.

Many languages of the Philippines show contrasts between long and short vowels, and Zorc (1978, 1983) has shown that for a number of languages in which the long/short contrast is limited to the vowel of the penultimate syllable this is best explained by the reconstruction of word stress (which, however, he writes as vowel length). Roots either have word stress on the penultimate syllable (reflected in relevant Philippine languages by a long vowel) or on the final syllable (no long vowel occurs in the root). Recent work suggests that Zorc’s system is reconstructible for PAN, since there are relics of it in a few Formosan languages (Ross 1991b).

The canonical shape of PAN roots has long been held to be CVCCVC, where each consonant is optional.<sup>22</sup> The majority of reconstructed roots are disyllabic, although trisyllables also occur. Monosyllabic roots (as opposed to grammatical morphemes) occur only in reduplicated form, giving disyllables. Dempwolff (1934: 28) divided roots with a medial -CC- sequence into two categories: those in which the sequence resulted from reduplicating a monosyllable, like \*-rg- in PAN \*gergér ‘tremble’, and those in which the sequence consisted of a nasal and a stop at the same point of articulation, like \*-nd- in PAN \*\*pandan ‘pandanus’ (the double asterisk indicates this is not considered a correct reconstruction). In a number of reconstructions of the latter type, Dempwolff and others since have written the nasal phoneme in brackets because it occurs in some reflexes but not others. Thus we find reconstructions like PAN \*\*ma(n)taq ‘green, unripe’ to account for Paiwan macaḱ, Yami mata, Isnag na-māta, Balinese matah, Proto-Oceanic (POC)

\**mataq* but Malagasy *manta*, Acehnese *muntah*, Javanese *məntah*; PAN \*\**Cu(m)buq* ‘grow, sprout’ to account for Saaroa *ɕuvuʔu* ‘bamboo shoot’, Paiwan *ɕuvuk*, Tagalog *tūbo*, but Malagasy *-tumbu*, Acehnese *tumbōh*, Indonesian *bər-tumbuh*, Balinese *tumbuh*, POC \**tubuq*; and PAN \*\**qe(n)tut* ‘break wind’ to account for Paiwan *ɕæcuc*, Yami *atot*, Tagalog *utot* but Balangingi Sama *untut*, Murut *antut*, Indonesian *kəntut*.

Apart from the fact that the theory which allows the insertion of an “optional nasal” is not well motivated, examination of Formosan and other data suggests that the canonical shape of PAN roots was in fact CVCVC, i.e. that the only syllable-final consonants occurred at the end of the root, and that medial consonant sequences in daughter-languages can be accounted for in three basic ways.

The first of these was mentioned above: when monosyllabic roots of the form CVC were reduplicated, they resulted in forms like \**gerger*. It is noteworthy, however, that in those Formosan languages which add an extra vowel after an original final consonant (for example, Mantauran Rukai *-kan-ə* and Kanakanavu *-kaən-ə* from PAN \**káʔen*), the extra vowel is added after *both* occurrences of the reduplicated monosyllable: Mantauran Rukai *-hər-ə* *hər-ə* and Kanakanavu *-kər-ə* *kər-ə* from PAN \**ger-ger* ‘tremble’. This suggests that in PAN these reduplications were treated phonologically as the repetition of a root, not as a lexical compound.

The second source of medial consonant sequences is PAN trisyllables of the form CVCVCV(C) with an unstressed penultimate syllable whose vowel is subsequently lost, giving CVCCV(C). Thus the source of forms like Ilokano *paŋdan* ‘pandanus’, Isn *paŋdān* ‘k. o. screw pine’, Tagalog *pandan* ‘pandanus’, POC \**padran* is not a putative PAN \*\**pandan* ‘pandanus’, but PAN \**paŋud,aL*, as indicated by Formosan reflexes: Budai Rukai *paŋoɖalə* ‘pineapple’, Paiwan *paŋuɖalʔ* ‘pineapple’. In this example the resulting CC- sequence consists of nasal + stop, but other sequences can also result from this process, which is plentifully exemplified by Blust (1982b).

The third source of medial consonant sequences, referred to in the literature as “nasal infixation”, is less easily explained. Cognate sets like that given with PAN \*\**Cu(m)buq* ‘grow, sprout’ require a different explanation from those above. The fact that the “infix nasal” (Dempwolff called it an “optional nasal”) never occurs in Formosan languages indicates that the PAN form should be reconstructed without it: \**Cúbuq*. It is noteworthy that items in which the infix nasal occurs mostly seem to have been PAN verbs, and that it does not occur consistently in Philippine cognate sets, i.e. its presence seems to be the result of borrowing, perhaps from Malay, since the nasal is

prone to occur in languages of western Indonesia. This is a matter which urgently needs research: since the nasal is reflected in some POC items, it was probably (as Dempwolff 1934: 109 notes) the result of a verbal infixation process in a proto-language of quite high order. But since the process does not seem to regularly affect Philippine languages, that proto-language was not PMP. If this is found to be an innovation which defines a large Austronesian subgroup, then it may contribute importantly to our understanding of Austronesian prehistory. Reid (1982) has used this innovation to define a subgroup, and we return to this below.

Considerable space has been devoted here to the reconstruction of PAN phonology, because this is the area of PAN reconstruction in which most work has been done and in which most reconstructive issues have been raised. A much smaller amount of work has been done on the reconstruction of PAN grammar.

### Reconstructing Proto-Austronesian grammar

There is an urgent need for more comparative-historical work on Austronesian morphosyntactic and verbal systems. Those of some of the languages of Taiwan, the Philippines and western Indonesia constitute quite unusual structural types among the world's languages. A plausible PAN reconstruction, outlined below, has some of the more unusual features of a number of these languages, and work is needed in order to support or refute this reconstruction. In any case, the PAN system has given rise to a plethora of different systems in modern Austronesian languages, and careful reconstruction of their histories would not only provide copious examples of how grammars change, but would probably also cast additional light on the subgrouping of Austronesian languages.

A number of Austronesian languages in Taiwan, the Philippines and parts of western and northern Indonesia retain what was probably the verbal system of PAN: this has come to be known as the system of "topic" and "focus", but because these terms have many conflicting uses among grammarians, they will be avoided here. Instead of "topic", we will use the term "pivot", following Foley – van Valin (1984). The following Squaliq Atayal examples, from Ferrell (1972), illustrate this system (for a Philippine example, see Tryon, this volume).

- a) *k<m>alup saku? bziok ryiax*  
 <AP>hunt PV:IS boar mountain  
 'I am hunting boar in the mountains.'

- b) *ḵlup-un makuʔ ryiax bziok*  
 hunt-UP GEN:1S mountain boar  
 ‘The boar is being hunted by me in the mountains.’
- c) *ḵlup-an makuʔ bziok ryiax*  
 hunt-LP GEN:1S boar mountain  
 ‘The mountains are having boar hunted in them by me.’
- d) *s-ḵalup makuʔ bziok lalau qani*  
 IBP-hunt GEN:1S boar knife this  
 ‘The knife is being used to hunt boar by me.’

The clumsiness of the English sentences below the examples reflects the attempt to capture by quasi-literal translation something of the sense of the Atayal. In this system, each sentence has a pivot (translated as the English subject): the pivot is always definite, i.e. the speaker refers to it in such a way as to indicate that the hearer knows its identity (this is a function of English *the*), and it normally refers to an entity that has been previously mentioned. English, however, has only two subject options — the active *I am hunting* (actor *I* is subject) and passive *The boar is being hunted* (undergoer *the boar* is subject). Atayal, on the other hand, has four pivot options — the actor, the undergoer, the location and the instrument or beneficiary. An affix on the verb indicates what relationship the pivot has to the verb: <*m*> actor pivot (AP), *-un* undergoer pivot (UP), *-an* location pivot (LP) and *s-* instrument or beneficiary pivot (IBP). The noun phrase which is in the pivot relationship to the verb is sentence-final, except when it is a pronoun, as in (a), in which case it occupies the normal pronoun position after the verb, but its form *sakuʔ* indicates that it is the pivot (PV; 1S = first person singular) rather than a non-pivot marked by the genitive (GEN) form *makuʔ*.<sup>23</sup> An important difference from English is that Atayal is a discourse-ergative language: the event line in a narrative is carried by transitive clauses in which the most usual pivot is undergoer, not actor as in English (see McCune 1979, Hopper 1979a, 1979b, 1983, 1988, Wouk 1986, Cooreman – Fox – Givón 1984).

The Atayal system outlined here is very similar to the probable PAN system, which had the four affixes: \*<*m*> ‘AP’, \**-en* ‘UP’, \**-an* ‘LP’ and \**Si-* ‘instrument pivot’ (IP) (Starosta – Pawley – Reid 1982).<sup>24</sup> The one respect in which the PAN system probably differed from Atayal was that it used not only different pronoun forms but also different noun phrase markers to indicate the relationship of the noun phrase to the verb, thereby allowing greater freedom of phrase order in the sentence. A Paiwan equivalent of (d) above illustrates these markers (Ferrell 1972):

*ku si-kaɫʷup a vuluŋ tua vavuy*  
 GEN:1S IP-hunt PV spear NPV pig

‘The spear is being used to hunt boar by me.’

Here Paiwan *a* ‘PV’ and *tua* ‘non-pivot (NPV)’ reflect the PAN noun phrase markers *\*a* ‘PV’ and *\*sua* ‘NPV’ respectively. The instrument pivot marker *si-*, a reflex of PAN *\*Si-*, indicates that the noun phrase marked by *a* is the pivot of the sentence and is semantically the instrument of the verb.

Starosta – Pawley – Reid (1982) suggest that these affixes were originally nominalisers, which had been or were being reinterpreted as pivot-marking affixes at the time that PAN was breaking up (or they were thus reinterpreted independently in a number of daughter-languages). Under this hypothesis, the phrase *klup-un makuʷ* meant ‘my hunted thing’, and the original meaning of the whole sentence was something like ‘The boar was my hunted thing of the mountains’. According to Pecoraro’s (1979) description of Sediq, a language closely related to Atayal, this ambiguity between nominalisation and verbal pivot marking still exists today. Certainly reflexes of the affixes *\*-en*, *\*-an*, and *\*Si-* often have meanings derived from their PAN sense, respectively ‘something being X-ed’, ‘place where one X-es’ and ‘thing one X-es with’. A further affix, PAN *\*<in>*, meant ‘something already X-ed’, and has assumed the function of a verbal perfective marker in many modern languages.

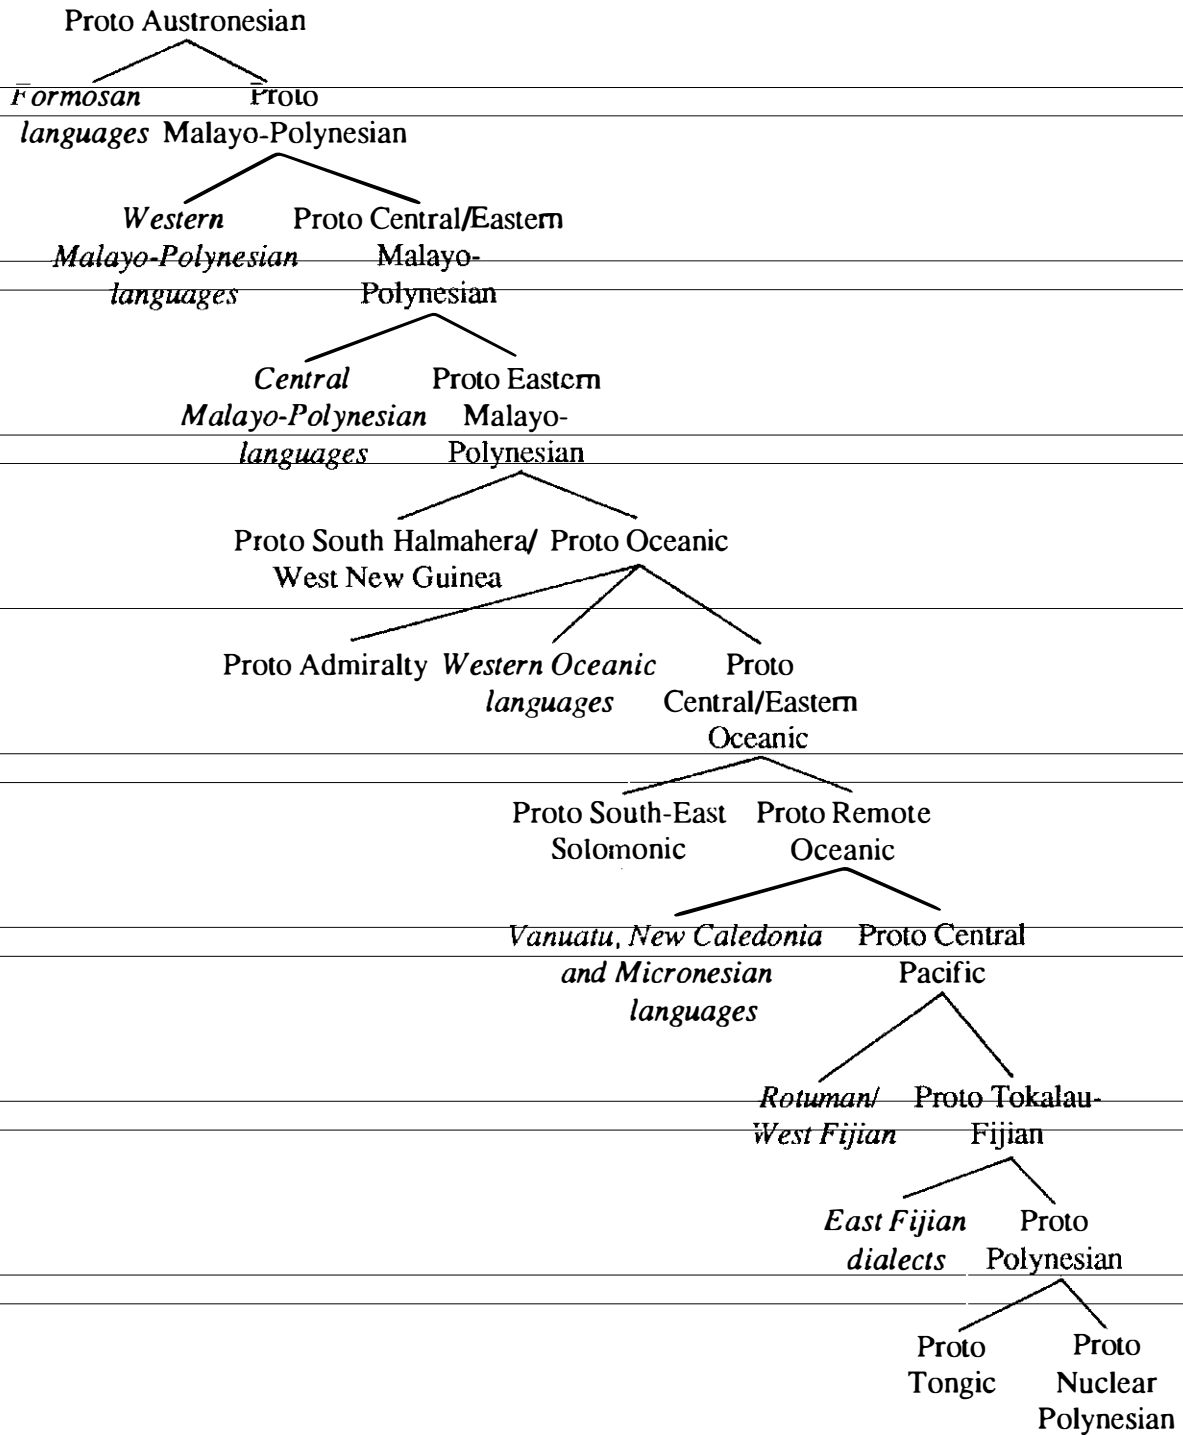

This set of affixes appears to be historically secondary, and to have been imposed on an earlier, primary system. One reason for thinking that it is secondary is that it consists of a mixture of a prefix, infixes and suffixes, an indicator that a system has been constructed from affixes which originally had other functions. The primary system, which in PAN seems to have been used only for imperative and irrealis verbs, consisted entirely of suffixes: *\*-a* ‘AP imperative/irrealis’, *\*-u* ‘UP imperative’, *\*-aw* ‘UP irrealis’, *\*-i* ‘LP imperative’, and *\*-ay* ‘LP irrealis’. The suffix *\*-aw*, for example, is reflected in Paiwan *ku kaɫʷup-aw* ‘I’ll probably hunt’ (Ferrell 1982). There has been relatively little discussion of *\*-a*, *\*-i*, and *\*-ay* in the literature and apparently no discussion of *\*-u* and *\*-aw*. Wolff (1973) refers to *\*-a*, *\*-i*, and *\*-ay*, and Starosta – Pawley – Reid (1982) refer to *\*-a* and *\*-i*.

## Issues in Austronesian subgrouping

Tryon (this volume) sketches some present views of Austronesian subgrouping. However, the tree diagrams in Figures 1 to 8 are not only subject to the methodological *caveats* discussed earlier: they encapsulate hypotheses which vary widely in quality when they are assessed by the criteria of the comparative method. The method of subgrouping languages on the basis of the innovations which they share relative to a proto language is obviously recursive in its application. Thus Figure 1 shows the primary subgroups of Austronesian languages which developed out of PAN. Figure 2 shows the major subgroups which developed from one daughter-language of PAN, namely PMP. It follows that just as the primary subgroups in Figure 1 need to be determined relative to PAN, so too the highest-order subgroups in Figure 2, namely Western Malayo-Polynesian and Central-Eastern Malayo-Polynesian, need to be determined relative to PMP — and so on down through the tree diagrams in Figures 2 to 8. The purpose of the current section is to give some assessment of the quality of the various hypotheses implicit in those diagrams.

A fairly consistent pattern can be discerned in Figures 1, 2, 6, 7 and 8, which is summed up in Figure 10. At each node is the language of a settled population: the right-hand or right-most branch from each node represents the speech of a segment of that population which migrated from the settled area, so that a new language arose by divergence as a result of that separation. The one case in which a clean separation of the right-hand branch probably did not occur is Proto-Tokalau-Fijian, to which I return below. Together the right-hand nodes represent the main migratory path of Austronesian speakers from Taiwan to Polynesia. What is of note, however, is that most of the left-hand branches do *not* appear to represent a discrete proto language, since they represent the “stay-at-homes”. It seems — and we would expect this to be the case — that in most of the cases of separation represented by the nodes in Figure 10, the settled proto language had already diversified into a local linkage before separation occurred. In these cases, the dialects or languages of the stay-at-homes have no exclusively shared ancestor; instead they share only an ancestor at the node above with the language of the departed migrants.

The difficulty of subgrouping the languages of stay-at-homes was examined above with regard to the first Austronesian separation, namely that of Proto-Malayo-Polynesian from the Austronesian linkage on Taiwan. Whilst there is a fair measure of agreement about lower-order subgroups of the stay-at-home languages on Taiwan, there is much less agreement about their higher-order groupings. Scholars agree about the small *Atayalic*,

*Figure 10.* Schematic diagram of the diversification of Austronesian languages

*Tsouic*, *Rukaic* and *Paiwanic* groups. Detailed comparative work and reconstruction has been carried out for the Atayalic (Li 1980, 1981, 1985), Tsouic (Tsuchida 1976) and Rukaic (Li 1977) groups, and Tsuchida (1976: 10-12, 216-218) has also shown that the Rukaic and Tsouic probably group together as Rukai-Tsouic. There is general agreement that the Paiwanic group consists minimally of Paiwan, Puyuma, Amis and Bunun. Beyond this, however, there is little agreement about the subgrouping of Formosan languages, with Tsuchida (1976, repeated in Wurm – Hattori 1983, map 30) and Li (1985) providing quite different genetic trees. The determination of higher-order groups among the Formosan languages is hampered by the fact that many languages have become either extinct or heavily sinicised since the Chinese annexation in the late seventeenth century, with the result that investigators are dependent either on poorly recorded written materials or on data from dying languages. Another difficulty obstructing the subgrouping of Formosan languages is that, because these are stay-at-home languages, it is quite likely that the lower-order subgroups have developed out of a dialect linkage and are *ipso facto* incapable of being subgrouped. Although Tsuchida (1976: 13) points out that the Formosan languages all appear to share certain retentions not shared by Malayo-Polynesian languages, this is not evidence for a Formosan subgroup of Austronesian languages. Rather, the features in which all Malayo-Polynesian languages appear to share innovations are evidence for the unity of the Malayo-Polynesian subgroup.<sup>25</sup>

Circumstantially, it is almost certain that PAN had diversified into a linkage of dialects and/or languages before speakers of what was to become PMP left Taiwan. It is therefore relevant to ask from which part of the linkage this pre-PMP broke off. In the discussion of Table 1, it was noted that the Formosan languages Amis and Bunun share with PMP the merger of PAN \*C and \*t. If one or both of them were found also to share other innovations with PMP, then we would have a probable source for pre-PMP.<sup>26</sup> However, research in this direction remains to be done.

The unity of the *Malayo-Polynesian languages* is probably not open to serious question, and Proto-Malayo-Polynesian is readily reconstructible. Blust (1977) argued that Malayo-Polynesian languages share certain innovations in pronoun forms which are not found in Formosan languages. In particular, Malayo-Polynesian languages reflect the “second Austronesian politeness shift”, whereby the morpheme \*-*mu* ‘you (plural)’ came to be used as a polite alternative to \*-*Su* ‘you (singular)’ to mark the possessive. This was apparently followed by the unexplained addition of \*-*i-Su* ‘you (singular)’ to \*-*kamu* ‘you (plural)’ to form a compound alternant (\**kamu-i-Su*) to the latter. Another innovation which is reflected right across the

Malayo-Polynesian region is the use of the PMP verbal derivational prefix *\*paN-*, and *\*maN-* (< *\*p<m>aN-* where *\*<m>* is the actor pivot infix discussed above), to form verbs where the actor is the pivot from verbs where the undergoer is pivot and from other items. The *-N-* represents a nasal segment which often coalesces with the root-initial consonant to form a nasal. In Tagalog, for example, *maN-* combines with the root *sakit* 'be sick' to form the verb *manakit* 'injure', and with *tālo* 'defeated' to form *manālo* 'win (a prize)'. In standard Malay, *məN-* combines with *ikut* 'be followed' to form *mənikut* 'follow'. This innovation is mentioned by Dahl (1976: 127-128) and Reid (1982: 211). Its reflexes are ubiquitous in western Malayo-Polynesian languages. However, they are also preserved in fossilised form in Oceanic languages (Ross 1988: 39-43), indicating that the innovation must have occurred in Proto-Malayo-Polynesian. Another pair of infixes with a similar function is *\*maR-* and *\*paR-*, but they occur in this function over a narrower area.

Malayo-Polynesian languages also share in a number of phonological innovations relative to PAN. Ideally, it would be desirable to tabulate evidence concerning the phonetic values of PMP phonemes in much the same way as we did for PAN phonemes in Table 3. However, enough is not yet understood about Malayo-Polynesian subgrouping for this to be feasible, and so Table 5 shows the correspondences between the reconstructed PAN, PMP and POC systems, together with reflexes in four western Malayo-Polynesian languages. The POC system is included because it disambiguates local, western Malayo-Polynesian innovations from PMP.

The conventionally accepted PMP innovations are (Blust 1990b):

- a) PAN *\*C* and *\*t* merged as PMP *\*t*.
- b) PAN *\*L* and *\*n* merged (with some unexplained exceptions)<sup>27</sup> as PMP *\*n*.
- c) PAN *\*S* became a glottal spirant of some kind, but did not merge with *\*h*. However, the reconstruction of PAN phonology above rejected some conventionally accepted features on the grounds that they were reflected only in Malayo-Polynesian languages, and not in Formosan, and were therefore PMP (or lower-order) innovations. Hence the list of PMP innovations grows.
- d) PAN *\*d<sub>1</sub>*, *\*d<sub>2</sub>* and *\*d<sub>3</sub>* merged as PMP *\*d*.
- e) PMP acquired a palatal nasal *\*ñ*.

Table 5. Correspondences between the PAN, PMP, some western Malayo-Polynesian and the POC phoneme systems

The phoneme which Dempwolff symbolised as \**d*' and which Dyen writes as \**z* is not found in basic vocabulary and has no good Formosan cognates. Its reflexes are limited to western Indonesia, and it is assumed to be a local phenomenon, probably spread through borrowing.

The phoneme which Dempwolff symbolised as \**k*' and which Dyen writes as \**c* has an even more limited distribution. It is distinguished from \**s* only by Javanese, Malay, Acehnese and in loan words in Malagasy. Blust (1988a: 47) argues tentatively that the presence of \**c* in six monosyllabic roots (in the sense discussed in the previous section) supports its attribution to PAN, since this is unlikely to be due to borrowing; however, he admits that the argument is weak.

Dempwolff also reconstructed the two retroflex phonemes now written as \**T* and \**D*. These have clearly separate reflexes (retroflexes) only in Madurese, Javanese and Balinese, and apparent differences in reflexes in other languages are now usually attributed to borrowing from Sanskrit. Blust (1990b) omits them from his paradigms of PAN and PMP reflexes. PMP \**ñ* is indisputably reconstructible. It appears to be a PMP innovation, however, since there are no separate reflexes of it in Formosa. A survey of the PAN items containing \**ñ* listed by Tsuchida (1976) reveals that there are very few of them and that the Formosan correspondences are more consistently interpreted as reflexes of PAN \**n* or \**L* (which became PMP \**n*) followed by a high vowel.

It was mentioned above that some scholars have reconstructed the PAN diphthongs \**-ey* and \**-ew* but that these are not supported by the Formosan evidence. Since they are reflected differently from \**-ay* and \**-aw* only in a few languages of western Indonesia (Malay, Sundanese, Madurese and Javanese), they appear to represent a local development, and are therefore also not reconstructible in PMP.

The left-hand branch of Malayo-Polynesian in Figures 2 and 10 is *Western Malayo-Polynesian* (see Maps A and B). As the lack of stratification in Figure 3 implies, we know unsatisfyingly little about the subgrouping of Western Malayo-Polynesian languages, and, as Blust (1985) concedes, there is no evidence that languages assigned to "Western Malayo-Polynesian" form a single Austronesian subgroup (although terms like "Western Austronesian" and "Western Malayo-Polynesian" have often been used in the literature as if these languages did form a genetic unity).

Indeed, Reid (1982: 211-213) has suggested that the *South Mindanao* (his Bilic) subgroup, shown in Figure 3, seems to lack some of the innovations characteristic of Malayo-Polynesian languages and may be descended from "a very early migration south of Formosa by an Austronesian-speaking

people". If this were true, then the South Mindanao group would be coordinate with the Atayalic, Rukai-Tsouic and Paiwanic groups of Taiwan. However, the South Mindanao group does reflect the second Austronesian politeness shift, and Blust (1991) points out that some of its atypical features are retentions, not innovations, and are not grounds for exclusion from Malayo-Polynesian. Reid (personal communication) suggests that the idiosyncrasy of the South Mindanao languages in comparison with their neighbours is probably to be attributed to the influence (presumably through language shift) of now defunct Negrito languages spoken in the Philippines before the arrival of Austronesian speakers.<sup>28</sup>

Students of Philippine languages have traditionally spoken of a "Philippine" subgroup that includes all languages of the Philippine archipelago (except the Sama-Bajaw "sea gypsy" languages), the languages of the Batan Islands between the Philippines and Taiwan, and several groups of languages spoken in the northern arm of Sulawesi, namely Sangiric, Minahasan and Gorontalo-Mongondic. These are often taken to be descended from "Proto-Philippine" (Zorc 1986). However, this grouping has been assumed on typological grounds (as evidenced by the "Proto-Philippine" reconstructions in Wurm – Wilson 1975) rather than justified. Two attempts have been made to justify it on the basis of the comparative method, by Charles (1974), who also includes within the Philippine subgroup the North-East Borneo group, and by Zorc (1986). Reid (1982: 202-203) points out that the innovations which Charles lists as shared by the languages of his Philippine subgroup are based on features of PAN phonology which "do not stand close scrutiny" (and which are not included in the reconstruction of PAN phonology above). Instead, Reid proposes a major Malayo-Polynesian subgroup including all languages in which nasal infixation occurs (see above): he takes this to include perhaps all Malayo-Polynesian languages *except* those of the Northern and Southern Philippine and South Mindanao groups. Since this would leave the Meso-Philippine group and most or all other Malayo-Polynesian languages in the nasal infixation subgroup, but exclude the rest of the Philippines, there could clearly be no Philippines subgroup and no reconstructible "Proto-Philippines".<sup>29</sup> This argument is difficult to evaluate, however: as we observed earlier, the nasal infixation process seems to have its centre in western Indonesia and its nature and distribution are not yet known.

Reid's hypothesis is challenged by Zorc (1986), who argues for a discrete Philippine grouping on the basis of a large number of putative lexical innovations shared by languages in the Philippine archipelago. It is also difficult to assess Zorc's position, because of the need to demonstrate that his

lexical innovations are not in fact vocabulary items which have been retained from, say, Proto-Malayo-Polynesian (but lost in extra-Philippine languages) and which have gained currency across the Philippine archipelago as a result of language contact. In this connection it is worth noting Reid's (1982: 212) comment, "As one moves south in the Philippines ... the degree of influence of one or more of the central Philippine languages becomes more and more pervasive, so that it becomes more and more difficult to separate the strata in the languages."

The possible fragmentation of the Philippine languages into genetically distinct Malayo-Polynesian subgroups extends the already lengthy list of groupings which fall under the cover term "Western Malayo-Polynesian". For ease of discussion I will divide the "Western Malayo-Polynesian languages" of Figure 10 into twenty-four groups rather different from those of Figure 3 (the latter are also used in the "Listing of Austronesian languages" in this volume). They are discussed below, together with a statement of the representative languages of each group for which word lists are given in this volume. It should be understood, however, that the grouping together of certain languages does not necessarily entail a commitment to their genetic unity, but is a device for highlighting the "current issues" with which this essay is concerned. The numbers and names in italics refer respectively to map numbers and to language groups in Wurm – Hattori (1981, 1983). The twenty-four groups are:

- 1) *Batanic (30, 32: Batanic or Ivatan group)*
- 2) *Northern Philippines (32: North Philippine group)*
- 3) *Meso-Philippines (32-33)*
- 4) *Southern Philippines (33-34)*
- 5) *South Mindanao (34)*
- 6) *Chamorro (Mariana Islands) and Palauan (Belau) (18)*
- 7) *Sangiric (Talaud and Sangir Islands and north-eastern Sulawesi) (34, 43)*
- 8) *Minahasan (north-eastern Sulawesi) (43)*
- 9) *Gorontalo-Mongondic (northern Sulawesi) (43)*
- 10) *Sama-Bajaw (Sulu Archipelago and other scattered locations in the Philippines, East Malaysia and Indonesia) (33, 34, 40, 43-45)*
- 11) *Malayo-Chamic (35-39, 41-42: Acehnese, Chamic, Malayan, Sundanese, Madurese)*
- 12) *Moken and Moklen (islands off the west coast of Thailand and Myanmar (formerly Burma)) (36)*
- 13) *North-West Borneo (41, 42: North-East Borneo, Rejang-Baram, Kayan-Kenyah groups)*

- 14) Land Dayak (inland south-west Borneo) (41)
- 15) East Barito (south-east Borneo and Madagascar) (42)
- 16) Barito-Mahakam (south-east Borneo) (42)
- 17) West Barito (southern Borneo) (42)
- 18) Lampung (south-east Sumatra) (38)
- 19) North-west Sumatra/Barrier Islands (38: *Gayo, Batak, Nias, Mentawai, Enggano*)
- 20) Java-Bali-Sasak (39-40)
- 21) Central Sulawesi (43-44)
- 22) South Sulawesi (43-44)
- 23) Muna-Buton (islands off south-east Sulawesi) (44)
- 24) Tamanic (central Borneo) (41: *Mbaloh*)

The first five groups were discussed above. Zorc (1978) combines the Batanic subgroup (which includes Yami) and the Northern Philippine subgroup (including Isneg and Limos Kalinga) shown by McFarland in Wurm – Hattori (1983). The *Meso-Philippines* group is equivalent to Zorc's (1978) Central and Meso-Philippine groups and includes Tagalog, Aklanon Bisayan, Palawan and Molbog. The *Southern Philippines* group includes Kawayan Manobo, the *South Mindanao* group Sarangani Blaan. The most thorough comparative work on a Philippines group is Zorc's (1977) study of the (Meso-Philippine) Bisayan dialects. More piecemeal comparative work has also been published for the Meso-Philippine East Mindanao subgroup (Gallman 1979, Pallesen 1985: 125-156, 289-297) and for subgroups within the Southern Philippine group (Elkins 1973-74, 1983-84, Allison 1979, Harmon 1979, Fleischmann 1981).

The languages of Groups 6-10 have generally been associated by scholars with languages of the Philippines (hence Gorontalo, group 9, is included with the Southern Philippines languages in Figure 3). However, this association is based on the shared retention of PMP morphosyntactic features rather than on shared innovation, and these are not grounds for subgrouping.

*Chamorro* and *Palauan* are combined in Group 6 because both belong geographically to Micronesia, and are situated to the east of the Philippines. However, they share no known innovations, and little can be said about their genealogy other than that they are clearly Malayo-Polynesian but do not belong to the Central/Eastern Malayo-Polynesian group (i.e. they are "Western Malayo-Polynesian"). Starosta and Pagotto (1991) have suggested on syntactic grounds that Chamorro's closest relatives could be either in Taiwan or the Philippines. However, both Chamorro and Palauan reflect the second politeness shift and verbal derivation with *\*maŋ-*: they are therefore Malayo-Polynesian, and their closest relatives cannot be on Taiwan. The

difficulty in assigning these two languages to a subgroup or subgroups of Malayo-Polynesian lies in our ignorance of many western Malayo-Polynesian languages: good descriptions of both Chamorro (Topping 1973, 1975) and Palauan (Josephs 1975, McManus 1977, Hagège 1986) are available.

The languages of Groups 7, 8 and 9 are all located in the region which includes northern Sulawesi and the islands to its north towards Mindanao. The proto-languages of the three groups have been reconstructed and their implications for subgrouping examined, for *Sangiric* by Sneddon (1982), for *Minahasan* by Sneddon (1978) and for *Gorontalo-Mongondic* by Usup (1986) and Sneddon – Usup (1986). Group 9 is represented here by Gorontalo. Sneddon (1989) concludes that no innovations can be identified which are shared by any of the groups with each other or with any of Groups 1-4.

*Sama Bajaw* (Group 10) is a collection of dialects spoken by “sea nomads” who live in a symbiotic relationship with various more powerful land-based groups scattered across the central and southern Philippines (and especially locations in the Sulu Archipelago, from which the Balangingi Sama word list is drawn), Sabah, Sulawesi and the Moluccas (Pallesen 1985, Verheijen 1986: 29-30). Proto-Sama-Bajaw has been reconstructed by Pallesen, who believes that it has its affiliations in Indonesia (1985: 245-246), but work to show where has yet to be done.

Group 11, the *Malayo-Chamic* group, covers substantial areas of western Indonesia and West Malaysia. It is represented by word lists from Aceh, Minangkabau, Indonesian, Sundanese, and Madurese (the geographic “Sundic” group of Figure 3 includes languages from Groups 19 and 20, as well as Group 11). The Malayo-Chamic group is proposed by Blust (1981a, 1985), but needs further work for its definition in terms of shared innovations. Within the group, two major subgroups can be distinguished, Malayic and Aceh-Chamic.

The internal subgrouping of *Malayic* is not yet fully understood, but it includes the subgroup which Wurm (in Wurm – Hattori 1983) has labelled “Malayan” (centred on the Malay Peninsula, east Sumatra, and southern Borneo), and possibly Sundanese (west Java) and Madurese (Madura Island, off east Java). However, the Malayic subgroup is not without controversy. Nothofer (1988) proposes on the basis of lexical innovations that Tamanic (his “Maloh”, our Group 24) also belongs to it, but that it excludes Madurese.<sup>30</sup>

Adelaar (1985) provides a well founded reconstruction of the proto-language of “Malayan”, somewhat confusingly named “Proto-Malayic”. He

argues that this proto-language was probably spoken somewhere in western Borneo, in the region where today's Malayic Dayak languages are spoken (Adelaar 1988, forthcoming). According to Blust (1988b), by about two thousand years ago "Malayan" speakers had also established themselves on both coasts of the Strait of Malacca (on the Malay Peninsula and in the south-eastern half of Sumatra), and from about a thousand years ago settled various enclaves in central and eastern Indonesia, giving rise to such varieties as Ambonese Malay, Bacan Malay and Menado Malay.

The integrity of the *Aceh-Chamic* group has been demonstrated by Cowan (1948, 1974, 1988) and Durie (1989). The Chamic languages are spoken in inland relic areas in southern Vietnam and Kampuchea (and one language on the Chinese island of Hainan), and are surrounded by languages of the Austro-Asiatic Mon-Khmer family which have apparently reduced what was once a much larger Austronesian speaking territory. Aceh of north-west Sumatra represents a colony established from this mainland region and, like the Chamic languages, has undergone changes resulting from contact with Mon-Khmer languages.

Group 12 consists of the dialects of the *Moken* and *Moklen* "sea gypsies" along the coast of the Andaman Sea. Reid (pers. comm.) suggests that this language is probably a member of the Aceh-Chamic group, as it also has Mon-Khmer phonology: it is basically monosyllabic, with a "pre-syllable", whereby full vowel contrasts occur only in the full syllable, not in the pre-syllable. Moken/Moklen has often been confused with Urak Lawoi', the language of the sea gypsies of the islands to their south (Hogan 1988: 1-2). The latter, however, is a "Malayan" dialect belonging to Group 11.

The geographic "Borneo" group in Figure 3 includes the area of Groups 13-17 and 24 in the present classification.

The unity of Group 13, *North-West Borneo*, all of whose members are situated on the island of Borneo, is argued on the basis of shared innovations by Blust (1974b, 1985, pers. comm.). However, Adelaar (pers. comm.) suggests that Rejang-Baram may belong with Group 14. Group 13 is represented here by Timugon Murut.

The genealogy of the *Land Dayak* languages of south-west Borneo (Group 14) remains unknown, but Adelaar (1991) gives evidence that, like the Aceh-Chamic languages and Moken/Moklen, these languages show signs of contact with Mon-Khmer languages: they may be the result of language shift by a group of the Mon-Khmer speakers related to those of the Malay Peninsula.

Groups 15, 16 and 17 were combined by Hudson (1967) into the *Barito* group. However, in his 1978 paper they are split into three without

explanation, and there are no known grounds for combining them. Dahl (1977) reviews the phonological evidence for Hudson's groupings and largely agrees with them, but offers no qualitative evidence for the larger Barito grouping. East Barito (Group 15) is well known for the fact that one of its members is Malagasy, the language (or group of languages) spoken on Madagascar, as Dahl (1951) has shown. Until recently, it has been accepted that Barito speakers arrived on Madagascar by the fourth or fifth century A.D., but recent work by Adelaar (1989) on Malay loan words in Malagasy indicates that the migration must have occurred between the fifth and the thirteenth centuries, with the seventh century A.D. as the most probable period. No detail is available with regard to the genetic affiliations of Groups 15-17, nor of Group 18.

Group 18 contains only *Lampung*, of extreme south-east Sumatra. Although it has been suggested in the past that it belongs to the Malayic group, current opinion regards it as not yet classified (Blust, pers. comm., Nothofer 1988). Comparative dialect material and a short grammar of one dialect have been published by Walker (1975, 1976).

Although the languages of *north-west Sumatra* and *the Barrier Islands* off Sumatra's south-west coast (Group 19) appear superficially quite diverse, there is comparative evidence that they form a single genetic group. Adelaar (1981) demonstrated the unity of the Batak languages and reconstructed Proto-Batak, and Nothofer (1986) has shown that the members of the group share a number of innovations in common. The best described language of the group is Toba Batak, for which a word list is provided here.

Group 20, the *Java-Bali-Sasak* group, was proposed by Esser (1938), but he provides no supporting evidence for it. The Bali-Sasak connection is well established, but its relationship to Javanese requires formal demonstration. It is possible that similarities between Balinese and Javanese owe more to intense contact before the sixteenth century A.D. islamicisation of Java than to shared inheritance. It has also often been assumed that Javanese is quite closely related to Malayo-Chamic, but again the similarities may well be largely due to contact. Hopefully, the inclusion here of word lists for Javanese, Balinese and Sasak will assist scholars working in this area. Linguistic study of Old Javanese and Old Balinese texts is also needed in order to reconstruct their linguistic history and the effects of contact, although it is probable that the texts are linguistically conservative in relation to the spoken languages contemporaneous with them.

Groups 21, 22 and 23 are all spoken on or near the island of Sulawesi, and are shown as a "Sulawesi" group in Figure 3. The *South Sulawesi* group is well established, as a result of Mills' (1975) work, but the integrity of the

*Central Sulawesi* and *Muna-Buton* groups is uncertain (C. Grimes, pers. comm., van den Berg 1991). The term “Muna-Buton group” is due to Esser (1938), who includes in it the *Wolio* language, for which a list is included in the present work. Relationships among the languages attributed to the three groups are unclear, although impressionistically those of the South and Central Sulawesi groups seem to be connected. The inclusion of two Central Sulawesi (Da’a, Uma) and two South Sulawesi (Bugis, Konjo) lists in the present work will improve this situation.

Interestingly, Adelaar (1991, forthcoming) has recently presented a set of innovations shared by the *Tamanic* languages of Central Borneo (Group 24) and the languages of South Sulawesi (Group 22), and proposes a genetic relationship between them.

Blust (1985 and pers. comm.) suggests that Malayo-Chamic, the three Barito groups, and Java-Bali-Sasak are all descended from a language which we may call Proto-South-East Borneo. This language separated into Proto-Barito, ancestral to the Barito groups, and a proto-language ancestral to Malayo-Chamic and Java-Bali-Sasak.

The broadest-brush approach to the subgrouping of “Western Malayo-Polynesian” languages is that taken by Nothofer (1991), who suggests that much of the western Malayo-Polynesian region was once occupied by speakers of languages belonging to a group which he dubs “Palaeo-Hesperonesian”. At a later date, much of this area was then occupied by speakers of “Hesperonesian” languages, who became culturally dominant, in western Indonesia and West Malaysia, displacing Palaeo-Hesperonesian languages, which today survive around the periphery of the Western Malayo-Polynesian region. If I interpret Nothofer correctly, the five Philippine groups (1-5), the six Sulawesi groups (7-9, 21-23), the north-west Sumatra/Barrier Islands group, and probably the North-West Borneo group would all be assigned by him to the Palaeo-Hesperonesian grouping, whilst Malayo-Chamic, the three Barito groups, and Java-Bali-Sasak (i.e. the higher-order grouping also proposed by Blust) form the Hesperonesian grouping.<sup>31</sup> Much of the evidence which Nothofer uses is lexical, and subject to the same difficulties as Zorc’s use of lexical evidence in the Philippines. Nonetheless, his proposal would do much to make sense of the chaos in western Malayo-Polynesian classification, and deserves careful investigation by the comparative method.

Reid (pers. comm.) points out that the Meso-Philippine languages and those which Nothofer groups as “Hesperonesian” exclusively share an innovation whereby the PAN ligature \*(n)a (Starosta – Pawley – Reid 1982) has become -ŋ, reflected for example in Tagalog aŋ ‘pivot common noun

phrase marker' (< \*a-ŋ noun phrase marker + ligature), Indonesian *yaŋ* 'relative clause marker', Aceh *ŋaŋ* 'relative clause marker', and the Old Javanese ligature *-ŋ*. This suggests, among other things, a possible modification to Nothofer's scenario, in that it would group the Meso-Philippine languages with his Hesperonesian. However, the split in this hypothesised group would have had to occur before PAN \*R became Proto-Meso-Philippine \*g.

The confusion which shrouds the subgrouping of western Malayo-Polynesian languages makes it difficult to reconstruct much of what happened immediately after speakers of an early Austronesian communalect migrated southward from Taiwan to the Batan Islands or to Luzon and their speech became Proto-Malayo-Polynesian. Proto-Malayo-Polynesian speakers probably spread through the Philippines, where their speech gradually diversified into a number of languages. However, the languages of the Philippines today are less diverse than we would expect, and Blust (1985) suggests that at various times in the past five thousand years what he calls "linguistic levelling" has occurred, i.e. one prehistoric language has expanded at the expense of its neighbours and/or massive contact-induced change has occurred, reducing linguistic diversity. It is perhaps this situation which has given rise to controversy over Philippine subgrouping, as scholars have attempted to separate archaic features and shared innovations from borrowings and other contact-induced changes.

There are three general routes by which speakers of Malayo-Polynesian communalects could have entered the Indo-Malaysian archipelago from the Philippines, carrying with them their rice-growing culture: through north-east Borneo, through northern Sulawesi, and through Halmahera in the northern Moluccas.

The first of these routes was certainly used, and a Malayo-Polynesian language was spoken in north-west Borneo, perhaps by 2500 B.C. when rice was already growing in the neighbourhood of the Gua Sireh archaeological site in Sarawak (Bellwood pers. comm.). The North-West Borneo group may well consist of descendants of those first Austronesian settlers, who have remained more or less *in situ*, or it may be the result of a later incursion into Borneo. Some Malayo-Polynesian speakers probably interacted with Mon-Khmer speaking hunter-gatherers, to judge from the evidence of Land Dayak. More importantly, however, they established a strong presence in the west of Borneo, where the Barito and Malayic Dayak languages are now located, and on both Blust's and Nothofer's hypotheses this area was the centre from which the languages ancestral to the Malayo-Chamic and Java-

Bali-Sasak groups originated. However, this is a speculative reconstruction which requires a great deal of both linguistic and archaeological support.

The second route was evidently also used and Malayo-Polynesian communalects entered Indonesia through northern Sulawesi. It is unlikely that all the groups in Sulawesi are descended from a single Malayo-Polynesian migration. The three northern groups (7-9) in particular may be descended from more recent incursions.

Clearly these speculations would require some adjustment to fit Nothofer's Palaeo-Hesperonesian hypothesis and/or Reid's Meso-Philippine/South-East Borneo connection. All these proposals require detailed data collection and careful comparative work for their confirmation or refutation.

It is unclear whether the third route into Indonesia, through Halmahera, was used at an early date: speakers of a Malayo-Polynesian communalect apparently entered the Moluccas between 3000 and 2500 B.C., and their speech became Proto-Central/Eastern Malayo-Polynesian (PCEMP). But whether they came from the Philippines directly to Halmahera or, as seems geographically more likely, through Sulawesi is not yet known. The speakers of PCEMP dispersed quite rapidly, one group settling probably on Halmahera, where their language evolved into Proto-Eastern-Malayo-Polynesian (PEMP), and another group occupying a location further south, where their language became Proto-Central-Malayo-Polynesian (PCMP). From here, sometime before 2000 B.C., Central Malayo-Polynesian speakers spread across the south Moluccas and the eastern part of Nusa Tenggara (the lesser Sunda Islands; see Map B).

Of all the right-hand branches in Figure 10, the Central/Eastern Malayo-Polynesian (CEMP) is the least well supported by the comparative method. The grouping was proposed by Blust (1974a) and evidence put forward in its support by Blust (1982a, 1984, 1990a).

In relation to the reconstruction of PMP phonology outlined above, PCEMP underwent no innovations in its phoneme system. However, all CEMP languages reflect a reduction of heterorganic consonant clusters arising through reduplication, except where this resulted in a nasal + stop sequence. For example, PMP *\*bukbúk* 'wood weevil' became PCEMP *\*bubuk*, but PMP *\*demdém* 'dark' became PCEMP *\*dendem*. There are also a number of irregular phonological changes which occurred in single words, although as Blust (1990a) admits, some of these may be the result of independent parallel innovation (e.g. many languages reflect *\*sei* 'who?' rather than *\*sai*). The irregular change from PMP *\*maRi* 'come' to PCEMP *\*mai*, on the other hand, is significant.

Blust (1990a) also provides a number of PCEMP lexical and semantic innovations. The most telling of these were published in Blust (1982a), where he argues that as Malayo-Polynesian speakers crossed the Wallace Line, which divides the region occupied by placental mammals from the region inhabited by marsupial mammals, they required names for the new animals they encountered. Since languages in both the Central Malayo-Polynesian and Eastern Malayo-Polynesian groups (including some in the Oceanic subgroup) reflect the etyma *\*kandoRa* ‘cuscus’ and *\*mansar* ‘bandicoot’, he argues that there must have been a PCEMP language in which these innovations occurred.

In Figures 2 and 10 the left-hand branch of CEMP is Central Malayo-Polynesian. As with the previous left-hand branch, Western Malayo-Polynesian, there is also little evidence that the Central Malayo-Polynesian languages form a closed subgroup. It is probable that PCEMP had diversified into a local linkage before PEMP separated from it, leaving the “stay-at-home” Central Malayo-Polynesian languages with no exclusively shared ancestor. Blust (1990a) describes a number of phonological and lexical innovations which seem to have originated in different parts of the early Central Malayo-Polynesian linkage and to have spread through part, but not all, of the linkage. The result is patchily distributed innovations and differences in rule ordering among languages. Thus many Central Malayo-Polynesian languages show what Blust calls “glide truncation”: the final glide of inherited *\*-ay*, *\*-aw*, or *\*-uy* is deleted, leaving *-a* or *-u* (for example, PMP *\*matáy* ‘die’ > Buru *mata*, PMP *\*pánaw* ‘walk’ > Buru *pana*, PMP *\*bábuy* ‘pig’ > Buru *fafu*).<sup>32</sup> But this innovation does not occur in all Central Malayo-Polynesian languages, nor in all eligible items in languages where it does occur. One possible innovation that Central Malayo-Polynesian languages have in common is their sharing of the pronominal subject proclitic forms *\*ku-* ‘1S’, *\*mu-* ‘2S’, *\*na-* ‘3S’, *\*ma-* ‘1EP’, *\*ta-* ‘1IP’, *\*mi-* ‘2P’, and *\*da-* ‘3P’ (Blust 1990a). However, the fact that sets of very similar proclitic forms occur in western Malayo-Polynesian and South Halmahera languages casts doubt on this as an innovation.

Recognised groupings of Central Malayo-Polynesian languages are listed here under the same conventions as were used above for Western Malayo-Polynesian (the first five are as shown in Figure 3).

- 1) Bima-Sumba (eastern part of Sumbawa, Sumba, Flores) (40)
- 2) Timor (40: *Timor and Waima’a groups*)
- 3) South-East Maluku (Tanimbar and Kai island groups) (4, 40)
- 4) Aru (4)
- 5) Central Maluku (Seram, Buru, and their offshore islands) (45)

- 6) North Bomberai (south coast of MacCluer Gulf, Irian Jaya) (2)  
 7) Koiwai (south coast of Bird's Neck, Irian Jaya) (2: *Kaiwai*)

These groups form the basis of Figure 4. I am indebted to Charles Grimes, who provided most of this classification and is the source of much of the commentary below.

Group 1, the *Bima-Sumba group* is represented in this work by word lists from Manggarai and Ngada. The Bima language on Sumbawa Island is at the interface between the Bima-Sumba group and the Western Malayo-Polynesian Sumbawa language (closely related to Sasak and Balinese). Although the Bima-Sumba group has long been recognised (by Esser 1938, who followed Jonker's work thirty years earlier), no work appears to have been done to establish its validity in terms of shared innovations.

The *Timor group* (Group 2) is represented in this work by Sikka and Roti. It matches Fox and Wurm's "Timor Area group" in Wurm – Hattori (1983) with the addition of the Waima'a languages, which appear superficially rather different from other Timor languages because of contact-induced change associated with their locations, surrounded by Papuan languages. Again, there is no published work presenting shared innovations of this group.

The *South-East Maluku group* (Group 3) is as recognised by Wurm – Hattori (1983) and by Collins (1982) but with the exclusion of the languages of the *Aru Islands*, treated here as Group 4 and represented in this work by a Dobel word list. Collins places the languages together because of their shared merger of PMP \**R*, \**r*, and \**j*, but recognises that the Aru languages are otherwise quite different from those of Tanimbar and Kai. However, this innovation occurs elsewhere in the region and is therefore not exclusively shared by these languages.

The *Central Maluku group* (Group 5) has long been recognised, as Collins (1983) shows in his survey of Central Maluku studies. Collins (1981) shows that, in terms of the reconstruction of PMP adopted here, Proto-Central Maluku merged PMP \**mb* and \**mp* as Proto-Central Maluku \**mb*, and PMP \**nd* and \**nt* as Proto-Central Maluku \**nd*. PMP \**j* became Proto-Central Maluku \**-t* word-finally. He also (1983) identifies some morphological innovations. However, in both works he remarks that this is not a large collection of innovations, and that further research is needed to determine whether these innovations are exclusively shared by the members of Group 5 or whether they define some higher-order group. In the latter case, they would cease to be grounds for recognising the Central Maluku group, although most or all of the groups which Collins has defined *within* Central Maluku would continue to stand. Collins (1982) is hesitant to group the

Teor-Kur languages (to north-west of Kai Islands) with Group 5 because they fail to undergo some of the innovations of their neighbours. However, they reflect the innovations which define Central Maluku. It is possible that Groups 3 and 5 will eventually prove to be descended from an ancestral chain.

Groups 6 and 7 are assigned by Wurm – Hattori (1981, 1983) and in Figure 5 to the South Halmahera/West New Guinea group of Eastern Malayo-Polynesian languages. However, Blust (1990a) shows that they reflect Central, rather than Eastern, Malayo-Polynesian innovations. Group 6, which he labels “*North Bomberai*” includes the Sekar, Onin, and Uruangnirin languages, and possibly Arguni, as well perhaps as other nearby Austronesian languages for which no data are available. Blust also argues for a subgrouping relationship between the North Bomberai group and Yamdena, here assigned to the South-East Maluku group, and suggests that Groups 3, 4, and 6 (and perhaps other languages too) will eventually prove to form a higher-order grouping.

Group 7 consists of a single language, *Koiwai*, spoken by an Islamicised group in the south coast of Irian Jaya.

The comparative method has as yet been little applied to questions of subgrouping within the Central Malayo-Polynesian branch. This is an area in which there is enormous scope for research.

The right-hand branch of the PCEMP node in Figure 10 is occupied by PEMP. It is again one of Blust’s papers (1978) which is the source of this subgrouping hypothesis. Evidence for the Eastern Malayo-Polynesian grouping consists essentially of putative lexical innovations (Blust gives 56), but some of these may be exclusively shared inherited features. There are no convincing phonological innovations shared in common by the two member groups, South Halmahera/West New Guinea (SHWNG) and Oceanic (see Maps A and B).

PEMP in its turn gave rise to two languages, Proto-SHWNG and Proto-Oceanic (POC).

Proto-SHWNG is one of the few cases in Figure 10 where we find at the left-hand branch a single proto-language, as opposed to a group of “stay-at-homes” who have no exclusively shared ancestor. Because the unity of Proto-SHWNG is remarkable, it is worth summarising its phonological innovations here, relative to the PMP phonology reconstructed above. They are:<sup>33</sup>

- a) PMP \**p* became Proto-SHWNG \**f*
- b) PMP penultimate \**e* became Proto-SHWNG \**o*

- c) PMP initial *\*a-* became Proto-SHWNG *\*ya-*
- d) PMP *\*t* became Proto-SHWNG *\*s* before *\*j*
- e) PMP *\*-j-* merged with *\*s* as Proto-SHWNG *\*-s-*
- f) PMP *\*k, \*q, \*h, \*H* and *\*ʔ* were lost
- g) PMP *\*d, \*Z, \*l* and *\*r* merged as Proto-SHWNG *\*l*
- h) PMP *\*n* and *\*ñ* merged as Proto-SHWNG *\*n*
- i) PMP final syllable *\*e* merged with final syllable *\*a* as Proto-SHWNG *\*ə*

Although some of these innovations (a, c, d, f, h) occur with sufficient frequency in Austronesian languages for us to infer that they could have occurred independently after the break-up of Proto-SHWNG, others (b, g, i) are quite striking and their occurrence in combination proves the integrity of Proto-SHWNG as a language. Blust (1978) also demonstrates the integrity of each of the two SHWNG subgroups, and my unpublished research bears this out: Proto-SHWNG split into Proto-South-Halmahera and Proto-West-New-Guinea. The South Halmahera group is represented in this work by Sawai and Irarutu.

The fact that PEMP split into two discrete proto-languages and did not give rise to a collection of “stay-at-homes” casts some light on why it is defined by no exclusively shared innovations outside the lexicon. It indicates that PEMP did not diversify into a linkage of dialects before it split, but either spent a relatively short period as a discrete language or spent its time as a discrete language in a small and remote location where the possibility of dialect differentiation was very limited. Positing the smallest number of migratory moves, this location was either Halmahera or the Cenderawasih Bay area, to the east of the Bird’s Head of Irian Jaya — more probably the former, on the principle that the location of the more conservative members of a language group is likely to be its homeland (Ross 1991c). Either Halmahera or the Cenderawasih Bay qualifies as an isolated location. It was probably from here sometime around 2000 B.C. that speakers of the immediate ancestor of POC made their way via the offshore islands of the north coast of Irian Jaya and mainland Papua New Guinea to a new homeland in the Bismarck Archipelago. The people they left behind them spoke a virtually undifferentiated form of PEMP, which underwent a series of phonological innovations to become Proto-SHWNG before some of its speakers moved from Halmahera to the coast and islands of Cenderawasih Bay or vice versa.

In his attempt to delineate the Irian Jaya boundary between Central and Eastern Malayo-Polynesian languages, Blust (1990a) has questioned whether Irarutu, one of the languages for which a word list appears in this work and

which has previously been attributed to the SHWNG group, belongs to SHWNG or to Central Malayo-Polynesian. Since the latter is ill-defined, realistically we can only ask: is Irarutu a SHWNG language? The answer appears to be that it is. Because Irarutu has undergone extensive lexical replacement, probably through contact with a neighbouring Papuan language or languages, it is often difficult to find relevant examples. However, there is evidence of the SHWNG innovations (a), (b), (f) and (g) as follows:

- a) PMP \**penúq* ‘full’ > Irarutu *nə-φonə*  
PMP \**páqa* ‘thigh’ > Irarutu *fa* ‘leg’
- b) PMP \**telú* ‘three’ > Irarutu *torə*  
PMP \**deŋéR* ‘hear’ > Irarutu *nafa-roŋ-kərə* (and \**penuq* above)
- f) PMP \**káyuh* ‘tree’ > Irarutu *ε*  
PMP \**kútuh* ‘louse’ > Irarutu *utə*  
PMP \**panákaw* ‘steal’ > Irarutu *mbana*  
PMP \**iakú* ‘I’ > Irarutu *ǰa*  
PMP \**qatéluR* ‘egg’ > Irarutu *təru* (and \**páqa* above)
- g) PMP \**dáhun* ‘leaf’ > Irarutu *rə*  
PMP \**sidá* ‘they’ > Irarutu *irə* (and \**deŋeR* above)  
PMP \**Zálan* ‘path’ > Irarutu *randəni*  
PMP \**lágit* ‘sky’ > Irarutu *ragətə*  
PEMP \**bitəl* ‘hungry’ > Irarutu *mbitərə* (and \**qatéluR* above)

Although these groupings are well established on the basis of the available data, there remain languages in Halmahera for which the only published information is that contained in the Holle lists (Stokhof (ed.) with Saleh-Bronckhorst 1980), lists collected by Dutch amateurs (mainly colonial officials), and languages around the Bird’s Head and Cenderawasih Bay area of Irian Jaya for which we have no data at all.

Although the Oceanic subgroup of Austronesian languages covers a larger area than any of the other major groups, its integrity is quite clear and its internal subgrouping reasonably well understood. Table 6 sets out the correspondences between the reconstructed PMP and POC phoneme systems. The POC symbols have their expected values, except that voiced stops were prenasalised. The development of the POC consonant system is analysed in some detail in Ross (1988, chapter 3). The table also shows the equivalences between the POC orthography used here (from Ross 1988) and that used by Grace (1969) and other scholars.<sup>34</sup>

*Table 6.* Correspondences between the reconstructed phoneme systems of Proto-Malayo-Polynesian and Proto-Oceanic

PMP		p, b	t	d, r	s, Z	j	k, g			
POC	oral	p	p <sup>w</sup>	t	r	s	c	k		
	nasal	b	b <sup>w</sup>	d	dr	j	j	g		
Grace	oral	p	...	t	d	s	j	k		
	nasal	mp	ŋp	nt	nd	nj	nj	ŋk		
PMP		m	n	n̄	ŋ	w	y	l	q	h, H, ? R
POC	m	m <sup>w</sup>	n	n̄	ŋ	w	y	l	q	∅ R
Grace	m	ŋm	n	n̄	ŋ	w	y	l	q	∅ R
PMP	i, -uy	e, -aw	-ay	a	u					
POC	i	o	e	a	u					

The innovations which occurred in POC were a set of mergers and splits. The PMP consonant pairs *\*p*/*\*b*, *\*d*/*\*r*, *\*s*/*\*Z* and *\*k*/*\*g* each merged in POC. However, where a PMP obstruent was preceded by a nasal in the language immediately ancestral to POC, a unitary prenasalised voiced consonant resulted. Thus, for example, PMP *\*k* and *\*g* merged as POC *\*k* [k], but earlier *\*ŋk* and *\*ŋg* merged as POC *\*g* [<sup>0</sup>g]; POC *\*k* is known as an oral grade obstruent, whilst *\*g* is its nasal grade equivalent. I write “earlier” rather than “PMP” because PMP probably had no word-initial nasal + stop sequences, whereas the immediate ancestor of POC certainly did. For example, PMP *\*kúden* ‘cooking pot’ became POC *\*kuron*, but PMP *\*kabut* ‘mist’ became POC *\*gabu(t)*, evidently via a Pre-POC form *\*ŋkabu(t)*. In the case of the PMP bilabials an additional complication intervened, as they split into plain and labialised bilabials. PMP *\*e* became POC *\*o*, and the PMP word-final diphthongs merged with plain vowels.

It is very probable that there were morphosyntactic innovations in POC. However, although we can claim to understand POC morphosyntax in some measure (Pawley 1973, Pawley – Reid 1980, Lichtenberk 1985a, 1985b,

Crowley 1985, Ross 1988, chapter 4), we do not know enough about PEMP grammar to reconstruct the innovations of POC with reasonable certainty. There were also numerous lexical innovations in POC, but no list of these has ever been compiled. For example, PMP \**limaw* 'citrus fruit' was replaced by POC \**molis*.

It seems unlikely (but not impossible) that the immediate ancestors of POC speakers should have migrated from Halmahera or the Bird's Head directly to somewhere in the Bismarck Archipelago, and there is no need to posit a single direct migration. There is linguistic evidence that Pre-POC speakers were in contact with Papuan speakers on the coast and offshore islands of the Madang area of Papua New Guinea's north coast, perhaps *en route* to the Bismarcks (Ross 1988: 21), and the contiguity of several Oceanic subgroups in the Bismarck Archipelago makes it the most likely location for POC. I have argued elsewhere that the north of New Britain, around the Willaumez Peninsula, is linguistically a probable POC homeland (Ross 1989a). It is generally accepted by scholars that there is an association between the spread of Oceanic languages and the dispersal of Lapita pottery and associated artefacts from western Melanesia into the central Pacific (Shutler – Marck 1975, Spriggs 1984, Pawley – Green 1984), and this gives a clue as to why Pre-POC speakers might have settled at a New Britain location. One of the more important materials in Lapita culture was obsidian (volcanic glass), used to make cutting tools, and the Willaumez Peninsula with its string of volcanoes provides one of the most important sources of obsidian in the Indo-Pacific region: it was traded widely by Lapita potters — our putative Oceanic speakers — into the Pacific, and has also been found as far west as Borneo (Bellwood 1989). The association between POC and the Lapita bearers also helps us to date POC: Lapita pottery appeared in the Bismarck Archipelago sometime between 1900 and 1500 B.C. (Spriggs 1990).

POC speakers must have remained together long enough for the innovations listed above to have occurred in their speech. However, this need not have been more than a century or two. Linguistic and archaeological evidence indicates that from about 1250 B.C. Oceanic speakers spread rapidly across most of island Melanesia and into western Polynesia and Micronesia (Spriggs 1990). POC is shown in Figure 10 as dividing into three branches: Proto-Admiralty, Western Oceanic languages, and Proto-Central/Eastern-Oceanic. However, this division is a controversial simplification, to which we return below.

Again it is useful to put together a listing of groups as a basis for discussion:

- 1) Admiralty Islands (14)
- 2) St Matthias Islands (14)
- 3) Western Oceanic (Papua New Guinea and the western Solomon Islands) (6-10, 13-15)
- 4) Sarmi/Jayapura Bay (Irian Jaya) (3: *Yotafa-Sarmi group*)
- 5) Southeast Solomonian (15: *Gela-Guadalcanal and Malaita-San Cristobal groups*)
- 6) Utupua and Vanikoro (Te Motu Province, Solomon Islands) (15)
- 7) North/Central Vanuatu (16: *North and Central New Hebrides, East Santo, and Malekula Interior groups*)
- 8) South Vanuatu (16: *Erromanga, Tanna and Aneityum groups*)
- 9) Southern Oceanic (New Caledonia and the Loyalty Islands) (17)
- 10) Nuclear Micronesian (18)
- 11) Central Pacific (Rotuma, Fiji, Polynesia, New Zealand) (19)
- 12) Yapese (18)

Groups 1 and 2, the *Admiralties family* and the *St Matthias group*, are each clearly defined by a set of innovations, and Proto-Admiralty has been reconstructed (Blust 1978, Ross 1988: chapter 9). The St Matthias group may yet prove to be specifically associated with the Admiralties family; it is not closely relative to its southern neighbours on New Ireland. The Admiralties family is represented here by a word list from Nyindrou.

The *Western Oceanic* grouping, Group 3, was proposed by Ross (1988: 386-389). Because so little lexical material has been published for these 220 or so languages, they are represented here by fifteen word lists. With a few exceptions, POC *\*r* and *\*R* have merged in these languages, and they share reflexes of the innovative disjunctive pronoun *\*idri[a]* 'they' (instead of POC *\*(k)ira*). Western Oceanic languages also sporadically reflect other features which imply that the languages of the region are descended from a dialect linkage with a history separate from that of other Oceanic groups. Its internal structure is discussed below.

Two groups of Oceanic languages have been recognised in Irian Jaya (Group 4), the Jayapura Bay and Sarmi Coast groups. The latter was the subject of a preliminary investigation by Grace (1971) and I have analysed the skimpy material for the other, the Jayapura Bay group.<sup>35</sup> It is sufficient to indicate that the two form a single higher-order *Sarmi/Jayapura Bay group*. Grounds for this grouping are (a) that POC *\*r*, *\*R* and *\*l* are merged in all member languages, and (b) that all member languages have a voiceless reflex of POC *\*b*.

Group 5, the *Southeast Solomonian* family is well defined by innovations and has been the subject of several pieces of reconstruction (Pawley 1972, Levy 1979, 1980, Tryon – Hackman 1983, Lichtenberk 1988). Its apparent conservatism makes it valuable for Oceanic comparative studies, and two word lists from the family are given in this work: Lau and Kwaio.

The languages of the tiny islands of *Utupua* and *Vanikoro* (Group 6) have been documented by Tryon – Hackman (1983), but have yet to be linked directly to any other group. Their speakers share their island group with speakers of the easternmost Papuan languages.

The languages of Group 7, *North/Central Vanuatu*, show innovations none of which is shared by all members of the group. Documented by Pawley (1972), Tryon (1976) and Clark (1985), the last-named describes the group as the outcome of a dialect linkage which has gradually differentiated out into local languages. He places an important boundary between North and Central Vanuatu, “with the boundary running between Santo and Malekula and between Raga and the remainder of Pentecost” (1985: 221). North/Central Vanuatu languages for which word lists appear in this work are Raga, Paama, Lewo and Port Sandwich.

The languages of the *South Vanuatu* group (Group 8) are spoken on the islands of Erromanga, Tanna and Aneityum, and extensive reconstruction of Proto-South Vanuatu and of interstage proto-languages has been done by Lynch (1978, 1983, 1986, 1990). They are represented here by North Tanna and Kwamera word lists. Clark (1985: 219-220) has also presented innovations shared by some languages in Groups 7 and 8, suggesting their descent from an ancestral linkage.

Group 9, the *Southern Oceanic* group includes all the languages of New Caledonia and the Loyalty Islands: its shared innovations were noted by Geraghty (1989). Representative word lists in this volume are provided for Nemi, Cèmuhi, A’jië, and Xârâcùù, on New Caledonia, and for the Loyalty Islands language Nengone. Geraghty also suggests that Groups 8 and 9 form a larger group, and implies that 9-10 may form a yet larger linkage. These hypotheses are circumstantially reasonable, but need more research.

The *Nuclear Micronesian* group (Group 10) covers all of Micronesia except Belau and part of the Marianas (see Western Malayo-Polynesian Group 5 above), and probably Yap. Group 10 is documented by Bender (1971) and Bender – Wang (1985), and Proto-Micronesian reconstruction has been done by Jackson (1983), who also provides a set of shared innovations. Although long considered an isolate, it is now considered that Nauruan probably also belongs to this group (Nathan 1973). It is represented

in the present work by word lists from Kiribati, Marshallese, Ponapean and Woleaian.

The integrity of the *Central Pacific* linkage (Group 11), covering a vast area of the Pacific, has long been recognised (Grace 1959, Pawley 1972), and its shared innovations and history (to be discussed below) have been reconstructed by Geraghty (1983, 1986, 1989).<sup>36</sup> Its representatives among the word lists here are Rotuman, West Fijian, East Fijian and, from the Polynesian subgroup of Central Pacific, Tongan, Samoan, Mele-Fila, Tahitian and Rapanui.

Group 12 consists of only one language, *Yapese*, which is also located on a Micronesian Island. Scholarly opinion is that it is not a member of the Nuclear Micronesian group, but is an Oceanic language whose exact position in the Oceanic group requires investigation.

The Oceanic group is perhaps the best understood of all the major groups in the Austronesian family in terms of the comparative method, and its areas of controversy are perhaps rather insignificant in comparison with those of other parts of the family.<sup>37</sup> Probably most Oceanic linguists now agree with Pawley's (1981) view that Oceania was settled quite rapidly from a POC homeland in the Bismarck Archipelago. The first Lapita assemblages in several regions of Remote Oceania (i.e. Oceania east of the Solomons) are all at around 1100-1000 B.C. (Spriggs 1990). The area of potential controversy among linguists concerns the details of the settlement process, and whether, because of the speed of settlement, we should regard Melanesia (the area bounded by Papua New Guinea, New Caledonia, and Fiji) as one great linkage (as Pawley 1981 suggests), within which only fairly localised groups of languages, each descended from a local interstage language, are recognisable, or whether, as we have done in Figure 10, we can treat the languages of the region as a set of subgroups from Proto-Oceanic to Proto-Central Pacific.

The truth doubtless lies somewhere between these two extremes. Linguistically, the integrity of the Admiralty Islands group is not in doubt, and the islands were almost certainly settled from the POC homeland at an early date (assuming that it was not the homeland: this possibility is remote, but not to be excluded). At about the same time, there was an eastward migration or migrations into the region represented in Figure 10 by the "Proto-Central/Eastern Oceanic" node, leaving behind in the Bismarck Archipelago speakers of dialects ancestral to the Western Oceanic languages. Although the dispersal of the latter was probably rather slower than the dispersal of Austronesian speakers into Remote Oceania, it is convenient to discuss the Western Oceanic languages first.

Although there are innovations which have affected most Western Oceanic languages, the fact that not all are affected suggests that this is another “stay-at-home” group, descended perhaps from a geographically fairly small linkage, which spread out rather more slowly than its departed sisters. The reasons for this tardiness are almost certainly associated with the fact that the mainland and at least the larger islands of Papua New Guinea had long been occupied by Papuan speakers, and in most areas of the mainland, Austronesian speakers have gained little more than a toehold on the coast.

Western Oceanic speakers spread first in two directions, to the east and to the west of the Willaumez Peninsula. To the east, they settled the north coast of New Britain coast and the islands of New Ireland (apparently from south to north), Bougainville, Choiseul, New Georgia, Santa Ysabel and their outliers to form the *Meso-Melanesian cluster*. Details of this dispersion are given by Ross (1988). The Meso-Melanesian languages share a set of innovations, setting them apart from the offshoots of Western Oceanic described in the next paragraph. It is probable either that Meso-Melanesian speakers encroached on territory already occupied by “Central/Eastern Oceanic” speakers or vice versa, as there is a sharp line dividing the Meso-Melanesian and South-East Solomonic groups from each other in the middle of the Solomons. The Meso-Melanesian cluster is represented here by word lists from Tolai, Roviana and Maringe.

To the west, Western Oceanic speakers settled the New Britain coast, and occupied islands in the Vitiaz Strait and close to the New Guinea mainland around the Huon Peninsula. Some speakers found their way into south-east Papua, forming the *Papuan Tip cluster*, whilst others later migrated along the north coast of Papua New Guinea, their dialects forming the *North New Guinea cluster*. The separate shared history of the two clusters is reflected in some exclusively shared lexical innovations. The migration to south-east Papua seems to have entailed initially a single settlement rather than a diffusion into the region, as the Papuan-Tip cluster is defined by a set of shared innovations and Proto-Papuan-Tip is readily reconstructible (Ross 1988, chapter 6). After settlement in the south-east Papuan region, speakers of a Papuan Tip language moved westwards along the south coast of Papua. This last movement can be correlated with the appearance of a pottery-bearing culture in the Central Province around 2000 years ago (Vanderwal 1973, Allen 1977a, 1977b, Bulmer 1982).

The North New Guinea cluster is characterised by the overlapping pattern of innovations which defines a linkage, but by no innovation defining the whole group (Ross 1988: 120). It is probably the outcome of a “stay-at-home” linkage which has diffused in fits and starts westward along the north

coast of Papua New Guinea, into the Huon Gulf, and around the south coast of New Britain. Circumstantially, at least, it is likely that the languages of the Sarmi/Jayapura Bay group are an extension of the north coast limb of the New Guinea cluster, and the limited evidence available tends to confirm this.<sup>38</sup> The earliest archaeological dates which can be confidently associated with North New Guinea speakers (on the New Britain coast west of the Willaumez Peninsula, and on the islands and the mainland coast of the Vitiaz Strait) are only about 1500 years ago (Lilley 1988, 1990).

Eight word lists are provided here from the North New Guinea cluster — Manam, Takia, Dami, Mangap-Mbula, Yabem, Kaulong, Buang and Adzera — and four from the Papuan Tip cluster — Kilivila, Tawala, Motu and Mekeo.

The eastward migration(s) into the Pacific shown in Figure 10 as the third branch of Proto-Oceanic are there labelled “Proto-Central/Eastern-Oceanic”. However, neither this nor the next right-hand branch, “Proto-Remote Oceanic”, has been satisfactorily defined in terms of shared innovations (although the next, Proto-Central-Pacific, has the characteristics of a linkage). The Central/Eastern Oceanic grouping, consisting of Groups 5-11, was proposed by Tryon – Lynch (1983) and is based on shared morphological innovations. However, reconstruction of POC morphology is as yet insufficient to be certain that these are innovations, rather than shared inheritances (Ross 1988: 393). Various other attempts have been made to define a large Oceanic subgroup in Eastern Oceania. In the published version of their paper, Tryon – Lynch (1985) exclude Southern Oceanic because the evidence for its inclusion seemed weak. Pawley’s (1972) “Eastern Oceanic” included Groups 5, 7, 10 and 11, but for similar reasons was later withdrawn in favour of a “Remote Oceanic” which excluded South-East Solomonic (1977). This leaves us uncertain about the right branch(es) of Figure 10 between POC and Proto-Central-Pacific.

The question which underlies these subgrouping attempts is whether eastern Oceania was settled by a straightforward series of eastward movements of Oceanic speakers (which somewhere in Vanuatu would presumably have forked into Southern Oceanic and Central Pacific) or whether there was a more complex pattern of settlement involving multiple migrations (and perhaps back migrations) in various areas.

The definition of such a large subgroup in eastern Oceania cannot avoid evaluation of one innovation: loss of POC \*R. Geraghty (1990) re-examines this loss and suggests a widespread pattern, namely that across much of the region which he labels “Eastern Oceanic” (coterminous with groups 5 to 11), POC \*R is lost in a growing number of words, the further one moves

away from western Melanesia. If it could be shown that there is an implicational relationship whereby any word in which \**R* is lost at a given distance from western Melanesia is reflected without it in all more distant languages, then there would be grounds to posit a single, gradual movement of Oceanic speakers into the Pacific. However, this is not the hypothesis that Geraghty investigates, and since POC \**R* was evidently an unstable phoneme (probably a uvular trill), the possibility that its loss represents a series of independent parallel innovations is strong. It seems likely that growth in our understanding of larger-scale settlement patterns in eastern Oceania will depend on a number of pieces of detailed, localised research.

The presentation of the Central Pacific group in Figure 8 includes an interesting feature, namely that West Fijian and East Fijian, which many would assume to be variants of a single language, are not shown as each other's closest relatives. Rather, there is some evidence indicating that West Fijian is closer to Rotuman and East Fijian to the Polynesian languages. How has this arisen? Proto-Central-Pacific evidently was spoken in the Fijian islands from their settlement in 1200 B.C., where it diversified into a dialect linkage. This linkage became separated into two sections, a western and an eastern. Geraghty (1983) has labelled the eastern linkage "Proto-Tokalau-Fijian". Speakers of a western dialect reached Rotuma, and their speech became the ancestor of Rotuman (Pawley 1979). Speakers of a Tokalau-Fijian dialect found their way to one of the island groups east or north-east of Fiji sometime around 1000 B.C., where their language evolved into Proto-Polynesian (Geraghty 1983).<sup>39</sup> Since these departures, the stay-at-home western and Tokalau-Fijian linkages have through contact been resynthesised into the Fijian dialect network, within which western and eastern sections remain identifiable. Proto-Polynesian diversified into the languages of the Polynesian family. A final twist to this tale is that Polynesian speakers at least twice also settled on Rotuma, so that modern Rotuman has a very large Polynesian contribution to its lexicon (Biggs 1965).

Although they cover an enormous area, the Polynesian languages are linguistically one of the most coherent groups in Oceania, characterised by a clear set of phonological, morphosyntactic and lexical innovations. The languages are well documented and there is a fairly clearly defined internal subgrouping (Clark 1979). Extensive reconstruction has been carried out of Proto-Polynesian phonology (Dempwolff 1934, Elbert 1953, Biggs 1978), morphosyntax (Pawley 1966, 1967, 1970, Clark 1976, Wilson 1982), syntax (Hohepa 1969, Clark 1973, 1976, Chung 1978) and lexicon (Biggs – Walsh – Waqa 1970, Biggs 1979, n.d.).

### External relationships of the Austronesian family

Over the years a number of proposals about the external relationships of the Austronesian languages — that is, about the closest relatives of PAN — have been made. The four most plausible proposals have to do, not unexpectedly, with the east Asian region. They are:

- a) the Japanese-Austronesian hypothesis, connecting Japanese with Austronesian;
- b) the Austro-Tai hypothesis, connecting Tai-Kadai and other languages of south China with Austronesian;
- c) the Sino-Austronesian hypothesis, connecting Old Chinese with Austronesian;
- d) the Austric hypothesis, connecting the Austro-Asiatic family with Austronesian.

In the case of Japanese, it is now generally accepted that putative Austronesian elements (if indeed they *are* Austronesian) are the results of borrowing or of a substratum left over after language shift rather than of genetic relationship, since neither sound correspondences nor shared grammatical morphemes have been found (Shibatani 1990: 103-109).

Before we turn to the other three proposals, it will be instructive to examine some internal Austronesian evidence about the origins of PAN. As we have seen, a large majority of reconstructed PAN items are disyllabic, with the form CVCV(C). Brandstetter (1906, 1916) drew attention to the fact that items with related meanings often share the same final syllable or “root”, a matter which Blust (1988a) followed up in considerable detail (the term “root” is used in this section for the monosyllabic root, rather than as in the previous section for the PAN mono-, di- or trisyllable). For example, the root *\*pit* ‘press, squeeze together; narrow’ is shared by PAN *\*ke(m)pit* ‘hold together, clamp’, *\*Sa(m)pit* ‘hold together’, PMP *\*ga(m)pit* ‘hold together’, *\*qi(m)pit* ‘jammed, wedged close together’, *\*le(m)pit* ‘fold’, *\*li(m)pit* ‘press between two flat surfaces’, *\*sipit* ‘squeeze, pinch, narrow’, and a number of other forms, including the reduplicated *\*pitpit* ‘pinch’ (Blust 1988a: 140-141). As Blust shows, the initial syllables of such items (in our example, *\*ke-*, *\*Sa-*, *\*ga-*, *\*qi-*, *\*le-*, *\*li-*, and *\*si-*) also constitute an open class (1988a: 34-35). Since both elements in the many segmentable disyllabic reconstructions thus represent open classes, it is reasonable to suggest that these items may result from the compounding of monosyllabic roots, probably at some pre-PAN stage. But Blust points out that if this were so, we would also expect to be able to reconstruct the meanings of the initial

elements, and this he has been unable to do (1988a: 53). Work building on Blust's, however, suggests that some initial elements may be prefixes (Zorc 1990: 182) whilst others do have reconstructible meanings (Nothofer 1990). If this proves to be more widely the case, then the compounding hypothesis will be better supported than it is at present.

If PAN should prove to contain a large number of disyllabic items derived by the compounding of monosyllables, then an inference can be made about the typology of Pre-PAN, namely that it was monosyllabic and tonal. When a language with mainly monosyllabic roots forms a large number of disyllabic compounds which are then fossilised into new single-morpheme items, this usually happens because the language at its monosyllabic stage was tonal, and loss of tone is resulting in homophones. Compounds are then formed to compensate for homophony, and these compounds finally become unsegmentable items, as perhaps in PAN. The inference that pre-PAN may have been a mainly monosyllabic tone language is not particularly surprising, since such languages (belonging to several language families) occupy much of the region comprising China and mainland south-east Asia. It must be admitted, however, that we do not know when or where the monosyllabic tonal type originated in this region.

The proposal that PAN and the Tai-Kadai family are genetically related was initially made by Benedict (1942). The Tai-Kadai languages are scattered across southern China and cut a swathe down the centre of Indo-China, their best known member being Thai ("Tai" is used for the group of languages to which Thai belongs). In later papers, re-published together as Benedict (1975), he included the Ong-Be language and the Kam-Sui and Miao-Yao language groups in this macro-group, and named it "Austro-Thai", today usually spelled "Austro-Tai".<sup>40</sup> The languages of these groups and the Tai-Kadai languages are generally monosyllabic tone languages, and Benedict set out to show that monosyllabic roots in Tai-Kadai languages show sound correspondences with the stressed syllable of reconstructed PAN items. Benedict's hypothesis has received little support from Austronesianists, largely because his methods of establishing sound correspondences have been considered too loose. However, Reid (1985) has extended and re-evaluated Benedict's data base and suggests "that the similarities we find are of such kinds and in such quantities that they are highly unlikely to be accidental, and probably point to a genetic relationship". An important direction for future research is the systematic reconstruction of the proto-language or languages of the non-Austronesian members of the putative Austro-Tai grouping, so that comparisons can be

made with a thoroughness similar to that involved in the reconstruction of PAN.

A proposal that Old Chinese is a close relative of PAN has been put forward by Sagart (1990), who lists sound correspondences between PAN roots and Old Chinese monosyllables (a form of Chinese spoken around 1000 B.C) and derives both from an earlier Proto-Sino-Austronesian (PSAN). The following are typical comparisons:

PAN		Old Chinese <sup>41</sup>	
* <i>seli</i>	‘young shoot’	* <i>lǎi</i>	‘bamboo sprout’
* <i>aliq</i>	‘move, change place’	* <i>lǎi?</i>	‘come to’
* <i>tulis</i>	‘stripes, writing’	* <i>lǎih</i>	‘pencil the eyebrows’
* <i>suliq</i>	‘sucker’	* <i>l-y-ǎi?</i>	‘the sucker tree’
* <i>uliq</i>	‘be in a position to’	* <i>l-y-ǎi?</i>	‘using, by means of’
* <i>daliq</i>	‘cause, motive’	* <i>l-y-ǎi?</i>	‘because’

Final *\*-?* and *\*-h* of the Old Chinese reconstructions are posited on the basis of Haudricourt’s (1954) proposal that Middle Chinese rising and falling tones were the outcomes of Old Chinese *\*-?* and *\*-h* respectively (whilst level tone reflected their absence). Sagart suggests that Old Chinese *\*-?* and *\*-h* in turn correspond with PAN *\*-q* and *\*-s* and were derived from PSAN *\*-q* and *\*-s*.

The lower three Old Chinese reconstructions above have recourse to infixation (*-y-*), which Sagart suggests was a characteristic of PSAN.

The main strengths of Sagart’s paper lie in his presentation of 106 regular comparisons and in his ability to account for the development of Middle Chinese tones from PSAN in a way which agrees with accepted theories of tonogenesis. One weakness lies in the fact that the semantic distance between the items compared is sometimes greater than desirable — but semantic identity can hardly be expected in comparisons between proto-languages allegedly spoken around 1000 B.C. (Old Chinese) and 3000 B.C. (PAN). Other weaknesses lie in the difficulties inherent in reconstructing Old Chinese (see Norman 1988: 42-48) and in the shortness of Chinese forms, which increases the chance of accidental resemblance.

Whereas it was inferred above from Blust’s theory of the PAN “root” that PAN disyllables developed from Pre-PAN monosyllables, Sagart makes the opposite assumption, proposing that Old Chinese monosyllables developed from PSAN disyllables by deleting the first syllable of the latter. His evidence for this lies in dialects of Middle Chinese which allowed initial consonant clusters. He cites the comparison PAN *\*buLút* ‘fibre’ and Old Chinese *\*l-y-ut* ‘writing brush’, together with its Middle Chinese (seventh

century A.D.) outcome *yuət*. He then points out that several Middle Chinese dialects have *p*-initial forms, e.g. Yan *pyuət*, as evidence that Old Chinese (or an earlier stage of Chinese) must have had a form such as *\*pl-y-ut*, i.e. a form which retained a reflex of the PSAN initial consonant reflected in PAN *\*buLút*. From forms like this, Sagart argues that whilst mainstream Old Chinese acquired monosyllabism by deleting PSAN initial syllables, some dialects deleted only the vowel of the initial syllable, at least in some items.

Sagart's PSAN hypothesis appears promising, but more decisive evidence for or against requires the amassing of a larger body of comparisons between Old Chinese and PAN and also further research into the reconstruction of a Proto-Chinese which would take account of a wider range of Chinese dialects. As Sagart points out, support for his hypothesis would not necessarily contradict the claim that Chinese belongs to the Sino-Tibetan language family, which is probably "unassailable" (Norman 1988: 13). It would mean, however, that the Austronesian family was a subgroup of an extended Sino-Tibetan.

The Austric hypothesis has its origins in Keane (1880), but it was Schmidt (1906) who proposed an "Austric" grouping comprising the Austro-Asiatic and Austronesian families and who coined these three terms. From the language map of mainland south-east Asia (see Wurm – Hattori 1983, map 25), it seems probable that the whole of this region — and perhaps a much larger area — was once occupied by Austro-Asiatic speakers. However, Tai-Kadai and Sino-Tibetan speakers have cut swathes into the region from the north and Austronesian speakers have taken over the coastal regions of the Malay Peninsula, leaving Austro-Asiatic speakers in occupation of scattered areas of mainland south-east Asia. Further afield, Austro-Asiatic languages are spoken in parts of India.

Perhaps the most conservative Austro-Asiatic language is spoken in the Nicobar Islands, some 200 kilometres north-west of Sumatra, and it is this which shows the clearest signs of a relationship with Austronesian. Reid (forthcoming) shows that Nicobarese has morphemes which are similar in both form and function to the PAN verbal morphemes *\*pa-* 'causative', *\*-um-* 'actor pivot/agent nominaliser', *\*ka-* 'inchoative', *\*ma-* 'undergoer pivot, involuntary', *\*-in-* 'perfective/patient nominaliser', and *\*-a* 'actor pivot, irrealis', the PAN ligature *\*na*, and perhaps also to PAN noun phrase markers ("determiners"). Reid argues that these are most unlikely to be Austronesian borrowings and indicates evidence that they are reconstructible for Proto-Austro-Asiatic. If this proves to be so, then it will be hard to deny a relationship between Proto-Austro-Asiatic and PAN. To support the Austric hypothesis, however, research is needed to seek out cognate vocabulary in

Austro-Asiatic and Austronesian languages and to establish sound correspondences between the two proto-languages.

Study of the external relationships of PAN is clearly still in its infancy, but we should note that the Austro-Tai, Sino-Austronesian and Austric hypotheses are not necessarily incompatible. Archaeological evidence suggests the possibility that the Tai-Kadai, Miao-Yao, Austro-Asiatic and Austronesian language families may all ultimately have arisen out of the cultures which resulted from the domestication of rice in the Yangtze Delta and spread across southern China as far as northern Thailand between about 6500 and 3000 B.C. (Bellwood forthcoming). The speakers of PAN or Pre-PAN were rice cultivators who probably first reached Taiwan from southeastern China between 4000 and 3000 B.C. The place of the Sino-Austronesian hypothesis in this scenario is less clear, since the ancestors of the Chinese came from north of the Yangtze and apparently adopted rice-growing later than this period.

---

### **Closing remarks**

---

Because this chapter is an attempt to expose the strengths and weaknesses of Austronesian linguistics — to indicate where I believe some of the “cutting edges” of the field may be — it is in a number of respects quite subjective and personal. This is inevitable: a scholar’s view of the needs for future research in his field is a product of his personal synthesis of that field and of the speculations which grow from it. Some of what is written here is certainly speculative and hopefully, provocative.

There are several areas which could have been included here but were not. One of these is sociolinguistic studies of situations involving Austronesian speakers. I did not write about this, because there is nothing archetypally Austronesian about Austronesian sociolinguistics. But such studies are certainly a prerequisite to a more thorough understanding of the linguistic history of the Austronesians. In this connection it is also clear that there are far too few detailed studies of single languages and of languages in contact — in short, too few data. We hope that the present volume will give some impetus to rectifying this situation.

A large portion of this essay has been taken up with a survey of Austronesian subgrouping — of what we understand and what we don’t understand. This is a choice which reflects my interests, but it is also the area in which scholars in other disciplines are most prone to ask questions, and sometimes to believe there must be answers where in fact there are still none. One point that emerges from this survey is that much research is needed not

---

only by linguists but also by archaeologists: the comparative linguist can reconstruct a sequence of events, and sometimes he can locate them, but he can never date them.

## Notes

1. I would like to thank Alexander Adelaar, Tom Dutton, Mary Ritchie Key, Bernd Nothofer, Andrew Pawley and Darrell Tryon for their comments on earlier drafts of this chapter. Of course, I am responsible for the use I have made of these. I have also benefitted considerably from discussions with Peter Bellwood, Adrian Clynes, Charles Grimes, Laurence Reid, and David Zorc and from letters from Robert Blust.
2. These terms are taken from Ross (1988: 7-8). Pawley – Green (1984) use the terms *network-breaking* and *radiation* in senses similar to our *dialect differentiation* and *separation*.
3. I use the term “Taiwan”, rather than “Formosa”, for the island, since this is its modern name, but retain conventional usage among Austronesian linguists by speaking of the island's Austronesian languages as “Formosan”, since the term “Taiwanese” is used for the island's most widely spoken Chinese dialect.
4. Dyen (1956) documents massive Malay borrowing in the Ngaju Dayak language of Borneo.
5. Cases of this are hard to document among Austronesian languages, but see Ross (1991a) for a probable case.
6. To determine cognacy with reasonable certainty, the investigator needs to know what phonological innovations each of the languages in question has undergone. But this entails the application of the time-consuming comparative method, which lexicostatistics was designed to avoid.
7. Examples of cases among the Austronesian languages of western Melanesia where language A has its highest percentage of shared cognates with language B, whilst language A shares a number of innovations with some third language which language B does not share, are given by Ross (1988, chapter 1).
8. Gaps occur in the table where no cognate occurs: for example, the Toba Batak word for ‘ear’ is *pingol*, a word which has replaced the expected form *\*taliŋa*.
9. If the proto-language under reconstruction is not at the apex of the genetic tree, evidence can be drawn from languages which are *not* descended from it. For example, if a decision were needed about whether to reconstruct two proto-phonemes or one in Proto-Oceanic (see Figure 2), we might examine languages of the putative South Halmahera/West New Guinea and Central Malayo-Polynesian groups. If all agreed in having two phonemes where some Oceanic languages had one, we could tentatively conclude that Proto-Oceanic had inherited two proto-phonemes and that some Oceanic languages shared a merger (and perhaps formed a subgroup). If all agreed in having one

phoneme, then the alternative conclusion would be supported. Until much more is known about the external relationships of Austronesian languages, however, PAN is at the apex of the genetic tree, and external evidence is not available.

10. Some scholars have argued for a conditioned split, but this enjoys only limited currency among Austronesian scholars (see Wolff 1991 and Ross 1991b).
11. As noted, the Formosan languages Amis and Bunun also share in the merger of PAN *\*C* and *\*t*, and may therefore form a subgroup with PMP. This is a hypothesis which needs further research.
12. Exceptions are Harvey (1982), who writes *\*t* and *\*t<sub>s</sub>*, and Dahl (1973, 1981), who writes *\*t<sub>1</sub>* and *\*t<sub>2</sub>*; both attribute the values [t] and [ʔ] to these proto-phonemes. Blust (1990a) writes *\*t* and *\*C*, but also attributes the values [t] and [ʔ] to them.
13. This problem was to some degree already present in Dempwolff's reconstructed system. His pairs *\*t'/\*d'* and *\*k'/g'* both ostensibly represented palatal sounds (1934: 15-16), but the phonetic distinction between them was not made clear.
14. Dyen and Tsuchida make considerable use of subnumeration, but this is shown here only where it affects equivalence between orthographies. The convention 'd-d-d' refers to word-initial, -medial, and -final instances of the phoneme.
15. The most radical attempt to make sense of PAN phonology is Wolff's (1988) reconstruction. However, his assumptions about Austronesian subgrouping differ from those described here, with the result that he gives less weight to Formosan data than other scholars have done and arrives at conclusions both about the phonological system and about phonetic values which are quite different from Blust's (1990b) account and from the account given here.
16. Sources of the materials in Table 4 are Li (1981) for Proto-Atayal, Tsuchida (1964) and Li (1978) for Saisiyat, Li (1976) for Thao, Tsuchida (1976) for Saaroa, Li (1977) for Proto-Rukai, Ting (1978) and Tsuchida (1983) for Proto-Puyuma, Ho (1978) for Proto-Paiwan. Materials for other languages are available (e.g. in Tsuchida 1976, Mei 1982, Li 1987) but they add no additional information to that present in Table 4.
17. Data supporting this reconstruction are found in the word lists under 06.910 and 09.265. See also the discussion in Harvey (1982).
18. Although Tsuchida (1976) retains the PAN palatals, it is noteworthy that he has few examples which contain any palatal other than *\*Z*.
19. Dahl (1981: 152) suggests tentatively that the value of *\*S<sub>2</sub>* was [z], whilst Li (1985) suggests [ʃ], but neither suggestion is justified by the Formosan reflexes.
20. There is substantial evidence that sound changes do occur which are stopped before they have affected all the relevant words in the language. For general discussion, see Chen – Wang (1975). For an Austronesian example, see Lincoln (1973).
21. Maddieson's data show a three-way phonemic contrast between /q/, /ʔ/ and /h/ or /fi/ in Kurdish (Indo-European), Arabic and Neo-Aramaic (Semitic), Sui (Kam-Tai), and in

- languages from a variety of Amerindian groups, as well as in the Formosan language Atayal (where present-day /ʔ/ does not, however, necessarily reflect PAN \*ʔ).
22. Dempwolff (1934) recognised only the form CV(C)CVC, positing no initial or final vowels and no vowel sequences. The modern reformulation is due to Dyen (1953).
  23. Egerod (1965, 1966) gives an account of the Atayal verb system, but in different terminology from mine.
  24. Starosta – Pawley – Reid (1982) present a revision and extension of proposals made by Pawley – Reid (1980).
  25. The hypothesis that all Austronesian languages outside Taiwan belong to a single subgroup was first proposed by Dahl (1973).
  26. Since the name of the Amis, who live on the south-west coast of Taiwan, seems to be derived from PAN \*qámiS ‘north’, (see item 12.470 in the word lists, and Reid 1982: 212, who makes a similar point.) it is possible that they were given this name by the Malayo-Polynesian speakers of the islands to the south, who remembered the Amis as their stay-at-home relatives. However, there is currently no linguistic support for this.
  27. The reader is referred to Dahl (1976: 74-75, 101, 131; 1981: 101-105) and to Blust (1976) for discussion of this seemingly incomplete merger.
  28. Reid (1990) discusses Negrito influence in certain Philippine languages, but does not refer to the South Mindanao group.
  29. Reid proposes a re-definition of terminology: the conventionally accepted Malayo-Polynesian group would become “Extra-Formosan” and the nasal infixation group would become “Malayo-Polynesian”.
  30. Nothofer (1988) continues a controversy ranging from Nothofer (1975) through Blust (1981) and Adelaar (1985, 1988). Here, however, I have attempted only to summarise the most recently expressed views of the protagonists.
  31. Note that this is a different use of the term ‘Hesperonesian’ than that coined by Dyen (1965b) and used by Tsuchida (1976) and Zorc in various publications.
  32. I am indebted to Charles Grimes for these examples.
  33. These innovations differ in their formulation somewhat from Blust’s not only because my reconstruction of PMP differs from his PAN, but also because I have checked data from a larger number of SHWNG languages and obtained somewhat different results.
  34. Grace’s orthography also included \*ns, but this is interpreted by Ross (1989b) as representing reflexes of \*s which arose independently by lenition processes in daughter-languages after the break-up of POC. Hence there is no POC symbol for it in the orthography used here.
  35. This material consists of word lists in Galis (1955), Cowan (1952) and Voorhoeve (1975), and short unpublished word lists by members of the Summer Institute of Linguistics.
  36. Geraghty’s work builds on foundations laid by others, chiefly Grace (1959), Biggs (1965), Pawley (1970, 1972), Hockett (1976) and Wilson (1982).

37. A more extensive account of the dispersal of Oceanic languages is given by Pawley and Ross (forthcoming).
38. Data and argument supporting this are contained in an unpublished manuscript by the writer.
39. Although on subgrouping grounds Tonga is a good candidate for the location where a Central Pacific dialect evolved into Proto-Polynesian, the fact that Samoa was settled at about the same time as Tonga causes some puzzlement. Proto-Polynesian is so rich in innovations that its immediate break-up is not tenable. Either Proto-Polynesian developed as a dialect chain embracing Tonga, Niuafo'ou, Samoa and perhaps Futuna and Uvea, or (more probably) it developed in one island group and replaced Central Pacific dialects spoken in the others. (I am grateful to Andrew Pawley for bringing this point to my attention.)
40. In more recent work, Benedict's "Tai-Kadai" and Kam-Sui groups and the "Ong-Be" language are combined into a Kam-Tai grouping with three subgroups: Tai, Li ("Kadai") and Kam-Sui. "Ong-Be" (spoken on Hainan Island) is known as Lingao or Vo Limkou, and is attributed to the Tai subgroup (Wang 1987). The Miao-Yao language is not considered to belong to this grouping (Sun 1987).
41. Sagart's transcriptions are here re-transcribed in accordance with the conventions of the present work.

---

## 4. Listing of Austronesian languages

---

**Barbara F. Grimes**

**Joseph E. Grimes**

**Malcolm D. Ross**

**Charles E. Grimes**

**Darrell T. Tryon**

---

The inventory of Austronesian languages that follows is adapted from the Cornell-SIL Language Archive, the data base from which the 1988 *Ethnologue: languages of the world* (eleventh edition) was drawn. The Archive itself is the work of the first two authors: the last three present significant updates within that framework, particularly in the language classification.

Such a catalogue of languages necessarily depends on the quality and availability of the primary sources. The list represents interaction with primary researchers over a period of years. One aim has been to clarify what the primary researchers mean by relative terms such as “language”, “dialect”, “closely related”, and “clearly distinct”. Why have they chosen to use one particular name for a language in place of others used in the literature previously? Do their figures for number of speakers reflect the number of active users? the total number of those identified with the ethnic group regardless of whether or not a significant portion of the ethnic group have shifted completely to another language? first and second language speakers together?

The issues are varied and complex, and each language listed is a fascinating reflection of the sum of the linguistic, social, historical, political and geographical factors that belong to the speech community in question. In one area the social attitudes and political dynamics may force two speech communities that are linguistically close (in phonology, morpho-syntax, and lexicon) to be considered separate languages. In another area different social dynamics may create pressure to list as a single language two speech communities that are linguistically much more diverse and where intelligibility is marginally or significantly blocked. Or there may be extensive chaining effects that have simply not been sorted out well enough yet to give a partitioning of an area that reflects the actual communication potential of the speech varieties that are in use. The issues are complex, and the quest for an accurate picture is not made easier when one linguist’s “dialect” is another linguist’s “language”.

---

---

The reader is referred to the *Ethnologue* and its companion *Ethnologue index* for more details related to each language, a bibliography, and an index of language names, alternate names, dialect names and dialect alternates.

The listing of Austronesian languages presented here includes alternate names, dialects, current classification, location, and number of speakers, where known. Further details on such things as bilingualism, number of speakers of each dialect, second language speakers, evaluation of accuracy of the data for an area, and more may be found in the 1988 *Ethnologue*.

**Alternate Names:** Many times the language name used by its neighbours is not the name used by the speakers themselves. Furthermore, the literature on a language often uses different terms altogether, often using the name of a village where initial contact was made as a term for the language group as a whole. Listing alternate names is an attempt to keep these networks of information tied to the proper speech communities.

**Dialects:** The assumption is that all the dialects listed for a language are intelligible with neighbouring dialects, or with a standard variety where chaining is involved.

**Classification:** Higher-level classification for Austronesian languages follows Blust (various). The basis for intermediate-level classification and problems with that is discussed by Tryon (this volume) and Ross (this volume). Sources for lower-level classification are listed in the bibliography of the *Ethnologue* and the introductory chapters to this present volume.

**Location:** The primary country with which a language is associated is listed along with more specific details.

**Population:** Figures are given for many languages. In most cases these figures represent the total number of speakers for all areas in which a language is spoken.

The present listing does *not* include languages that are confirmed to be extinct.

#### Summary breakdown of Austronesian languages

Formosan languages		14
Western Malayo-Polynesian languages	WMP	529
Central Malayo-Polynesian languages	CMP	150
Central-Eastern Malayo-Polynesian languages (unclassified as to CMP or SHWNG)	CEMP	2
South Halmahera-West New Guinea languages	SHWNG	39
Oceanic languages	OC	468
<b>TOTAL Austronesian languages listed</b>	<b>AN</b>	<b>1202</b>

A'ARA see MARINGE.

ABADI see GABADI.

ABAI SUNGAI *Class.* WMP, Borneo, Northeast, Paitanic. *Loc.* Malaysia, Sabah. Lower reaches of the Kinabatangan River. *Pop.* 500.

ABAKNON see SAMA, ABAKNON.

ABENLEN see AYTA, ABENLEN.

ABORLAN TAGBANWA see TAGBANWA.

ABUNG *Dial.* JABUNG, MENGGALA (NORTHEAST LAMPUNG), KOTA BUMI (NORTHWEST LAMPUNG). *Class.* WMP, Lampungic, Abung. *Loc.* Indonesia, Sumatra. South. *Pop.* 500,000.

ABURLIN NEGRITO see AYTA, ABENLEN.

ACEH *Alt.* ATJEH, ATJEHNESE, ACHINESE, ACHEHNESE. *Dial.* BANDA ACEH, BARUH, BUENG, DAJA, PASE, PIDIE (PEDIR, TIMU), TUNONG. *Class.* WMP, Aceh-Chamic, Aceh. *Loc.* Indonesia, Sumatra. Northern, Aceh Province, northern and southern coasts around tip of Sumatra. *Pop.* 2,400,000.

ACHEHNESE see ACEH.

ACHINESE see ACEH.

ACIRA see ADZERA.

ADASEN *Alt.* ADDASEN TINGUIAN, ADDASEN, ADASEN ITNEG. *Dial.* EASTERN ADDASEN, WESTERN ADDASEN. *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran, Ibanagic. *Loc.* Philippines. Luzon, northeastern Abra Province. *Pop.* 4,000

ADASEN ITNEG see ADASEN.

ADDASEN see ADASEN.

ADDASEN TINGUIAN see ADASEN.

ADJIO see TAJIO.

ADLAI see ROGLAI, NORTHERN.

ADZERA *Alt.* AZERA, ATZERA, ACIRA. *Dial.* CENTRAL, AMARI, NGAROWAPUM, YARUS, GURUF/NGARIAWANG, TSUMANGGORUN. *Class.* OC, WOC, North New Guinea, Huon Gulf, Markham, Upper Markham, Adzera. *Loc.* Papua New Guinea. Morobe Province, Markham Valley, Kaiapit District. *Pop.* 20,700.

'AEKE see HAEKE.

AEKE see HAEKE.

AETA NEGRITO see SAMBAL, BOTOLAN.

AGERLEP see AIKLEP.

AGIYAN see AGTA, CAMARINES NORTE.

AGOMES see HERMIT.

**AGTA, ALABAT ISLAND** *Alt.* ALABAT ISLAND DUMAGAT. *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran, Dumagat. *Loc.* Philippines. East of Quezon Province, Luzon. *Pop.* 50

---

**AGTA, CAMARINES NORTE** *Alt.* MANIDE, AGIYAN. *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran, Dumagat. *Loc.* Philippines. Luzon, Santa Elena and Labo, Camarines Norte. *Pop.* 200

---

**AGTA, CASIGURAN** *Alt.* CASIGURAN DUMAGAT. *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran, Dumagat, Northern. *Loc.* Philippines. East coast of Luzon, north Quezon Province. *Pop.* 1,000

---

**AGTA, CENTRAL CAGAYAN** *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran, Dumagat. *Loc.* Philippines. Northeast Luzon. *Pop.* 1,000

---

**AGTA, EASTERN CAGAYAN** *Alt.* DUPANINAN AGTA. *Dial.* YAGA, TANGLAGAN, SANTA ANA-GONZAGA, BARONGAGUNAY, PALAUI ISLAND, CAMONAYAN, VALLEY COVE, BOLOS POINT, PEÑABLANCA, ROSO (SOUTHEAST CAGAYAN), SANTA MARGARITA. *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran, Dumagat, Northern. *Loc.* Philippines. Northeast Luzon, from below Divilacan Bay in the south to Palau Island in the north. *Pop.* 1,200

---

**AGTA, ISAROG** *Class.* WMP, Meso Philippine, Central Philippine, Bikol. *Loc.* Philippines. Mt. Isarog east of Naga City, Bicol Province, Luzon. *Pop.* A few speakers.

---

**AGTA, MT. IRAYA** *Alt.* INAGTA OF MT. IRAYA, RUGNOT OF LAKE BUHI EAST, LAKE BUHI EAST, ITBEG RUGNOT. *Class.* WMP, Meso Philippine, Central Philippine, Bikol. *Loc.* Philippines. East of Lake Buhi, Bicol Province, Luzon. *Pop.* 200

---

**AGTA, MT. IRIGA** *Alt.* SAN RAMON INAGTA, LAKE BUHI WEST, MT. IRIGA NEGRITO. *Class.* WMP, Meso Philippine, Central Philippine, Bikol. *Loc.* Philippines. East of Iriga City, west of Lake Buhi, Bicol Province, Luzon. *Pop.* 1,500

---

**AGTA, REMONTADO** *Alt.* HATANG-KAYEY, SINAUNA. *Class.* WMP, Northern Philippine, Bashiic-Central Luzon-Northern Mindoro, Central Luzon, Sambalic, Sinauna. *Loc.* Philippines. Luzon; Santa Inez, Rizal Province; Paimohuan, General Nakar, Quezon Province. *Pop.* 1,000 to 2,000

---

**AGTA, VILLAVICIOSA** *Class.* WMP, Northern Philippine, Northern Luzon, Northern Cordilleran. *Loc.* Philippines. Luzon, Abra Province.

---

# 1. Atayal

**Contributor:**

**Introduction and Wordlist:** *Paul Jen-kuei Li*

## 1. Introduction

The Atayalic group of Formosan languages occupies the northern half of Taiwan, covering eight out of sixteen prefectures in Taiwan, with a population of 76,000 as of 1989. It is comprised of Atayal and Sediq, each with various dialects of its own. Atayal, in turn, consists of two major dialect groups, Squliq and C<sup>?</sup>uli<sup>?</sup> (Ts<sup>?</sup>ole). The Squliq dialects are all fairly uniform and considered the prestige dialects, whereas the C<sup>?</sup>uli<sup>?</sup> dialects can be quite divergent from each other. The Sediq dialects are neither completely uniform nor very divergent. See Li (1980, 1981). In the Atayalic group, Mayrinax is by far the most conservative dialect and hence the most valuable for historical reconstruction. Of all Formosan languages and dialects, it is the only known dialect that shows certain well-defined differences between the speech of men and of women (Li 1982b). It is therefore the dialect used for the Atayal wordlist.

Map 1. Atayal language area

Alternate names of Atayal, that have appeared in previous literature include Tayal and Ataiyal.

Below is a brief description of the phonology and morphology of Atayal.

## 2. Phonology

### 2.1 Phonetic description and distribution

*Table 1.* Atayal consonants

	Bilabial	Alveolar	Alveo-palatal	Velar	Uvular	Glottal
Stops/Affricates	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	<i>q̣</i>	<i>ʔ</i>
Fricatives	<i>v</i> l		<i>š</i>	<i>x</i>		<i>h</i>
	<i>v</i> d	<i>β</i>	<i>ž</i>	<i>ɣ</i>		
Nasals	<i>m</i>	<i>n</i>		<i>ŋ</i>		
Laterals		<i>ɬ</i>				
Flaps		<i>r</i>				
Semivowels	<i>w</i>		<i>y</i>			

*Table 2.* Atayal vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid		<i>ə</i>	
Low		<i>a</i>	

Atayal has 19 consonants: voiceless stops /p, t, k, q̣, ʔ/, voiceless affricate /č/, voiceless fricatives /š, x, h/, voiced fricatives /β, ž, ɣ/, nasals /m, n, ŋ/, liquids /l, r/, two semi-vowels /w, y/ and four vowels /i, u, ə, a/. In addition, there are the following four diphthongs: /aw, ay, uy, iy/. Phonetically /q̣/ is a voiceless uvular stop, /č, š, ž/ are all alveo-palatal, /h/ is pharyngealised, /l/ is a lateral fricative and /r/ a flap. There is phonemic contrast between /ʔ/ and zero in all positions, e.g. /apit/ ‘flying squirrel’, /ʔakčuy/ ‘throat’. Vowel /ə/ rarely occurs in the final stressed syllable. The only example I have found so far is /βakəš/ ‘scar’.

All consonants except /ʒ/, which may not occur word-finally, occur word-initially, medially and finally. /x/ occurs word-initially only rarely in a few items, e.g. /xuxuʔ/ ‘breasts’, /xuyil/ ‘dog’.

Stress falls on the final syllable of content words. Function words have no stress.

## 2.2 Consonant clusters and vowel sequences

Consonant clusters in word-initial position are mostly composed of a consonant followed by a semivowel, e.g. /kwalax/ ‘rain’, /ʃyatuʔ/ ‘clothes’. A combination of two true consonants in the initial position is less common, such as /ɣrup/ [ɣəʔrup] ‘plant sp. (*Bidens pilosa* L. Var. *minor* (Bl) Sherrf.)’, /kɣiy/ ‘hemp’, /βhut/ ‘squirrel’, /hmaʔ/ ‘tongue’, /khuŋ/ ‘type of wild mushroom’. In word-medial position, such combinations are fairly common: /kiʔman/ ‘grass’, /βalkaʔ/, ‘bamboo shoots’, /βanʔu/ ‘type of bamboo’, /βasβus/ ‘cotton’, /kayčap/ ‘a tool to peel hemp’, /mahnuʔk/ ‘soft’, /halhul/ ‘warm’, /humɣuβ/ ‘to do magic’, /lihkaʔ, lihβaw/ ‘light (weight)’. There is no consonant cluster in word-final position. A phonetically weak vowel [ə] generally occurs between true consonants, e.g. /akliʔ/ [akələʔ] ‘leopard’, especially in word-initial position, e.g. /hmuk/[həmok] ‘urine’.

Due to the loss of PAN \*l and occasionally of PAN \*R in this dialect, vowel sequences or long vowels occur, e.g.

- (1) /k-um-aiʔ/ ‘to dig’ < PAN \*k<sup>l</sup>ih
- (2) /βua-tiŋ/ ‘moon’ < PAN \*bulaL
- (3) /kaiʔ/ ‘language’ < PAN \*kaRi
- (4) /kaum/ ‘anteater’ < PAN \*qaRum

Also a word may begin or end with a vowel, e.g. /ihuk/ ‘strawberry’ and /riŋku/ ‘corpse’. Thus the typical Austronesian word structure CV(C)CVC is disrupted in the Mayrinax dialect of Atayal.

## 2.3 Alternations

The Atayalic group of languages and dialects generally has the most complex phonology among all the Formosan languages. Sqliq, for instance, manifests many morphophonemic alternations (see Egerod 1965, Li 1980). However Mayrinax, the most conservative dialect, shows far fewer alternations than the other dialects. For example,

1.  $\check{c} \sim t < \text{PAN } *C \text{ or } *d'$ 

	Agent-focus	Non-agent-focus	PAN	
(1)	<i>k-um-at</i>	<i>káč-un</i>	< <i>*kaRaC</i>	'to bite'
(2)	<i>ḱ-um-aluit</i>	<i>ḱaluič-un</i>	< <i>*qaLud</i>	'to flow'
(3)	<i>maḱut</i>	<i>paḱuč-an</i>		'to ask'

2.  $\check{s} \sim y < \text{PAN } *g'$ 

	Agent-focus	Non-agent-focus	PAN	
(1)	<i>ma-βāy</i>	<i>β-in-aš-un</i>	<i>*bəlɨj</i>	'to buy'
(2)	<i>r-um-ahiy</i>	<i>rahiš-an</i>		'to dry in the air'
(3)	<i>k-um-a-kyiy</i>	<i>kyiš-an</i>		'to prepare hemp'

## 3. Deletion of stem-initial consonant

Another type of alternation, which is widespread in western Austronesian languages, has to do with the deletion of the stem-initial obstruents when the agent-focused marker *m-* is present.

	Agent-focus	Non-agent-focus	Imperatives	
(1)	<i>muŋ</i>	<i>puŋ-an</i>	<i>puŋ, puŋ-i</i>	'to listen'
(2)	<i>mataš</i>	<i>pataš-an</i>	<i>pataš-i</i>	'to write, draw'
(3)	<i>muḱ</i>	<i>βuḱ-an</i>	<i>βuḱ-i</i>	'to squeeze'
(4)	<i>manik</i>	<i>ḱ-in-anik-an,</i> <i>naniḱ-un</i>	<i>ḱanik,</i> <i>ḱanik-i</i>	'to eat'
(5)	<i>mahmut</i>	<i>khamt-un</i>		'to act randomly'

4. Vowels in non-stressed syllables may be dropped or phonetically reduced to [ə]. In the following examples, vowels that may be dropped are underlined:

(1)	<i>h-um-y<u>u</u>β</i>	'to do magic'
	<i>h<u>a</u>βy-i haŋ</i>	'Please do magic!'
	<i>h-in-<u>a</u>βy-an</i>	'to have done magic'
	<i>ha-h<u>a</u>yβ-un</i>	'will do magic'
(2)	<i>š-um-in-<u>a</u>piyal</i>	'to have dreamed'
	<i>pa-š<u>p</u>iyal-i</i>	'Dream!'
(3)	<i>m-<u>a</u>hm<u>u</u>t, khamt-un</i>	'to act indiscriminately'
(4)	<i>m-kahtuy, pakahty-an, pakhaty-i</i>	'to come out'
(5)	<i>r-um-<u>a</u>ŋluŋ, rŋilŋ-i</i>	'to hinder, to stop'
(6)	<i>č-um-p<u>u</u>ŋ, čapŋi-i</i>	'to measure,
	<i>ča-čapŋ-an</i>	a ruler'

### 3. Morphology

There are many prefixes, a few infixes and some suffixes in Atayal. Given below are illustrations of some of the Atayal affixes. It is possible to combine a few affixes, e.g. *-um-in-*, *-in-...-an*. The prefix *may-* occurs only in the Mayrinax dialect of Atayal. This form is not cognate with *mag-* in Philippine languages.

#### 3.1 Verbal prefixes

##### 1a *ma-* 'stative'

<i>ma-βka?</i>	'broken'
<i>ma-puluŋ</i>	'deaf'

##### 1b *ma-* 'active'

<i>ma-βilβil</i>	'to tremble, to shiver'
<i>ma-βihuy</i>	'to bend'
<i>ma-βāy</i>	'to buy'

##### 2. *man-*

<i>man-čakruy</i>	'to stand up'
<i>man-βaxβax</i>	'loose (soil)'
<i>man-čahū?</i>	'straight'

##### 3. *mana-*

<i>mana-ku<sup>?</sup>um</i>	'overcast'
<i>mana-huḱil</i>	'to die'
<i>mana-hmuhmut</i>	'messy'
<i>mana-mai?</i>	'to boil'

##### 4. *may-*

<i>may-βatu-nux</i>	'pretty'
<i>may-turakiš</i>	'yellow'
<i>may-lakām</i>	'to go head-hunting'
<i>may-yuhiβuŋ</i>	'purple'

##### 5. *ma-ša-* 'reciprocal, mutual'

<i>ma-ša-ši-<sup>?</sup>ahay</i>	'to marry'
<i>ma-ša-šipu<sup>?</sup></i>	'to have sexual intercourse'

6. *ma-ši-* ‘natural release or movement’

<i>ma-ši-ŋaŋay</i>	‘to dribble’	<	<i>ŋaŋay</i>	‘saliva’
<i>ma-ši-hmuḵ</i>	‘to urinate’	<	<i>hmuḵ</i>	‘urine’
<i>ma-ši-rinwaŋ</i>	‘to sweat’	<	<i>rinwaŋ</i>	‘sweat (n)’
<i>ma-ši-ḵuti?</i>	‘to defecate’	<	<i>ḵuti?</i>	‘excrement’
<i>ma-ši-luhiy</i>	‘to have landslide’			

7. *pana-*

<i>pana-turiŋ</i>	‘to point at’, compare <i>tiruliŋ</i> ‘finger’
-------------------	--

8. *ma-ti-*

<i>ma-ti-βaynay</i>	‘to sell’, compare <i>ma-βaynay</i> ‘to buy’
---------------------	--

9. *?i-*

<i>?i-ra-rauḵ</i>	‘low’	<	<i>rauḵ</i>	‘earth, ground’
-------------------	-------	---	-------------	-----------------

10. *pa-* ‘causative’

<i>pa-ḵan-iḵ</i>	‘to feed’	<	<i>ḵan-iḵ</i>	‘to eat’
<i>pa-tari?</i>	‘to tie up’	<	<i>tari?</i>	‘to tie a knot’
<i>pa-p-tayhuk</i>	‘to touch’	<	<i>tayhuk</i>	‘arrive, reach’

11. *ši-* ‘benefactive’

<i>ši-βaynay</i>	‘to buy something for someone’
------------------	--------------------------------

12. *ga-* ‘verbaliser’

<i>ga-hapuy</i>	‘to cook’	<	<i>hapuy</i>	‘fire’
-----------------	-----------	---	--------------	--------

13. *kan-* + RED + N (body parts) ‘body movement’

<i>kan-ta-tari?</i>	‘to kneel’	<	<i>tari?</i>	‘knee’
<i>kan-ča-čri?</i>	‘to kick’			
<i>kan-ta-tki?</i>	‘to squat’			

14. *ma-ka-* ‘mutual, reciprocal’

<i>ma-ka-kuyus</i>	‘to shave each other’
--------------------	-----------------------

15. *maki-* ‘active verb’

<i>maki-βaḵ</i>	‘to learn’	<	<i>βaḵ-un</i>	‘to know’
-----------------	------------	---	---------------	-----------

16. *mat-* ‘to turn’

<i>mat-mayray</i>	‘to turn something around’
<i>mat-kayran</i>	‘to turn around something’

17. *mi-*

<i>mi-tutul</i>	‘to wake up’
<i>mi-βaβwax</i>	‘to take off upper garment’

18. *paš-*

---

*paš-akčuy* 'to cough' < *akčuy* 'throat'

---

19. *ta...-an* 'location'

*ta-tuβun-an* 'temple, church', compare *t-um-uβun* 'to worship'

---

20. *tiyi-* 'to release gas'

*tiyi-ḱuti?* 'to break wind' < *ḱuti?* 'excrement'

---

21. *tu-* 'for some to...'

*tu-lḱiŋ* 'for someone to hide', compare *l-um-ḱiŋ* 'to hide something'

---

## 3.2 Verbal infixes

1. *-um-* 'agent focus'

*l-um-aŋuy* 'to swim'

---

*γ-um-alik* 'to tear'

---

*h-um-aβ* 'to stab'

---

2. *-in-* 'completive'

*t-in-apih* 'to have beckoned'

---

*h-in-aγβ-an* 'to have done magic'

---

*l-in-huy-an* 'to have threaded or strung'

---

*γ-in-išuna?* 'to have breathed' < *γišuna?* 'Breathe!'

---

*č-in-uliŋ-an* 'to have burned'

---

## 3.3 Verbal suffixes

1. *-an* 'locative focus'

*yuway-an* 'a ford, to ford'

---

*?ariŋ-an* 'to begin'

---

2. *-un* 'object focus'

*ḱašuy-un* 'to distribute, to share'

---

*raŋa?-un* 'to coax'

---

3. *-i* 'imperative'

*pašihuβ-i* 'Suck it!'

---

4. *-aw* 'future or mild request'

<i>yauβ-aw taʔ</i>	'Let's share one cup (of wine)!'
<i>nayaʔ-aw mišuʔ</i>	'I'll wait for you.'
<i>ʔiŋač-aw mu</i>	'I'll seize it'

5. *-ani* 'polite request'

<i>βinaš-ani</i>	'Please buy it!'
<i>rahiš-ani</i>	'Please dry it!'
<i>βiŋ-ani</i>	'Please give it to him!'

## 3.4 Nominal affixes

1. *-in-* 'nominaliser'

Verb or noun		Noun	
<i>t-um-inuŋ</i>	'to weave'	<i>t-in-inuŋ</i>	'spider web, beehive'
<i>kaŋaŋ</i>	'village'	<i>ŋ-in-alaŋ</i>	'fence'

2. *-in-...-an* 'nominaliser to indicate a completed action'

Verb	Noun	
<i>ŋ-um-umiʔ</i>	<i>ŋ-in-umiʔ-an</i>	'pickled vegetables'
<i>t-um-imamiʔ</i>	<i>t-in-mamiʔ-an</i>	'pickled meat'
<i>š-um-βil</i>	<i>š-in-uβil-an</i>	'leftover'
<i>ʔariŋ</i>	<i>k-in-ʔariŋ-an</i>	'origin, source, ancestor'
<i>pasihuβ</i>	<i>p-in-sihuβ-an</i>	'sucked juice or blood'

## 3.5 Male affixes

The following affixes all indicate male forms of speech (see Li 1983):

1.	<i>-niŋ</i>	<i>hapu-niŋ</i>	'fire'
		<i>kahu-niŋ</i>	'tree, wood'
2.	<i>-ik</i>	<i>ran-ik</i>	'road'
		<i>šibil-ik</i>	'lunchbox'
3.	<i>-ʔiŋ</i>	<i>ča-ča-ʔiŋ</i>	'thread'
4.	<i>-hiŋ</i>	<i>ku-hiŋ</i>	'head louse'
5.	<i>-iŋ</i>	<i>kaβuβ-iŋ</i>	'hat'
		<i>šitu-iŋ</i>	'clothes'

6.	-tiŋ	<i>βua-tiŋ</i>	'moon'
7.	-riʔ	<i>ḳapu-riʔ</i> <i>ḳu-riʔ</i>	'earwax, kernel' 'gray hair'
8.	-ḳiʔ	<i>lu-ḳiʔ</i>	'marrow'
9.	-niʔ	<i>raḳ-niʔ</i> <i>ḳua-niʔ</i>	'branch' 'rattan'
10.	-nux	<i>lata-nux</i> <i>ɣiʔ-nux</i>	'front yard' 'tooth'
11.	-ux	<i>ḳuri-ux</i> <i>ramu-ux</i>	'ginger' 'blood'
12.	-hu	<i>k-um-ai-hu</i>	'to dig'
13.	-u	<i>βuliḳ-u</i>	'star'
14.	-al	<i>ʔuniy-al</i> <i>š-um-api-al</i>	'to come' 'to dream'
15.	-liʔ	<i>ḳumu-liʔ</i> <i>ḳaβu-liʔ</i>	'rice cake' 'ashes'
16.	-kaʔ	<i>lih-kaʔ</i>	'light (weight)'
17.	-ha	<i>pčiy-ha</i>	'chest'
18.	-il	<i>ha-haβ-il</i>	'loincloth'
19.	-in-	<i>ḳaš-in-uɣ</i> <i>βuš in uk</i>	'beast' 'drunk'
20.	-il-	<i>ɣuḳ-il-uh</i> <i>mat-il-uḳ</i>	'banana' 'raw'
21.	-i-	<i>luh-i-uŋ</i> <i>rul-i-uɣ</i>	'mortar' 'top of tree'
22.	-a-	<i>ḳ-um-alu-a-p</i> <i>h-um-aku-a-t</i>	'to hunt' 'to carry'
23.	-na-	<i>raḳi-na-š</i> <i>š-um-ayu-na-ɣ</i>	'face' 'to substitute'

### 3.6 Reduplication

Reduplication of the first syllable of the stem indicates a tool. For example:

Noun		Verb	
<i>ka-kai-hu</i>	'a spade'	<i>k-um-ai-hu</i>	'to dig'
<i>ta-taβul</i>	'a plough'	<i>t-um-aβul</i>	'to till, 'to cultivate (land)'
<i>ka-kluʔ</i>	'door'	<i>k-um-luʔ</i>	'to close'
<i>ka-kamil</i>	'fingernail, claw'	<i>k-um-amil</i>	'to scratch'

Note that the reduplicated vowel is always /a/.

## 2. Tsou

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Shigeru Tsuchida</i>
--

---

---

### 1. Introduction

---

---

The Tsou /çou/ language is spoken by approximately 4,200 speakers (1976) in Wu-feng County, Chia-yi Province (嘉義縣吳鳳鄉), and in Hsin-yi County, Nan-t'ou Province (南投縣信義鄉). It is reported that there were four dialects in Tsou: Tapangu /tapaŋi/, Tfuea /tfuea/, Duhtu /duhtu/, and Iimutsu /ĩmuçu/, but no Iimutsu speakers have survived, and thus no details are known of the dialect. The differences of the other three dialects concern only some minor phonological and lexical features, and the speakers of different dialects face no problem in communicating with each other. Tapangu and Tfuea reportedly have a phonemic stress. According to my own observation, stress is non-distinctive in Duhtu. There are two other notable phonological differences: (1) /z/ in Tfuea and Duhtu corresponds to /i/ in Tapangu (Tp. *meŋiu*, Tf. *meŋzu*, Dt. *meŋzu* 'spear'); (2) /r/ immediately followed by /e/ in Duhtu corresponds to Tp, Tf zero in stressed word-initial position and in unstressed medial position, and to /e/ elsewhere (Dt. *tresi*, Tp, Tf *tēsi* 'rope'; Dt. *remi*, Tp, Tf *emi* 'alcoholic drink'; Dt. *xire*, Tp, Tf *xie* 'sun'; Dt. *rsī*, Tp, Tf *esī* 'tears'; Dt. *siru*, Tp, Tf *sieu* 'salt'). The following description is based on the data from Duhtu, where I stayed for about two months in summer, 1970.

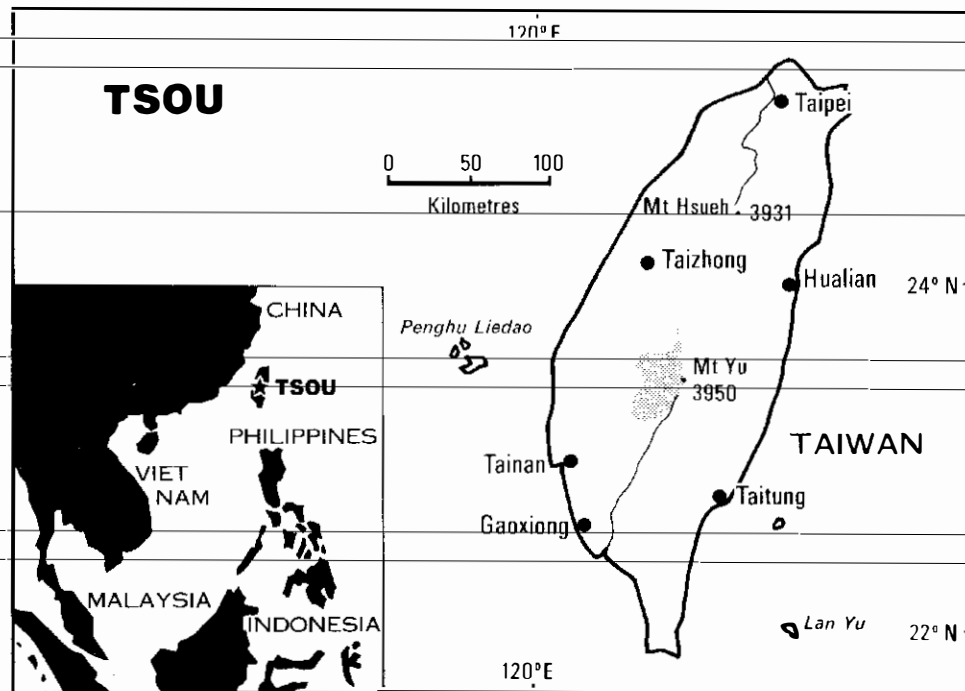

Duhtu is spoken by about 150 speakers at Chou-mei Village in Hsin-yi County, Nan-t'ou Province (南投縣信義鄉久美村). The Bunun are dominant today in the population in this area, and intermarriages between the two ethnic groups are very common. Many of the Duhtu people, especially women, can speak Bunun fluently.

In the Duhtu village are found three types of speakers: (1) those who more or less constantly retain /r/; (2) those who do not have /r/, and thus have the same phonemic inventory as that in Tfuea, except perhaps for stress; (3) those who have free variants with and without /r/. Few speakers belong to the first type above and are mostly older than sixty years of age (in 1970); they number probably less than ten. Although they pronounce /r/ consistently when asked to pronounce words in isolation, the /r/ sometimes

---

---

does not appear when they tell a story. Speakers who belong to type (2) are mostly women and those who are closely affiliated to Tfuea, such as those who have many relatives in the Tfuea village. It is conspicuous, however, that preconsonantal word-initial /e/ (= /r/ with speakers of type (1)) never occurs in the speech of speakers of type (2): /sī/ for /rsī/ (Tf /esī/) ‘tears’. All the rest belong to type (3). It should be noted in passing that among the Duhtu people Tfuea is considered better than Duhtu in every respect: speech, customs and the way of life.

Map 2: Tsou language area

## 2. Phonology

Table 1. Tsou (Duhtu) consonants

		Labial	Alveolar	Velar	Glottal
Stops	vɿ	<i>p</i>	<i>t</i>	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>		
Affricates			ʈ		
Fricatives	vɿ	<i>f</i>	<i>s</i>	<i>x</i>	
	vd	<i>v</i>	<i>z</i>		
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Trills			<i>r</i>		

Table 2. Tsou (Duhtu) vowels

	Front	Central	Back
High	<i>i</i>	<i>ɨ</i>	<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Tsou (Duhtu dialect) has sixteen consonant phonemes and six vowel phonemes: /p, t, ʈ, k, ʔ, b, d, f, s, x, v, z, m, n, ŋ, r, i, e, a, o u i/. Besides these, /l, j/ occur in loanwords. Stress is not distinctive: it usually falls on the penultimate syllable of a word, and varies freely depending on the speaker and even within the speech of a single informant, but it never falls on the ultimate syllable.

/p/ is [p], a voiceless bilabial stop: /puzu/ ‘fire’

/t/ is [t], a voiceless apical stop: /tutu/ ‘kernel of fruit’

/ʈ/ is [č], a voiceless palato-alveolar affricate when followed by /i/, and elsewhere [ʈ], a voiceless alveolar affricate: /ʈiʈvi/ [čiʈvi] ‘to leak (of the roof)’

/k/ is [k], a voiceless velar stop: /koru/ ‘ear’

/ʔ/ is [ʔ], a glottal stop: /ʔoŋi/ ‘a string or a cord, whose one end is attached to something, as the clapper-bell string, or mosquito-net strings’; cf. /oŋi/ ‘charcoal’

/b/ is [β], a voiced bilabial implosive: /boni/ ‘to eat’

/d/ is [ɗ], a voiced apical implosive: /duŋu/ ‘a fish hook’

/f/ is [f], a voiceless labiodental fricative: /fatu/ ‘stone’

/s/ is [š], a voiceless palato-alveolar fricative when followed by /i/, and elsewhere [s], a voiceless alveolar fricative: /sifu/ [šifu] ‘urine’, /sini/ [sini] ‘neck’

/v/ is [v], a voiced labiodental fricative: /viči/ ‘vine’

/x/ is [x], a voiceless velar fricative: /xire/ ‘sun’

/z/ is [ž], a voiced palato-alveolar fricative when followed by /i/, and elsewhere [z], a voiced alveolar fricative (slightly palatalised): /teʔzi/ [teʔži] ‘to defecate on’, /zomi/ [zomi] ‘bird’

/m/ is [m], a voiced bilabial nasal: /mimo/ ‘to drink’

/n/ is [n], a voiced apical nasal: /nomi/ ‘six’

/ŋ/ is [ŋ], a voiced velar nasal: /ŋaro/ ‘mouth’

/r/ is [r], a voiced retroflex approximant as in English: /remi/ ‘alcoholic drink in general’

/l/ is [ɾ], a voiced tongue-tip flap, which occurs only in loanwords: /amelika/ ‘Westerners’ (from Japanese)

/j/ is [j], a voiced palato-alveolar affricate, which occurs only in loanwords: /laʃio/ ‘radio’ (from Japanese, ultimately from English)

/a/ is [a], low central unrounded: /ʔadi/ ‘wound’

/e/ is [ɛ], lower midfront unrounded: /edi/ ‘to find’

/i/ is [i], high front unrounded: /niʔu/ ‘to warm oneself at the fire’

/o/ is [ɔ], lower mid back rounded: /fozu/ ‘much (of liquid)’

/u/ is [u], high back rounded: /fuzu/ ‘wild pig’

/i/ is [i], high central unrounded: /niʔi/ ‘nose’

### 3. Morphology

In the comparative lexicon, non-actor-focus forms (or passive forms), if available, are given in parentheses for each verb.

Tsou morphophonemic alternations are too complicated to be stated briefly, as may be observed in examples of actor/non-actor focus forms.

Please refer to Tung (1964) and Tsuchida (1976:87-93).

Morpheme boundaries indicated by a hyphen are of course working hypotheses, and thus may not be quite consistent in many cases.

### 3. Rukai

---

---

**Contributor:**

Introduction and Wordlist: *Paul Jen-kuei Li*

---

---

#### 1. Introduction

---

---

Rukai is a Formosan language spoken in southern Taiwan, with a population of 6,100 as of 1989. It has two main dialect groups: (1) Rukai proper – Budai, Tanan and Labuan, and (2) the “Lower Three Villages” – Maga, Tona and Mantaوران. The former is located to the west and east, while the latter is located to the north. These dialect groups differ not only geographically, but also, to a certain extent, culturally and linguistically. The internal relationships of these dialects can be represented as:

---

---

Each of the Rukai tribes has its own tribal name that is also used to refer to the village: Tanan is called *taromak*, Maga *tulđika*, Tona *kođadavan* and Mantaوران *?oponoho*. The Tanan village used to be called *tsarisen*, but the same term has also been used to designate the northern Paiwan.

In terms of phonological change, Budai is the most conservative and hence used for the Rukai wordlist. Drastic sound changes have taken place in Mantaوران, and to a lesser extent in Maga.

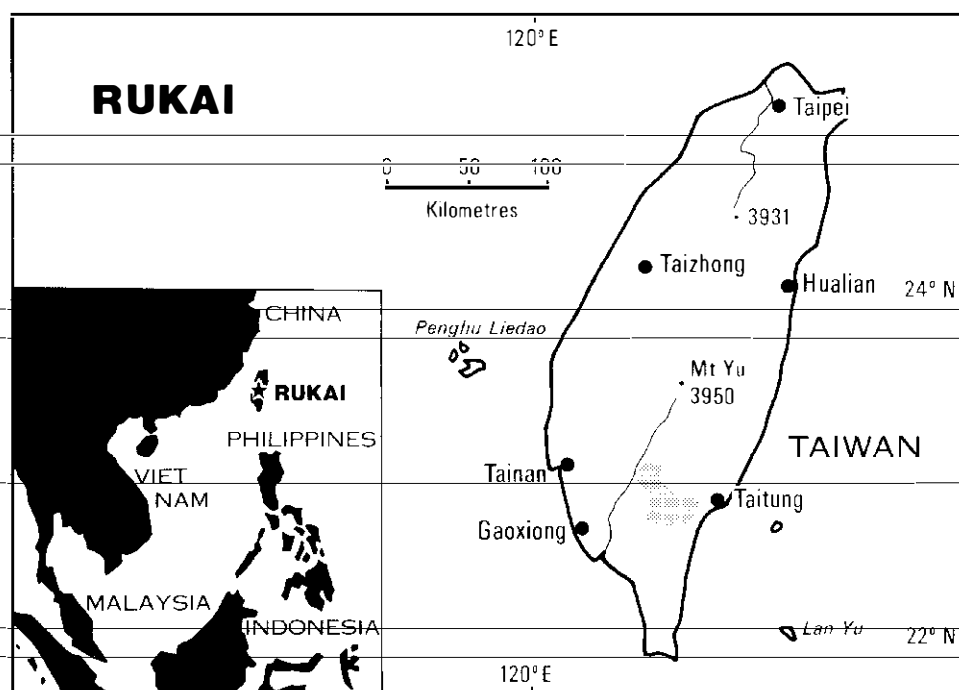

The position of Rukai in the Formosan languages is still controversial. Some scholars such as Shigeru Tsuchida (1976) and Isidore Dyen believe

---

---

that Rukai is closer to Tsou, while the others including Ho (1983) and myself still hold the traditional view that it is one of the Paiwanic languages.

Map 3. Rukai language area

## 2. Phonology

### 2.1 Inventory of consonants and vowels

Table 1. Consonants

		Labial	Dental/Alveolar	Retroflex	Velar
Stops	v	<i>p</i>	<i>t</i>		<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>ɖ</i>	<i>g</i>
Affricates			<i>ʈ</i>		
Fricatives	v		<i>θ</i>		
	vd	<i>v</i>	<i>ð</i>		
Sibilants			<i>s</i>		
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>
Laterals			<i>l</i>	<i>ɭ</i>	
Trills			<i>r</i>		
Semivowels		<i>w</i>	<i>y</i>		

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid		<i>ə</i>	
Low		<i>a</i>	

## 2.2 Phonetic description and distribution

The voiceless stops /p, t, k/ and the affricate /tʃ/ are unaspirated. /tʃ/ is treated as a single unit rather than as a consonant cluster because there is no consonant cluster other than those formed by the semivowels /y, w/ following syllable-initial consonants in the same syllable. /b, d, ɖ, g/ have rather strong voicing throughout. /t, d/ are dentals, /θ, ð/ interdental, and /tʃ, s, n, l/ alveolars. /tʃ, s/ are palatalised before /i/. /r/ is a weak trill. /d, l/ are retroflexed.

Vowel /o/ is phonetically realised as [o]. Phonetically long vowels can be treated as geminates.

Stress is phonemic. It falls mostly on the penultimate syllable, but less frequently on the final or antepenult, e.g. /va'saw/ 'leaf', /bə'ləbələ/ 'banana'.

No true consonant appears in the word-final position. Every word ends with a vowel, either a monophthong or diphthong. If it is a monophthong in the word-final, it may be just an echo vowel of the preceding syllable.

## 2.3 Alternations

### 1. Echo vowels

An echo vowel is generally dropped when it is immediately followed by a suffix that begins with a vowel. For example:

Agent-focused	Imperative	
<i>wa-takilili</i>	<i>takilil-a</i>	'to hang or hold (in hand)'
<i>wa-ałogo</i>	<i>ałog-a</i>	'to hold up'
<i>wa-tətərə</i>	<i>tətər-a</i>	'to kick'
<i>wa-łibatə</i>	<i>łibat-a</i>	'to pass'

However, note that in /wa-sipi/ 'to dream', /sipi-a/ 'dream!' the stem-final vowel /i/ is retained in the suffixed form. Compare /wa-asipi/ 'to count', /asip-a/ 'count!' < Proto-Southern Formosan (PSF) \**qasip*. A careful study

will reveal that an echo vowel is dropped when suffixed if it was a late phonetic development in the language, whereas a stem-final vowel is always retained if it was historically derived, e.g. /wa-pili/ ‘to choose’, /pili-a/ ‘choose!’ < PAN \**piliq*.

## 2. Alternations of *y* ~ *ǝ* and *w* ~ *v*.

When the semivowels /*y*, *w*/ are followed by a vowel across a morpheme boundary, they become the fricatives /*ǝ*, *v*/ respectively:

	Agent-focused	Imperative	
(1)	<i>wa-ǰalay</i>	<i>ǰalaǝ-a</i>	‘to dance’
	<i>wa-paǰay</i>	<i>paǰaǝ-a</i>	‘to kill’
	<i>ŋy-a-palay</i>	<i>ŋi-palaǝ-a</i>	‘to fly’
(2)	<i>mo-a-baḷiw</i>	<i>mo-baḷiv-a</i>	‘to return home’
	<i>wa-kawkaw</i>	<i>kawkav-a</i>	‘to shout, to cry’
	<i>wa-sinaw</i>	<i>sinav-a</i>	‘to wash’

## 3. Alternations of *i* ~ *y* and *w* ~ *v*.

	Agent-focused	Imperative	
(1)	<i>ky-a-lala</i>	<i>ki-lala-a</i>	‘to listen’
	<i>ŋy-a-talaysi</i>	<i>ŋi-talays-a</i>	‘to swing’
(2)	<i>mw-a-ǰili</i>	<i>mu-ǰili-a</i>	‘to drop’
	<i>tw-a-baḷə</i>	<i>tu-baḷə-a</i>	‘to answer’

## 3. Morphology

### 3.1 Reduplication

#### 1. Reduplication of the noun stem

##### (1) N + RED ‘a great amount’

Reduplication of the noun stem indicates a great amount or number. For example:

/daə/	‘soil’	>	/daə-daə/	‘earth, land’
/omasə/	‘person’	>	/oma-omasə/	‘many people’
/a-ŋato/	‘tree’	>	/a-ŋato-ŋato/	‘woods, forest’

##### (2) N(numeral or period) + RED ‘lasting for a period of...’. For example:

<i>ḷima</i>	‘five’	>	<i>ḷima-ḷima</i>	‘to last for five days’
<i>ǰail</i>	‘year’	>	<i>ǰai-ǰail</i>	‘to last for a year’

## 2. Reduplication of the verb stem

(1) V + RED 'continuous, keep doing, do repeatedly'. For example:

<i>davaɕ</i>	'walk/leave'	>	<i>da-davaɕ</i>	'be walking/leaving'
			<i>dava-davaɕ</i>	'keep walking'
<i>tobi</i>	'cry'	>	<i>tobi-tobi</i>	'be crying'

(2) V + RED 'future'. For example:

<i>to-lalak</i>	'have a baby'	>	<i>to-la-lalak</i>	'will have a baby'
<i>davaɕ</i>	'walk/leave'	>	<i>dava-davaɕ</i>	'will walk/leave'

(3) V(stative) + RED 'intensity, comparatively greater'. For example:

<i>mā-ɖaw</i>	'big'	>	<i>mā-ɖa-ɖaw</i>	'rather big, to grow up'
<i>mo-aɖiŋay</i>	'delicious'	>	<i>mo-aɖi-aɖiŋay</i>	'rather delicious'

## 3. Reduplication of a Bound Stem

A reduplicated form may be derived from a bound stem, whose meaning may not be known, as in:

<i>ɖərə-ɖərə</i>	'thunder'
<i>ɖarə-ɖarə</i>	'light, twinkle like a star'
<i>ləgə-ləgə</i>	'mountain'
<i>ŋisi-ŋisi</i>	'beard'
<i>oma-oma</i>	'swidden field' < PAN * <i>qumah</i>
<i>wa-koso-koso</i>	'to scrape'
<i>baɖa-baɖa</i>	'stranger' < <i>baɖa</i> 'enemy'

## 3.2 Nominal affixes

(1) *ka-...-anə* + N 'something real or genuine'. For example:

<i>ka-loaŋ-anə</i>	'cow, literally a real bull or cow' < PHN * <i>Nuaŋ</i>
<i>ka-bava-anə</i>	'mead, fermented drink, literally real wine'
<i>ka-daɭan-anə</i>	'road' < PAN * <i>Zalan</i>
<i>ka-biɕəɭak-anə</i>	'middle, centre'

(2) *ko-* + Pronoun 'nominative'. For example:

<i>ko ake</i>	'I'
<i>ko-so</i>	'you (sg.)'
<i>ko-ta</i>	'we (inc.)'
<i>ko-nai</i>	'we (exc.)'

(3) *moasaka-* + N (numeral) ‘ordinal’. For example:

<i>moasaka-va-əva</i>	‘first’ < <i>əθa</i> ‘one’
<i>moasaka-ḍosa</i>	‘second’ < <i>ḍosa</i> ‘two’
<i>moasaka-toʃo</i>	‘third’ < <i>toʃo</i> ‘three’

(4) *sa-...-anə* + V ‘instrument, tool’. For example:

<i>sa-səvər-anə</i>	‘wind’, see <i>ma-sa-səvərə</i> ‘to blow (wind)’
<i>sa-toŋo-toŋoʃ-anə</i>	‘beak’, see <i>w-a-toŋoʃo</i> ‘to peck’
<i>sa-ḍokor-anə</i>	‘latch, door-bolt’
<i>sa-to-a-tom-anə</i>	‘tool’ < <i>tomanə</i> ‘to do’

(5) *sa-* + N ‘some body parts’. For example:

<i>sa-kəʃəpə</i>	‘eyebrow’
<i>sa-kobo-kobo</i>	‘eyelash’
<i>sa-taətəʃə</i>	‘molar tooth’
<i>sa-pakə-pakə</i>	‘a wing without feather’

(6) *ta-...-anə* + N ‘location, time’. For example:

<i>ta-balaŋa-anə</i>	‘shoulder’
<i>ta-si-kaʃa-kaʃaθ-anə</i>	‘wrist’
<i>ta-apə-apəʃ-anə</i>	‘room’, literally ‘a place to sleep’ < <i>w-a-apəʃə</i> ‘to sleep’
<i>ta-pia-pia-pia-anə</i>	‘often’ < PAN * <i>pijah</i>

(7) *ta-ra* + N ‘agentive, a person specialised in...’. For example:

<i>ta-ra-ʃai-ʃaisi</i>	‘tailor’ < <i>ʃaisi</i> string, ‘cord’
<i>ta-ra-to-kāŋə</i>	‘fisherman’ < <i>kāŋə</i> ‘fish’

### 3.3 Verbal affixes

(1) *-a-* + V ‘realis’ (see also *w-a-* + V). For example:

<i>w-a-paliʃi</i>	‘to twist’ < <i>paliʃi</i>
<i>mo-a-bələ-bələŋ</i>	‘to rise’ < <i>bələŋ</i> ‘above’
<i>ki-a-ḍəmə-ḍəmə</i>	‘to think’
<i>ŋi-a-palidiŋ</i>	‘to turn’
<i>to-a-ʃavay</i>	‘to weed’
<i>i-a-kai</i>	‘to exist, to have’

(2) *-a + V* 'imperative'. For example:

<i>ɕii-a</i>	'Throw it!'
<i>ɕabo-a</i>	'Wrap it!'
<i>tapoθ -a</i>	'Winnow it!'
<i>swap-a</i>	'Sweep!' < <i>swapə</i> 'broom'

(3) *ki- + N* 'to gather, to collect, to harvest'. For example:

<i>ki-aŋato</i>	'to gather wood' < <i>aŋato</i> wood'
<i>ki-a-ɕoboso</i>	'to harvest sugarcane' < <i>ɕoboso</i> 'sugarcane'
<i>ki-a-kali</i>	'to harvest yam' < <i>kali</i> 'yam'
<i>ki-a-sabiki</i>	'to pick betel' < <i>sabiki</i> 'betelnut'
<i>ki-a-vaga</i>	'to ask' < <i>vaga</i> 'word, language'

(4) *ki- + V* 'Dative-focus, involuntary action'. For example:

<i>ki-a-laɭa</i>	'to hear'
<i>ki-a-kəlanə</i>	'to have fits and starts'
<i>ki-a-pəlay</i>	'to float'
<i>ki-a-ɭəpəŋ</i>	'to crouch'
<i>ki-a-ɖiŋay</i>	'to find'
<i>ki-a-ləpəŋə</i>	'(for people) to hide themselves'

(5) *ko- + N* 'to remove, to peel'. For example:

<i>ko-a-laŋiɕ</i>	'to flay, to skin' < <i>laŋiɕ</i> 'animal skin'
<i>ko-a-ŋiɕo</i>	'to peel' < <i>ŋiɕo</i> 'peelings of fruits or tubers'

(6) *ko- + V* 'intransitive, Patient-focus'. For example:

<i>ko-a-laobo</i>	'to burn'
-------------------	-----------

(7) *ma- + V* 'mutual, reciprocal'. For example:

<i>ma-kaɭisi</i>	'to quarrel'
<i>ma-ɖa-ɖəsəŋ</i>	'to meet'

(8) *mā- + V* 'stative'. For example:

<i>mā-kəɕəŋə</i>	'strong'
<i>mā-ɭopi</i>	'weak'
<i>mā-ɕəəmə</i>	'sick, ill'
<i>mā-pilay</i>	'lame'
<i>mā-silaw</i>	'hungry'

(9) *mo-* + N ‘to discharge, to remove’. For example:

<i>mo-a-ɕaki</i>	‘to defecate’ < <i>ɕake</i> ‘excrement’
<i>mo-a-laymay</i>	‘to be stripped of clothes, naked’ < <i>laymay</i> ‘clothes’

(10) *mo-* + V ‘(to go) self-motion, non-causative’. For example:

<i>mo-a-rənərə</i>	‘(for a living being) to sink into water’
<i>mo-a-ɖiŋi</i>	‘(for an object) to sink into water’
<i>mo-a-θənə</i>	‘to sink as in a quicksand’
<i>mo-a-ɕili</i>	‘to fall, drop’, compare <i>wa-ɕili</i> ‘to throw’
<i>mo-a-lakay</i>	‘to laugh’
<i>mo-a-baliw</i>	‘to return home’
<i>mo-a-balakə</i>	‘to swell’
<i>mo-a-lodo</i>	‘to flow’

(11) *ŋi-* + V ‘to act or to move in a certain manner or direction’. For example:

<i>ŋi-a-boray</i>	‘to boil’ < <i>boɭay</i>
<i>ŋi-a-vələ-vələ</i>	‘to move’ < <i>vələvələ</i>
<i>ŋi-a-palay</i>	‘to fly’ < <i>palay</i>
<i>ŋi-a-talaisi</i>	‘to swing’ < <i>talaisi</i>
<i>ŋi-a-ɖa-ɖə-ɖəŋərə</i>	‘to boast’ < <i>ɖəŋərə</i>
<i>ŋi-a-θiŋalə</i>	‘wise’ < <i>θiŋalə</i>

(12) *ŋo-* + N ‘to ride’. For example:

<i>ŋo-a-rigi</i>	‘to ride’ < <i>rigi</i> ‘horse’
------------------	---------------------------------

(13) *pa-* + V ‘causative’. For example:

<i>pa-paɕay</i>	‘to kill’ < <i>paɕay</i> ‘to die’
<i>pa-ki-a-saɭə</i>	‘to lend’ < <i>ki-a-saɭə</i> ‘to borrow’
<i>pa-o-vagay</i>	‘to divide’, compare <i>mā-vagay</i> ‘divided, separated’
<i>pa-ɖələ</i>	‘to show’, compare <i>w-a-ɖələ</i> ‘to see’
<i>pa-ɕoŋolo</i>	‘to explain’, compare <i>w-a-ɕoŋolo</i> ‘to link’

(14) *si-* + V (bound stem) ‘verbal prefix’. For example:

<i>si-a-ɭibo</i>	‘to pound (rice)’
<i>si-a-oli</i>	‘to return, to revive’

(15) *si-* + N ‘to wear, to carry, to possess’. For example:

<i>si-a-laymay</i>	‘to wear clothes’ < <i>laymay</i> ‘clothes’
--------------------	---

(16) *so-* + N ‘to spit, to clean, to give out’. For example:

<i>so-a-ŋaɭay</i>	‘to spit’ < <i>ŋaɭay</i> ‘saliva’
<i>so-a-ŋoraŋoro</i>	‘to snore’

(17) *to-* + N ‘to make, produce, bring forth’. For example:

<i>to-a-lalakə</i>	‘to give birth’ < <i>lalakə</i> ‘child’ < PAN * <i>aLak</i>
<i>to-a-sapa</i>	‘to weave a mat’ < <i>sapa</i> ‘mat’ < PAN * <i>SapaR</i>
<i>to-a-dānə</i>	‘to build a house’ < <i>dānə</i> ‘house’

(18) *θi-* + N ‘to release’. For example:

<i>θi-loro</i>	‘to urinate’ < <i>loro</i> ‘urine’
----------------	------------------------------------

(19) *w-* + V ‘Agent-focus, verbal prefix’. For example:

<i>w-a-laobo</i>	‘to burn (transitive)’
<i>w-a-swapə</i>	‘to sweep’ < <i>swapə</i> ‘broom’

## 4. Paiwan

---

---

**Contributor:**

Introduction and Wordlist : *Dah-an Ho*

---

---

### 1. Introduction

---

---

#### 1.1 Location and population

Paiwan is the name of the language spoken by the people who call themselves Sə-Paiwan, which means ‘mountain people’. These people live in the mountainous area of the Ping-Tung and Tai-tung prefectures, which are located in the southernmost part of Taiwan (Formosa). Their neighbours include the Rukai, Puyuma, Ami and Yami. Among the aboriginal peoples in Formosa, Paiwan has the second largest population next to the Ami, who are located on the eastern coast. According to the last 1964 census, the population of the Paiwan was 44,682, approximately one-fifth of all the aboriginal peoples on the island. And it is believed that the number has increased greatly during recent decades.

---

---

#### 1.2 Dialects

---

---

Dialects vary to different degrees from village to village. The most significant phonological features that distinguish the dialects are the presence of the palatal sounds *c*, and *ɟ*, as well as the uvular stop *ɕ*. The Tjuabar dialect, on which this comparative dictionary is based, contains all three sounds. Some other dialects, for example, Stimul, merge *c*, and *ɟ* with *t* and *d* respectively, and substitute the glottal stop *ʔ* for uvular *ɕ*, as the following comparisons show:

---

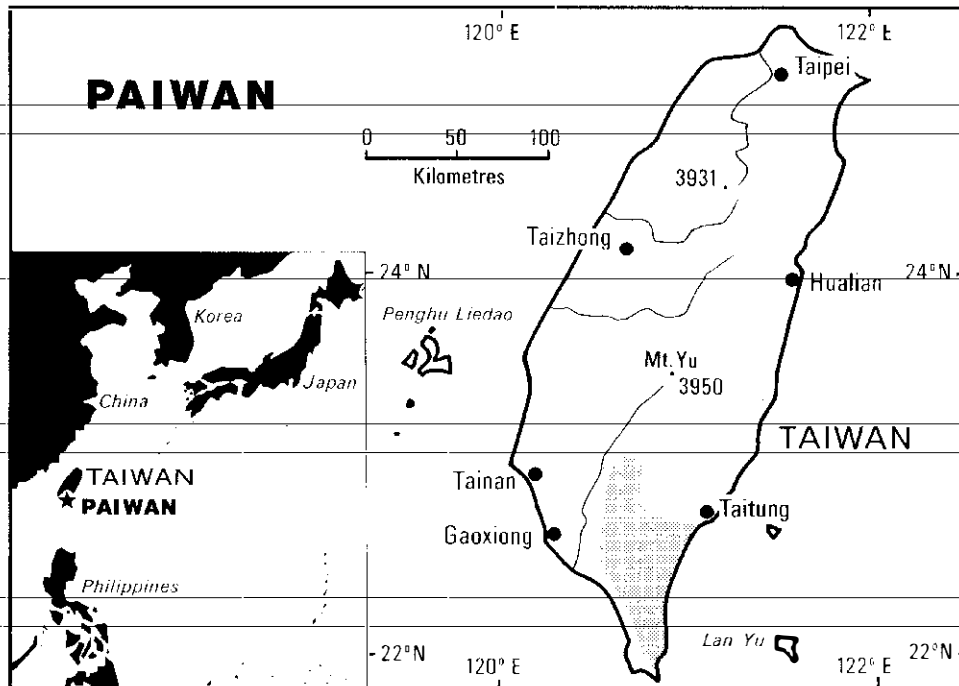

---

	Tjuabar	Stimul	
{	<i>cəvus</i> <i>ta-caɕ-an</i>	<i>təvus</i> <i>ta-taʔ-an</i>	‘sugarcane’ ‘whetstone’
{	<i>ɕacuvi</i> <i>ɕatia</i>	<i>ʔatuvi</i> <i>ʔatia</i>	‘snake’ ‘salt’
{	<i>vuc</i> <i>viduat</i>	<i>vut</i> <i>viduat</i>	‘squirrel’ ‘rib’

---

---

{	<i>Jamug</i> <i>daʎək</i>	<i>damuʔ</i> <i>daʎək</i>	‘blood’ ‘drizzle’
{	<i>yujus</i> <i>mudinən</i>	<i>yudus</i> <i>mudinən</i>	‘nose’ ‘face’
{	<i>ḱ-əm-iʎaʎ</i> <i>taḱəd</i>	<i>ʔ-əm-iʎad</i> <i>taʔəd</i>	‘to sit’ ‘to sleep’

Map 4: Paiwan language area

Additional evidence for dialect distance can be found in the lexicon:

Tjuabar	Stimul	
<i>pakəaw</i>	<i>sutaw</i>	‘peanut’
<i>ḱiḱi</i>	<i>ʔaʎaʎ</i>	‘pig, swine’
<i>caḱuḱən</i>	<i>təkəza</i>	‘bridge’
<i>ʎaum</i>	<i>ʎigim</i>	‘needle’
<i>ḱadupu</i>	<i>sunat</i>	‘paper’
<i>ḱidar</i>	<i>sinlaʎ</i>	‘twins’
<i>kamaḱulʔ</i>	<i>sili</i>	‘pepper’
<i>ḱaiʎ</i>	<i>laviʎən</i>	‘monkey’
<i>guʎ</i>	<i>luʎ</i>	‘cow’

The dialects of Paiwan may be subgrouped into two branches, the palatal group or the *c*-group, and the apical group or *t*-group with Tjuabar and Stimul as its representatives respectively. But geographically and demographically speaking, the *t*-group is much smaller than the *c*-group. Currently, the *t*-group only occupies the northwest corner of Paiwan territory. The sound changes that it underwent mark innovations in the dialect.

## 2. Phonology

### 2.1 Phonemes

There are four vowels (i, u, ə, a), two semi-vowels (y, w) and 20 consonants in Paiwan (Tjuabar). The articulatory positions and manners of consonants are as follows:

*Table 1. Consonants*

		Labial	Dental	Retroflex	Palatal	Velar	Uvular
Stops	vl	<i>p</i>	<i>t</i>		<i>c</i>	<i>k</i>	<i>ḱ</i>
	vd	<i>b</i>	<i>d</i>	<i>ɖ</i>	<i>ɟ</i>	<i>g</i>	
Affricates			<i>ʈ</i>				
Fricatives	vl		<i>s</i>				
	vd	<i>v</i>	<i>z</i>				
Nasals		<i>m</i>	<i>n</i>			<i>ŋ</i>	
Laterals				<i>ɭ</i>	<i>ɭʲ</i>		
Trills			<i>r</i>				

*Table 2. Vowels*

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid		<i>ə</i>	
Low		<i>a</i>	

The high vowels *i* and *u* are pronounced [e] and [o] respectively before or after uvular stop *ḱ*. The central vowel *ə* is raised as [i] after sibilants *ʃ*, *s*, and *z*.

The syllable structure is (C)V(C). A consonant cluster within a syllable has never been discovered. A word may be composed of one or more syllables. The ə vowel will appear automatically when two consonants are next to each other within a word due to reduplication or affixation. This additional ə, however, will be lost in rapid speech, especially when it follows a nasal consonant *m*, *n*, or *ŋ*.

Stress always falls on the penultimate vowel. Thus it is non-phonemic. The stressed vowel is always a little longer than the unstressed ones.

## 2.2 Morphophonemic alternations

Two neighbouring identical vowels will be reduced to one in Paiwan, e.g. *k-əm-əsa-əŋa* > *k-əm-əsa-ŋa* ‘have cooked’; *mi-isiḱ* > *m-isiḱ* ‘to urinate’. In addition, there are two important morphophonemic alternations: /w ~ v/, and /m ~ n/.

### 2.2.1 w ~ v

A word-final /w/ will change to a /v/ when a vowel-initial suffix is added. Thus in the following comparison:

- (a) *s-əm-əŋaw* ‘to wash’ : *səŋav-u* ‘Wash!’  
 (b) *kasiw* ‘wood’ : *pu-kasiv-an* ‘a room to store wood’

Thus stem final /w/ alternates with a labio-dental /v/. It must be noted, however, that the suffix which causes stem final /w/ to change to /v/ must be monosyllabic. If the suffix contains two or more syllables, and thus bears main stress after suffixation, the alternation is prohibited. For example, in *ki-kasiw-əŋa* ‘the wood has been collected’, and *ki-kasiw-akən* ‘I collect wood’, /v/ is not substituted for the /w/.

### 2.2.2 m ~ n

Infix *-əm-*, when inserted into the first syllable of a stem, can derive a verb from a noun, e.g. *kava* ‘clothes’, and *k-əm-ava* ‘to put on clothes’. It also marks the present aspect of a verb like *k-əm-an* ‘to eat’, *s-əm-upu* ‘to count’. When *-əm-* is preceded by a labial sound, or the second syllable of the stem has a labial initial that is preceded by /ə/, the *-əm-* will be changed to *-ən-*. Examples are: *p-ən-aysu* ‘to pound’ (cf. *paysu* ‘rice’), *t-ən-(ə)və!a* ‘to answer’ (cf. *təvə!a-u* ‘Answer!’).

### 3. Morphology

#### 3.1 Reduplication

Reduplication and affixation are two important morphological processes in Paiwan. Reduplication always differentiates degrees of attributes, while affixation marks tense/aspect differences, or derives new words. Examples of reduplicated forms are as follows:

<i>ḵata-ḵata</i>	‘little beads’,	cf. <i>ḵata</i>	‘beads’
<i>buḷa-buḷay</i>	‘very beautiful’,	cf. <i>buḷay</i>	‘beautiful’
<i>ḵ-əm-al<sup>y</sup>u-ḵal<sup>y</sup>up</i>	‘to be hunting’,	cf. <i>ḵ-əm-al<sup>y</sup>up</i>	‘to hunt’
<i>cuku-cuku</i>	‘the late <i>cuku</i> ’,	cf. <i>cuku</i>	‘a name of a man who is living’

These words should be differentiated from other classes of words which may be labeled as quasi-reduplicates. Quasi-reduplicates are those words that lack the corresponding unreduplicated forms, e.g. *ḵiḵi* ‘pig, swine’, *ḵisḵis* ‘beard’.

#### 3.2 Affixation

Prefixes, infixes and suffixes are productively used in Paiwan. For the sake of brevity, here we will give only a few common affixes which form nouns, verbs and adjectives.

##### 3.2.1 Nouns

- (1) *-al-*, *-al<sup>y</sup>-* ‘tiny things’  
*v-al-ul<sup>y</sup>a-vul<sup>y</sup>an* ‘fine hair’  
*v-al-uḵavun* ‘crumbs’  
*k-al<sup>y</sup>-iḵkiḵ* ‘a flash, a glimpse’
- (2) *-in-* ‘things made from the root’  
*c-in-ənun* ‘textile, cloth’, cf. *c-əm-ənun* ‘to spin and weave’  
*l<sup>y</sup>-in-avia* ‘straw hut’, cf. *l<sup>y</sup>avia* ‘straw’
- (3) *-an* ‘place’ (always used with another affix)  
*ḵ-in-akis-an* ‘that thread that is under sewing’, cf. *ḵ-əm-akis*  
‘to sew’  
*ka-kəsa-(a)n* ‘kitchen’, cf. *k-əm-(ə)sa* ‘to cook’  
*ka-tapav-an* ‘the parent's house’, cf. *tapaw* ‘hut’

*papu-siav-an* 'the bowl for containing soup', cf. *siaw* 'soup'  
*k(u)-umaw-an* 'inside the house', cf. *umaw* 'house'

(4) *mar(ə)-* 'a pair of' (used for humans only)

*marə-ʔəkəlʸ* 'a couple', cf. *ʔəkəlʸ* 'spouse'

*marə-vuvu* 'grandparent and grandchildren' cf. *vuvu*  
 'grandparent' or 'grandchildren'

*mar-alʸak* 'parent and children', cf. *alʸak* 'child, children'

(5) *pu-* 'rich'

*pu-varuŋ* 'a man who labours mentally', cf. *varuŋ* 'heart, mind'

*pu-paysu* 'richer', cf. *paysu* 'money'

*pu-lami* 'a harvest', cf. *lami* 'crops'

(6) *kay-* 'vegetation'

*kay-ŋuay* 'a kind of taro'

*kay-ŋadəlʸ* 'a kind of pineapple'

*kay-daw* 'a kind of tree'

(7) *sə-* 'inhabitants'

*sə-ʔəmalʸipa* 'people of *ʔəmalʸipa*', cf. *malʸipa* 'name of a tribe'

*sə-cuabar* 'people who come from Tjuabar'

(8) *cua-* 'name of a tribe'

*cua-kaʔilʸay* 'name of a tribe', cf. *kaʔilʸay* 'stone'

*cu(a)-abar* 'Tjuabar', cf. *abar* 'a kind of fruit'

### 3.2.2 Verbs

(1) *-aŋa* 'already done'

*vaik-aŋa* 'to have gone', cf. *vaik* 'to go'

*k-əm-an-aŋa* 'to have eaten', cf. *k-əm-an* 'to eat'

(2) *ka-* 'to complete'

*ka-kəsa* 'well cooked', cf. *k-əm-(ə)sa* 'to cook'

*k(a)-alʸak* 'to give birth', cf. *alʸak* 'child'

(3) *kə-* 'to do something oneself'

*kə-vəʔa* 'I cheat', cf. *v-ən-(ə)ʔa* 'to cheat'

*kə-vava* 'to drink alone', cf. *vava* 'wine'

- (4) *ki-* 'to do something to oneself'  
*ki-paʕay* 'to commit suicide', cf. *paʕay* 'to kill'  
*ki-pavai* 'to give something to oneself', cf. *pavai* 'to give'  
*ki-səʕas* 'to hurt oneself', cf. *s-əm-(ə)ʕas* 'to hurt, to chop'
- (5) *kisu-* 'to get rid of'  
*kisu-kava* 'to take off clothes', cf. *kava* 'clothes'  
*kisu-alʕak* 'to practise birth control', cf. *alʕak* 'child, children'
- (6) *kicu-* 'to do something separately'  
*kicu-vava* 'to drink separately', cf. *vava* 'wine'  
*kicu-varuŋ* 'to make decisions separately', cf. *varuŋ* 'heart, mind'
- (7) *maCa-* 'to do something reciprocally' (where C indicates the initial consonant of the stem)  
*maʕa-ʕuziŋ* 'to squeeze each other', cf. *ʕ-əm-iziŋ* 'to squeeze'  
*masa-səʕas* 'to chop reciprocally', cf. *s-əm-(ə)ʕas* 'to chop, to hurt'
- (8) *mə-* 'to experience, to be something'  
*mə-kuʕal* 'to be corpulent', cf. *kuʕal* 'fatty'  
*mə-cad* 'to be draughty'
- (9) *pa-* 'to cause someone to do something'  
*pa-kan* 'to feed', cf. *k-əm-an* 'to eat'  
*pa-ʕay* 'to kill', cf. *ma-ʕay* 'dead'
- (10) *pu-* 'to produce, to get something'  
*pu-vasa* 'to plant taro', cf. *vasa* 'taro'  
*pu-zalʕum* 'to get water', cf. *zalʕum* 'water'
- (11) *sa-* 'to be willing to do something'  
*sa-t-əm-(ə)kə!* 'would like to drink water', cf. *t-əm-(ə)kə!* 'to drink water'  
*sa-vaik* 'would like to go', cf. *vaik* 'to go'
- (12) *calʕu-* 'to arrive at'  
*calʕu-cumaq* 'to arrive at home', cf. *cumaq* 'home'  
*calʕu-ʕ-in-alʕ-an* 'to reach the tribe', cf. *ʕ-in-alʕ-an* 'village, tribe'.

## 3.2.3 Adjectives

- |     |                                 |   |
|-----|---------------------------------|---|
| (1) | <i>ma-</i>                      | ‘being’   |
|     | <i>ma-bəruŋ</i>                 | ‘is leaking’, cf. <i>bəruŋ</i> ‘a hole’                           |
|     | <i>ma-cani</i>                  | ‘is falling’, cf. <i>c-əm-ani</i> ‘to put down’                   |
|     | <i>ma-sadaw</i>                 | ‘wounded’, cf. <i>s-əm-adaw</i> ‘to cut’                          |
| (2) | <i>na-</i>                      | ‘with the quality of’   |
|     | <i>na-ŋuaḱ</i>                  | ‘better’, cf. <i>ŋuaḱ</i> ‘good’                                  |
|     | <i>na-sa-uḱal<sup>y</sup>ay</i> | ‘handsome’, cf. <i>sa-uḱal<sup>y</sup>ay</i> ‘handsome young man’ |
| (3) | <i>səcal<sup>y</sup>i-</i>      | ‘very’  |
|     | <i>səcal<sup>y</sup>i-kəḱi</i>  | ‘very narrow’, cf. <i>kəḱi</i> ‘narrow’                           |
|     | <i>səcal<sup>y</sup>i-kaḱa</i>  | ‘very wide, very tall’, cf. <i>kaḱa</i> ‘wide, tall’              |
| (4) | <i>ca-</i>                      | ‘more than’   |
|     | <i>ca-kaḱa</i>                  | ‘taller, wider’, cf. <i>kaḱa</i> ‘wide, tall’                     |
|     | <i>ca-vuluŋ</i>                 | ‘older’, cf. <i>vuluŋ</i> ‘old man’                               |
|     | <i>ca-talad</i>                 | ‘deeper’, cf. <i>talad</i> ‘deep’                                 |

## 5. Yami

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Anne West</i>
---

---

---

### 1. Introduction

---

Yami is spoken by an estimated 2600 people on Orchid Island, also known as Lan Yu (Lanyu<sup>1</sup>), Taiwan (Formosa). It is spoken in six villages as follows:

1. Iraralay
2. Yayu
3. Iranomilek
4. Iratay
5. Imorod
6. Ivalino

Yami, along with the other Batanic languages, reveals similarities to and differences from the Austronesian languages of Taiwan and/or the Philippines. It is generally agreed that the Batanic languages belong to the Philippines group of languages. However, their position in respect to the three major Philippine language groups has not yet been determined. Tsuchida (1987: 3) considers that this group of languages seems to constitute a missing link which connects the languages of Taiwan and those of Luzon. [Earlier studies include Scheerer (1908); Asai (1936); and Tsuchida (1977).]

There is considerable variation in both phonology and morphology from village to village and from speaker to speaker. The wordlist presented in this volume comes from the village of Iratay, and from Iraralay, one of the least sophisticated Yami villages.

---

### 2. Phonology

---

The principal phonological features of the Iraralay dialect of Yami are as follows:

- 
1. Also known as Botel Tabago, Botel Tobago.
-

Continuants	vl		<i>ʃ</i>			<i>ʁ</i>
	vd	<i>v</i>	<i>ʒ</i>			
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Trills			<i>r</i>			
Semivowels		<i>w</i>		<i>y</i>		

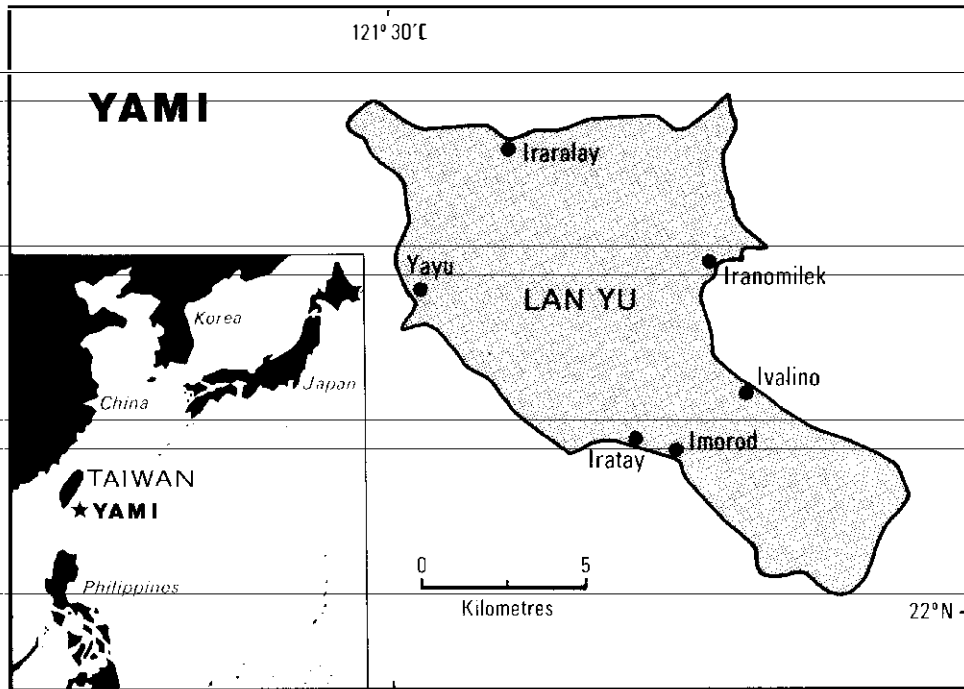

## Notes:

- /ç/ and /ǰ/ are palatal affricates.
- /d/ is a voiced retroflex stop
- /ʃ/ is a voiceless palatal fricative when followed by /i/, and a voiceless retroflex fricative [ʂ] elsewhere.
- /ʁ/ is realised as the lengthening of /ə/ in syllable-final position, and as a voiced uvular or pharyngeal fricative [ʁ] elsewhere.
- /n/ is realised as a palatal nasal before /i/, and as a dental [n] elsewhere.
- /l/ is a voiced lateral fricative when preceded by /i/, and a plain lateral elsewhere.

*Table 2. Vowels*

	Front	Central	Back
High	<i>i</i>		<i>o</i>
Mid		<i>ɔ</i>	
Low		<i>a</i>	

- /o/ is realised as [u] or [o].
- a phonemically non-distinctive glottal stop and a stress occur before a pause.

Map 5. Yami language area

### 3. Yami morphophonemics

#### I. *maN-/paN-*

- A. *maŋ-* and *paŋ-* occur before a root beginning with a vowel.

<i>maŋazilaw</i>	'loving'
<i>maŋjilitan</i>	'jealous'
<i>maŋopšo</i>	'remove'

- B. *-ŋ* assimilates to the point of articulation and the initial consonant of the root is reduced before *č*, *p*, *t*, and *š*.

<i>čizəŋ, manizəŋ</i>	'say'
<i>pažəŋ, mamažəŋ</i>	'make'
<i>ša-zaŋ, mana-zaŋ</i>	'buy'
<i>toag, manoag</i>	'call'

- C. *man-* and *pan-* occur before roots beginning with *l*, *ŋ*, *z*, *w*, and *y*.

<i>kanlinas</i>	'clean'
<i>manlabibi</i>	'talk back'
<i>manzazalay</i>	'worship'
<i>manžazen</i>	'name'

<i>manzaet</i>	'make bad'
<i>manwawan</i>	'forget'
<i>manwotwan</i>	'eat lunch'
<i>manyapyap</i>	'get fish'
<i>maniven</i>	'eat supper'

- D. Either *man-* or *maŋ-* and *paN-* or *paŋN-* with *N* assimilated to the point of articulation can occur before *b*, *ɟ*, *g*, *k*, *m*, *n* and *r*. Some words consistently occur with one form or the other, but with some words the form chosen varies with the speaker.

<i>manobo</i>	'bury'
<i>manbakbak</i> ~ <i>mambakbak</i>	'hit'
<i>mamotbot</i> ( <i>botbot</i> )	'pull up'
<i>manokɟok</i> ( <i>ɟokɟok</i> )	'knock out wall'
<i>mandəkət</i>	'stick on'
<i>manəŋɟəŋ</i>	'cook'
<i>maŋətgət</i> ( <i>gətgət</i> )	'wash hair'
<i>man gəgəy</i>	'slice'
<i>maŋolgol</i> ( <i>golgol</i> )	'cut hair'
<i>maŋaiɟ</i> ( <i>kaiɟ</i> )	'pull out'
<i>maŋalat</i> ( <i>kalat</i> )	'climb'
<i>mankatə</i> ~ <i>maŋatə</i>	'itch'
<i>manmama</i> ~ <i>mamama</i>	'raw'
<i>maŋnanaw</i>	'teach'
<i>manonoy</i> ( <i>nonoy</i> )	'drag fish line'
<i>manayin</i> ( <i>-rain</i> )	'clean fish'
<i>manzakat</i>	'kill'

- D. Either *man-* or *mam-* and *pan-* or *pam-* occur with roots beginning with *v*.

<i>manvoyaw</i>	'chase away'
<i>manviəy</i>	'make live'
<i>mamaray</i> ( <i>varay</i> )	'entertain a baby'
<i>matokod</i> ( <i>voɟod</i> )	'borrow'

## II. Vowel reduction

### A. When a suffix is added:

1. When a word ends in *y* or *i* and an *-ən* or *-an* suffix is added, the vowel of the suffix is dropped. The *-an* suffix is retained, however, when it occurs in the combination of *ka-* *-an*, making a derived form:

<i>ovay</i> + <i>-ən</i>	=	<i>ovain</i>	'until'
<i>tizay</i> + <i>-ən</i>	=	<i>tizain</i>	'dry'
<i>paṅay</i> + <i>-an</i>	=	<i>paṅayin</i>	'put'
<i>zatay</i>	'plain, smooth'	<i>kazatayan</i>	'a plain or field'
<i>aḍəy</i>	'lightning'	<i>nikaḍəyan</i>	'struck by lightning'

Exceptions:

<i>aziazian</i>	'cut hair'
<i>lagolagovin</i>	'care for' <i>lagolagoviən</i> 'care for someone'

2. When an *-an* suffix is added to a word ending in *-a*, one *a* is dropped.

<i>moa</i>	'to plant'	<i>pimoan</i>	'place to plant'
<i>zoa</i>	'two'	<i>pizoan</i>	'repeat'

### B. With a prefix:

1. When a prefix ending in *-a* is added to a word beginning with an *a-*, one /a/ is dropped:

<i>azo</i>	'many'	+	<i>mipa-</i>	>	<i>mipazo</i>	'increase'
<i>alit</i>	'exchange'	+	<i>ipa-</i>	>	<i>ipalit</i>	'exchange it'

2. A final *a* of a prefix plus a word initial *i* become *məy-* or *may-*, depending on the village:

<i>iṅən</i>	'sickness'	+	<i>ma-</i>	=	<i>məyṅən</i>	'sick'
<i>iliḍ</i>	'narrow'	+	<i>ma-</i>	=	<i>məliḍ</i>	'to be narrow'

3. If a prefix ending in *a* is added to a word beginning with *ə* or *o*, either the *a* of the prefix is dropped or becomes the same as the root vowel with the root vowel then changing to the corresponding semi vowel. Which option is chosen depends on the village.

<i>ma</i>	+	<i>əməṣ</i>	=	<i>məyməs/məməṣ</i>	'drown'
<i>ma</i>	+	<i>ogto</i>	=	<i>mowgto/mogto</i>	'surprised'
<i>ma</i>	+	<i>omaṅ</i>	=	<i>mowmaṅ/momaṅ</i>	'tired of a food'

4. Occasionally the root initial *a* is dropped following a prefix ending in *-i*.

<i>api-</i>	+	<i>aṣa</i>	'one'	+	<i>-an</i>	=	<i>apiṣan</i>	'the next time'
-------------	---	------------	-------	---	------------	---	---------------	-----------------

It is more common to retain it, however:

<i>mi-</i>	+	<i>anak</i>	'child'	=	<i>mianak</i>	'have a child'
<i>mi-</i>	+	<i>anwanokod</i>	'song'	=	<i>mianwanokod</i>	'sing'

### III. Loss of vowels in root words.

All vowels but *i* can be dropped when they occur in unstressed syllables and when this would not result in a cluster of more than two consonants.

#### a. Examples of loss of ə:

<i>atəp</i>	'roof'	<i>niatpanan</i>	'roofed'
<i>parəŋ</i>	'make'	<i>paŋŋən</i>	'make something'
<i>vatək</i>	'design'	<i>vatkan</i>	'make design on'

#### b. Examples of loss of a:

<i>maɖagɖag</i>	'morning'	<i>nimɖagɖag</i>	'this morning'
<i>akɖot</i>	'pinch'	<i>maŋɖot</i>	'pinching'

#### c. Examples of loss of o:.

<i>noma</i>	'first'	<i>nipanman</i>	'the first'
<i>tokoɖ</i>		<i>tokɖən</i>	'reach'

#### d. The word for 'hear/listen' is pronounced by some speakers as *mamiŋəŋ* 'hear' and *amiŋŋən* 'listen', but by others as *mamiŋiŋ* in which case the *-i-* is retained in the suffixed form *amiŋiŋən*.

## 6. Isnag

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Rodolfo R. Barlaan</i>
--

---

---

### 1. Introduction

---

---

The Isnag language belongs to the Austronesian (Malayo-Polynesian) language family. Both Dyen (1965: 31) and Walton (1979) assign Isnag to the northern Cordilleran group in the northern Philippines. The language is spoken by approximately 27,000 people in the northern part of the province of Kalinga-Apayao.

There are different dialects of the Isnag (sometimes wrongly written as Isneg) language. In his *Isnag-English vocabulary*, Vanoverbergh (1972: 6) classified the dialects into two basic groups, the Oʔ and Bo dialects, depending upon which of the two words which mean 'yes' the language group uses.

The Bo dialect is mainly spoken in the villages of Lenneng, Karagawan, and Dagara, all of which are in the district of Kabugao, and in the district of Conner.

The Oʔ dialect, spoken in the other villages, is further classified into four sub-dialects based on some phonetic variations involving the back velars /k/ and /g/ and the glottal stop /ʔ/ and glottal fricative /h/.

The first sub-dialect of the Oʔ dialect, which I will call sub-dialect A, is spoken in the areas on the tributaries of the Apayao river north of Kabugao, particularly in Lako and Baliwanan. This dialect is characterised by the dominant use of the glottal fricative /h/ instead of the voiced back velar /g/ intervocalically, and the use of the glottal stop /ʔ/ instead of the voiceless back velar /k/.

The second sub-dialect, B, is spoken in some villages near Kabugao centre and in villages above Kabugao. This dialect is characterised by the preponderant use of /k/ instead of /ʔ/ and the use of /h/ instead of /g/ intervocalically.

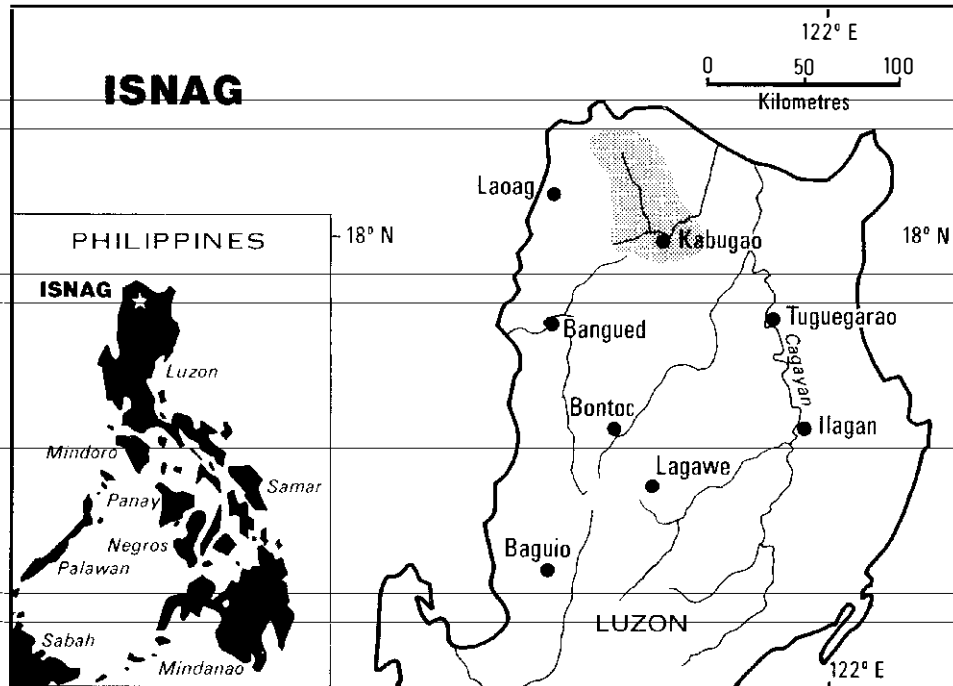

The third sub-dialect, C, is spoken in villages surrounding Namaltugan (also called Abbil). This dialect is characterised by the use of /g/ instead of /h/ intervocalically. The glottal stop is more used than /k/.

---

---

The fourth sub-dialect, D, is primarily spoken in Calanasan and the surrounding villages. This dialect is characterised by the use of /k/ instead of /g/ and the use of /h/ instead of /k/.

Map 6. Isnag language area

The phonetic characteristics of these four sub-dialects are illustrated by the following examples from Vanoverbergh's *Isnag-English vocabulary*.

Examples:	A	B	C	D
fingernail	<i>u<sup>?</sup>u</i>	<i>kuku</i>	<i>u<sup>?</sup>u</i>	<i>huhu</i>
mosquito	<i>ahu<sup>?</sup>up</i>	<i>ahukup</i>	<i>agu<sup>?</sup>up</i>	<i>aguhup</i>
to bear fruit	<i>magbisi</i>	<i>magbisi</i>	<i>magbisi</i>	<i>makbisi</i>
to lie down	<i>mahidda</i>	<i>mahidda</i>	<i>magidda</i>	<i>magidda</i>

The words in the Isnag wordlist were taken from dialect-B, specifically from the village of Dibagat which is above Kabugao.

## 2. Transcription of the wordlist

The phonemic transcription used in the wordlist is based on the standardised spelling proposed by Roe (1966: 66-71) to accommodate the phonetic

variation mentioned above. The letter *g* represents the sounds [g] or [h] depending upon whether the sub-dialect is A, B, C, or D, (e.g. *agukup* ‘mosquito’ [ahu<sup>2</sup>up], [ahukup] or [agu<sup>2</sup>up], [aguhup]). It also represents the sound [k] as in the word which means ‘deer’ which is pronounced [ugta] in sub-dialect B but [ukta] in dialect D.

### 3. Summary of the phonology

The following is a brief summary of the Isnag phonology.

#### 3.1 The syllable

There are two syllable patterns in Isnag: (C)V and (C)VC.

#### 3.2 Word stress

On the word level, stress is predictable. When long vowels including *e* and *o* which are always stressed are absent, the stress falls on the ultimate syllable.

#### 3.3 Length

Length is contrastive in Isnag. Except for /e/ and /o/, all phonemes have their corresponding long forms. Long vowels are interpreted as one segment while long consonants are interpreted as geminate clusters.

#### 3.4 Consonants

There are 15 consonant phonemes in Isnag.

*Table 1.* Isnag consonants

		Labial	Alveolar	Velar	Glottal
Stops	vl.	<i>p</i>	<i>t</i>	<i>k</i>	<i>ʔ</i>
	vd.	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives			<i>s</i>		
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Flaps			<i>r</i>		
Semivowels		<i>w</i>		<i>y</i>	

### 3.5 Vowels

Since long vowels are interpreted as single segments, an eight vowel system is proposed for Isnag.

*Table 2.* Isnag vowels

	Front		Central		Back	
	short	long	short	long	short	long
High	<i>i</i>	<i>ī</i>			<i>u</i>	<i>ū</i>
Mid	<i>e</i>				<i>o</i>	
Low			<i>a</i>	<i>ā</i>		

## 4. Morphophonemic processes in Isnag

The primary morphophonemic processes observed in Isnag are: deletion, assimilation, coalescence, epenthesis, and substitution.

### 4.1 Deletion

The phonemic units affected by deletion are: segments and length. The segments commonly deleted are the elements of the  $V_1C_2$  sequence. In a few cases,  $C_3V_2$  deletion has been observed, especially when  $V_1C_2$  deletion would result in a CCC cluster.

#### 4.1.2 $V_1C_2$ deletion

When a root with /a/ as the first vowel followed by a geminate cluster is affixed with either a prefix or an infix the  $V_1C_2$  is deleted. The infix is always inserted after  $C_1$ .

Example:

*kattab* 'to strike with a knife'  
*kattab* + *-um* → *kumtab* 'will strike with a knife'

<i>batta</i>	‘to cross a river’
<i>aki- + batta</i> → <i>akibta</i>	‘manner of asking somebody to take somebody across the river’

### 4.1.3 C<sub>3</sub>V<sub>2</sub> deletion

If a CCC cluster would result from the application of V<sub>1</sub>C<sub>2</sub> deletion, C<sub>3</sub>V<sub>2</sub> deletion applies instead.

Example:

<i>rabbay</i>	‘right to something’
<i>pag- + rabbay + -an</i> → <i>pagrabyan</i>	‘has rights to something’

### 4.1.4 V<sub>2</sub> deletion

When roots with a CV.CVC syllable pattern and with short final vowels are suffixed with *-an* or *ka-...-ān*, the final vowel is deleted.

Examples:

<i>lukat</i> ‘open’	
<i>lukat + -an</i> → <i>luktan</i>	(V <sub>2</sub> deletion)
	→ <i>luʔtan</i> (substitution, see 4.6)

<i>pakat</i> ‘coconut milk’	
<i>pakat + -an</i> → <i>paktan</i>	(V <sub>2</sub> deletion)
	→ <i>paʔtan</i> (substitution)

<i>sīkal</i> ‘reed’	
<i>sīkal + ka-...-ān</i> → <i>kasīklān</i>	(V <sub>2</sub> deletion)
	→ <i>kasīklān</i> (vowel shortening, see 4.1.5)

### 4.1.5 Length deletion (vowel shortening)

When two long vowels occur in adjacent syllables after affixation, the first vowel is shortened.

Examples:

<i>kattāt</i> ‘suddenness’	
<i>kattāt + -in-...-ān</i> → <i>kintatān</i>	‘something done with suddenness’

Examples:

<i>unāt</i>	‘sugarcane’	<i>ka-...-ān</i>	‘place of...’
<i>unāt + ka-...-ān</i>		→ <i>konatān</i>	‘sugarcane plantation’
<i>iyug</i>	‘coconut’		
<i>iyug + ka-...-ān</i>		→ <i>keyugān</i>	‘coconut plantation’

#### 4.4 Final consonant gemination

When roots with a short vowel in the final syllable are affixed with *-an* or *-ān* the final consonant geminates.

Examples:

<i>illag</i>	‘clean container of its content’		
<i>illag + -an</i>		→ <i>illaggan</i>	‘to clean a container of its content’
<i>bula?</i>	‘peel, skin’		
<i>bula? + -an</i>		→ <i>bulaʔʔan</i>	‘to remove the peeling/skin’
<i>talab</i>	‘half-split bamboo’		
<i>talab + -an</i>		→ <i>talabban</i>	‘to put walls of half-split bamboos’

#### 4.5 Glottal epenthesis

When roots ending in /a/ are suffixed with *-an* a glottal stop is inserted between the two /a/ vowels.

Examples:

<i>kuwa</i>	‘do’		
<i>kuwa + -an</i>		→ <i>kuwaʔan</i>	‘to do the work’
<i>bumba</i>	‘pump’		
<i>bumba + -an</i>		→ <i>bumbaʔan</i>	‘to pump water from the well’
<i>kanna</i>	‘hit’		
<i>kannaʔan</i>		→	‘to hit the target’

#### 4.6 Substitution

When /t/ or /k/ occurs before another consonant after a morphophonemic process is applied to the affixed word the /t/ or the /k/ is replaced by the glottal stop.

Examples:

<i>gitap</i>	‘door’		<i>-an</i>	‘goal focus, non-past’
<i>gitap</i> + <i>-an</i>		→	<i>gitpan</i>	(V <sub>2</sub> deletion)
			→ <i>giʔpan</i>	‘to close a door’
<i>putad</i>	‘cut off a piece’			
<i>putad</i> + <i>-an</i>		→	<i>putdan</i>	(V <sub>2</sub> deletion)
			→ <i>puʔdan</i>	‘to cut off a piece from something’
<i>sīkal</i>	‘reed’		<i>ka-...-ān</i>	‘place of...’
<i>sīkal</i> + <i>ka-...-ān</i>		→	<i>kasiklān</i>	(V <sub>2</sub> deletion)
			→ <i>kasiʔlān</i>	‘where reeds grow’

## 7. Kalinga (Linimos)

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Hartmut Wiens</i>
--

---

---

### 1. Introduction

---

Kalinga is an Austronesian language spoken in the subprovince of Kalinga Apayao which is located in the Cordillera Central mountains of Luzon in the Philippines. Thomas and Gieser (1973) place Kalinga in the Central Cordilleran group of Philippine languages along with Ilocano, Itneg, Bontoc, Kankanay, Ifugao, Inibaloi and Isinai. Kalinga is spoken by an estimated seventy to eighty thousand people. The best known works on the Kalinga to date are ethnographies by F.R. Barton (1949) and Edward P. Dozier (1966). Various linguistic studies have been published by Lawrence A Reid (1974), C. Richard Gieser (1958, 1972a, 1972b), Bruce Grayden (1976), Sherri Brainard (1983) and Neville Thomas (1978).

There are numerous dialects of Kalinga. In depth linguistic research is being conducted and separate bodies of literature have been produced in five of these dialects. The particular dialect reflected in this wordlist is referred to by its speakers as Linimos and is spoken by about 8,000 people living along the lower Saltan river in the municipality of Pinukpuk.

The data for this wordlist were recorded by the author during five years of residence 1974-1980 in the village of Asibanglan in the municipality of Pinukpuk.<sup>1</sup>

- 
1. This field work was conducted under the auspices of the Summer Institute of Linguistics under the terms of an agreement with the Philippine Department of Education, Culture and Sports. The generosity and hospitality of the Filipino people which have made it possible for my family and me to live and work in the Philippines must be acknowledged. We especially wish to express our gratitude to our many Kalinga friends who helped fill our years of residence among them with some of our richest memories. My friends Pedro Agustin, Benito Aggueban and Luis Balutoc deserve special mention for the many hours they spent helping me learn their language and compile the vocabulary for this wordlist.

-

## 2. Summary of the phonology

Below is a brief overview of the phonology of Kalinga (Linimos). Additional discussion of the phonology and grammar may be found in several published articles by the author.

### 2.1 The syllable

The two syllable patterns found in Kalinga (Linimos) are CV and CVC.

Map 7. Kalinga (Linimos) language area

### 2.2 Inventory of consonants

Kalinga (Linimos) has 14 consonant phonemes.

	Bilabial	Alveolar	Velar	Glottal
Stops	vl vd	p b	t d	k g
Ericsives		s		
Nasals		m	n	ŋ
Laterals			l	
Semivowels		w	y	

### 2.2.1 Discussion

The lateral /l/ displays considerable allophony, both within and between dialects. This variation remains in need of further investigation (Gieser 1958, Wiens 1976a, Grayden 1976, Thomas 1978).

A more complete discussion of Kalinga (Linimos) consonants can be found in Wiens (1976b).

### 2.3 Inventory of vowels

Kalinga (Linimos) has five vowel phonemes:

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

#### 2.3.1 Discussion

There are of course allophonic variations of these vowel phonemes. Perhaps, the greatest variation occurs in the central and back vowels. The vowels *a*, *o* and *u* are drawn forward in the mouth when they precede the lateral [l] in closed syllables. The vowel *a* moves from central unrounded [a] to front unrounded [æ], *o* moves from back rounded [o] to central rounded [ö], and *u* moves from back rounded [u] to central rounded [ü]. A more complete discussion can be found in Wiens (1976b).

Vowel length is also shown in the word list. However, this is not phonemic, but related to stress. Where stress falls on a penultimate open syllable, the vowel is automatically long, e.g. 'lubuŋ' 'world' has a long vowel in its first syllable: *lūbuŋ*. Where vowel length is not shown, the stress falls on the final syllable and lengthening does not occur.

### 2.4 Morphophonemics

Kalinga, like other Cordilleran languages in the Philippines, is rich in morphophonemic alternations. Morphophonemic alternation is especially prevalent in verbal constructions with the result that it is often difficult to

isolate the root after the operation of various morphophonemic processes. Here I will illustrate only a sampling of these. Further elaboration can be found in Gieser (1970) and Wiens (1976b)

### 2.4.1 Assimilation

One common form of assimilation occurs with the verb prefix *man-*. Before bilabial and velar consonants the affix final *n* assimilates to the point of articulation of the following consonant to become *m* or *ŋ*. Before *l* and *w* the affix final *n* completely assimilates to become *l* and *w*.

Examples:

<i>man-</i> + 'bawi	<i>mam'bawi</i>	'to build a shelter'
<i>man-</i> + ka'mos	<i>maŋka'mos</i>	'to mix'
<i>man-</i> + 'lati	<i>mal'lati</i>	'to rust'
<i>man-</i> + wi'tiwit	<i>mawwi'tiwit</i>	'to twist'

Another verbal prefix *maN-* exhibits internal fusing assimilation when attached to a root. The final consonant of the prefix becomes fused with the initial consonant of the root, retaining the nasality of the final consonant of the prefix and taking on the point of articulation of the initial consonant of the root.

Examples:

<i>maN-</i> + pe'nal	<i>mame'nal</i>	'to plant a seedbed'
<i>maN-</i> + ta'dok	<i>mana'dok</i>	'to dance'
<i>maN-</i> + 'kayu	<i>ma'ŋayu</i>	'to gather wood'

### 2.4.2 Vowel reduction

Another common form of assimilation is vowel reduction. The general principle seems to be that the vowels *o* and *u* are lost wherever, were they to remain, they would form the peak of an unstressed open syllable between two syllables. This can be illustrated with the root *lotop* 'dive', and *putod* 'cut'.

<i>lo'top</i> + -om	<i>lot'pom</i>	'you dive after it'
<i>lo'top</i> + -in-	<i>lin'top na</i>	'he dove after it'
<i>lo'top</i> + -um-	<i>lum'top ka</i>	'you dive'
<i>pu'tod</i> + -in-	<i>pin'tod na</i>	'he cut it'
<i>pu'tod</i> + na-	<i>nap'tod</i>	'it is cut in two'

### 2.4.3 Secondary alternation with vowel reduction

Vowel reduction frequently leads to internal assimilation in the consonants that are brought together as the result of the vowel loss.

Examples:

<i>pu'los</i> + <i>-in-</i>	<i>pi'l'los</i>	'took away'
<i>si'pit</i> + <i>-in-</i>	<i>sim'pit</i>	'stung'
<i>da'toŋ</i> + <i>-on</i>	<i>dak'ŋon</i>	'meet or come upon'

In a few cases vowel reduction also leads to metathesis of the consonants that are brought together as the result of the vowel loss.

Examples:

<i>so'gob</i> + <i>-on</i>	<i>sob'gon</i>	'to burn'
----------------------------	----------------	-----------

The above examples are merely illustrative of some of the morphophonemic alternation occurring in Kalinga (Linimos). Where the results of morphophonemic alternation would make it difficult to identify the root word in the comparative lexicon the words are segmented into their roots and affixes.

## 8. Tagalog

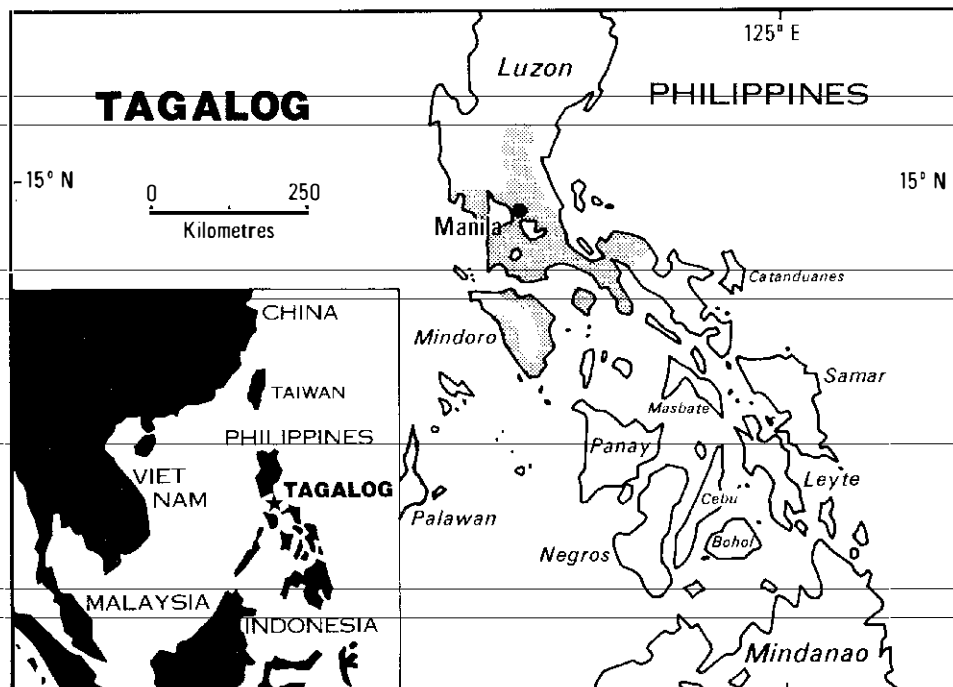

**Contributor:**

Introduction and Wordlist: *R. David Zorc*

### 1. Introduction

Tagalog is the major language of the southern part of the island of Luzon in the Philippines and has in excess of 14,500,000 speakers. The language and its speakers are said to be named *river folk* [*tága-* 'place of origin' + *ilog* 'river'].

As early as 1897 Tagalog was proposed as the National Language, due to the large number of speakers, a reasonably rich collection of native literature, and the fact that propaganda for the revolution against Spain and America was written in the language. In 1939, Tagalog was chosen as the basis for *Pilipino* (the official name for the national language). In 1973, the official language was re-christened *Filipino*, but was still to be based on Tagalog, incorporating a wider variety of its lexicon from other Philippine languages. Regardless of recurring opposition, some form of Tagalog is now spoken or understood by almost 70% of the Philippine population, the cumulative result

Map 8. Tagalog language area

of bilingual education, movies, comics, and news media (see Gonzalez 1980).

During the 1940s a period of purism set in with regard to the construction of Pilipino. Members of the Institute of National Language were prolific in their coinages such as *salumpuwít* 'seat' and *banyúhay* 'metamorphosis', which were introduced to replace already assimilated loans *silya* 'chair' (Spanish) and *metamòrposís* (English). Some such terms introduced in textbooks have been accepted and are in use. Recent trends have again been recognising Tagalog as the *koine* it is; Spanish, English, and numerous loans from other Philippine languages are freely being incorporated into Filipino.

Tagalogs have migrated throughout the archipelago (e.g. throughout the islands of Mindoro and Palawan, and cities like Cebu, Davao and Cotabato) in search of trade or employment, and there are large enclaves in the USA, especially in San Francisco and New York.

The dialect reported here is that of Manila, the capital of the nation as well as its commercial centre. Other dialects are associated with the provinces of Batangas, Quezon, Marinduque, etc. Some are quite divergent lexically, although all are mutually intelligible with the rest.

The closest relatives of Tagalog are the Bisayan (Visayan) and Bikol subgroups of Central Philippine languages (see Zorc 1977: 223-240).

Major sources for Tagalog include: Bloomfield (1917), De Guzman (1978), English (1977, 1986), Panganiban (1972), Santos (1983) and Wolfenden (1961).

## 2. Phonology

The following is a brief summary of Tagalog phonology. Additional discussion can be found in Schachter and Otones (1972: 1-30).

*Table 1. Consonants*

		Bilabial	Alveolar	Alveo- palatal	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	( <i>ç</i> )	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>	( <i>j</i> )	<i>g</i>	
Fricatives		( <i>f</i> )	<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Trills			<i>r</i>			
Continuants		<i>w</i>	<i>y</i>			

Although *r* has phonemic status due to loan words, it is also the intervocalic allophone of *d*. Items in parentheses have a very low frequency and are generally the result of the adoption of loanwords from Spanish or English. Whether a sound is native or inherited can be seen in reduplications, e.g. *nag-Øi'Øes* 'is playing chess' [vs *nag-ti-Øes*] or *nag-ji-'jip* 'always rides a jeepney' [vs *nag-di-'jip*].

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Vowel length is phonemic and therefore differentiates root words:

<i>'bāga?</i>	'lungs'	<i>ba'ga?</i>	'abscess, boil'
<i>'hāpon</i>	'afternoon	<i>ha'pon</i>	'Japan(ese)'

Stress is a feature of penultimate vowel length (vs shortness) and of syllable shape. Long vowels can only occur in an open syllable. If, for example, the penult vowel is long, that syllable is accented, e.g. [tūbo] 'pipe, tube'. If the penultimate syllable is open and short, accent falls on the ultima, e.g. [tu'bo] 'sugarcane'. If the penult consists of a closed syllable, i.e. CVC, accent falls on the ultima, e.g. [tug'tog] 'play (a musical instrument)'.

Basic syllable shape is CV(C). There are no vowel initial syllables; a word spelled as beginning with a vowel actually begins with the glottal stop. Some sample types include:

CV	<i>sa</i>	[locative marker]
CVC	<i>may</i>	'there is' [existential marker]
CV.CV	<i>ma'ta</i>	'eye'
CV.CVC	<i>ta'lon</i>	'waterfall'
CVC.CV	<i>bag'yo</i>	'storm, typhoon'
CVC.CVC	<i>bag'sak</i>	'fall (of something heavy)'

### 3. Morphophonemic changes

1. NG assimilation. The morphophoneme NG assimilates to the point of articulation of the first consonant of the root:

<i>siNG-</i> + <i>bi'lis</i>	<i>simbi'lis</i>	'as fast as'
<i>paNG-</i> + <i>bāta?</i>	<i>pambāta?</i>	'for children'
<i>saNG-</i> + <i>da'li?</i>	<i>sanda'li?</i>	'just a moment'

2. N change. This morphophoneme assimilates to the point of articulation of the first consonant of the root, which is subsequently lost:

<i>maN-</i> + <i>pīli</i>	<i>mamīli?</i>	'choose, select'
<i>paN-</i> + <i>bāhaw</i>	<i>pamāhaw</i>	'eat breakfast'
<i>naN-</i> + <i>'da?ig</i>	<i>nana?ig</i>	'won, prevailed'
<i>paN-</i> + <i>tālo</i>	<i>panālo</i>	'victory'
<i>paN-</i> + <i>simbah</i>	<i>panimbah</i>	'worship'
<i>paN-</i> + <i>kāhoy</i>	<i>paṅāhoy</i>	'gather wood'
<i>paN-</i> + <i>?isda?</i>	<i>paṅisda?</i>	'go fishing'

3. Vowel loss occurs with several roots with closed final syllables when suffixation takes place:

<i>bigay</i>	<i>-an</i>	<i>bigyan</i>	'be given to'
<i>bukas</i>	<i>-an</i>	<i>buksan</i>	'be opened'
<i>ga'wa</i>	<i>-in</i>	<i>gawin</i>	'be made'
<i>lagay</i>	<i>-an</i>	<i>lagyan</i>	'be put upon'
<i>masid</i>	<i>CinV--an</i>	<i>minamasdan</i>	'are being observed'
<i>sunod</i>	<i>-an</i>	<i>sundan</i>	'be followed'
<i>sakay</i>	<i>-an</i>	<i>sakyan</i>	'be ridden'
<i>sakit</i>	<i>na--an</i>	<i>nasaktan</i>	'was injured'

4. H insertion occurs on most root words that end in a vowel when suffixation takes place; before the suffix is added *h* is inserted.

<i>tubu</i>	<i>-an</i>	<i>tubuhan</i>	'sugarcane farm'
<i>sūso</i>	<i>pa--in</i>	<i>pasusūhin</i>	'be breastfed!'
<i>bili</i>	<i>-in</i>	<i>bilhin</i>	'be bought'
<i>dala</i>	<i>-in</i>	<i>dalhin</i>	'be brought'
<i>sara</i>	<i>-an</i>	<i>sarhan</i>	'be closed'

5. R changes. A *d* becomes *r* when intervocalic after affixation takes place:

<i>dāgat</i>	<i>ka--an</i>	<i>karagātan</i>	‘ocean, deep-sea’
<i>tāwad</i>	<i>-an</i>	<i>tawāran</i>	‘be discounted!’

6. N addition. In a few roots, an *n* is inserted before a suffix:

<i>kuha?</i>	<i>-in</i>	<i>kūnin</i>	‘be taken!’
<i>tāwa</i>	<i>-an</i>	<i>tawānan</i>	‘be laughed at!’

Reduplication involves either the prefixation of the first consonant and first vowel to the root word (CV-) or the full reduplication of the root (R2). The former indicates ongoing or repetitive activity (as in the formation of the future or progressive tenses) while the latter (especially with the ligature *na* or *ŋ*) marks some form of intensification or emphasis:

<i>bili</i>		‘buy’
<i>ma-</i>	<i>mabi’li</i>	‘can be bought’
<i>maCV-</i>	<i>mabibili</i>	‘may always be bought’
<i>R2</i>	<i>mabi’liŋ-bi’li</i>	‘very popular’

#### 4. Verb morphology

Tagalog verbs are conjugated for one of four voices depending on the focus or agreement of the verb with the semantic role of the topic.

Active emphasises an actor (*datiŋ* ‘arrive’) or a meteorological event (*ulan* ‘rain’)

Passive emphasises an object affected or taken in (*bili* ‘buy’, *kā’in* ‘eat’, *patay* ‘kill’)

Instrumental emphasises an object moving away or parted with (*pag-bili* ‘sell’, *libiŋ* ‘bury’, *tāpon* ‘throw away’)

Local emphasises an object partially affected, cleansed, or removed (*hūgas* ‘rinse’, *laba* ‘launder’, *bāyad* ‘pay’, *tāwad* ‘discount’)

All verbs are inflected for four tenses. However, in the active voice, verbs fall into one of two classes: *-um-* (denoting intransitive or punctual actions amongst others) vs *mag-* (denoting transitive, durative, or reciprocal actions, amongst others, see Pittman (1966) or McFarland (1976)). The forms are as follows:

Active	Past	Progres.	Contingent	Future
-um- verb	-um-	Cum V-	-um-	CV-
mag- verb	nag-	nagCV-	mag-	magCV-

Following upon the identification of the appropriate active voice affix class, a verb may emphasise its object with any one of three passive forms:

Passive -um-

Direct pass.	-in-	Cin V-	-in	CV--in
Instrumental	i-in-	iCin V-	i-	iCV-
Local	-in--an	Cin V--an	-an	CV--an
Passive mag-	pinag-	pinagCV-	pag--in	pagCV--in
Direct pass.	ipinag-	ipinagCV-	ipag-	ipagCV-
Local	pinag--an	pinagCV--an	pag--an	pagCV--an

Additionally, nouns or adjectives can be used as stative or affective verbs, such as *na-gu'tom* 'was hungry' or *ma-layu<sup>2</sup>-an* 'found (X to be too) far away':

Stative	na-	naCV-	ma-	maCV-
Affective	na--an	naCV--an	ma--an	maCV--an

## 9. Aklanon

---

---

**Contributor:**

Introduction and Wordlist : *R. David Zorc*

---

---

### 1. Introduction

---

---

Aklanon is the primary speech variety of the northwestern section of the island of Panay in the central Philippines and has in excess of 350,000 speakers. Both the language and its speakers are named after the Aklan [ʔakʎan] River that flows through the centre of the province of that name. People, culture and items associated with this river and region are appropriately called Aklanon [ʔakʎānun]; the language is called [ʔinakʎa'nun], i.e., with the *-in-* infix and accent shift, or more simply Bisaya [binisa'yaʔ], since Aklanons recognise their membership in the Visayan cultural and linguistic bloc.

Aklanons, especially professionals, have migrated to virtually all major Philippine centres (e.g. Manila, Cebu and Cotabato) in search of employment and there are even largish enclaves in San Francisco and New York.

The dialect reported here is that of Kalibo, Aklan, the capital of the province as well as its commercial centre. Other dialects are associated with the towns of Altavas, Batan, Balete, Banga, Madalag, New Washington, Numancia, Malinao, Lezo, Makato, Tangalan, Nabas, Ibahay, and Libakaw -- the latter two being quite divergent, although still mutually intelligible with the rest. Two other towns are located within the province of Aklan, but different dialects are spoken (Buruwanga is associated with Kinaray-a and Malay with various dialects of Tablas, Romblon).

The closest relatives of Aklanon are Kinaray-a and Kuyonon of the West Bisayan subgroup of Central Philippine languages (see Zorc 1972 and 1977: 16, 259-265).

---

---

### 2. Phonology

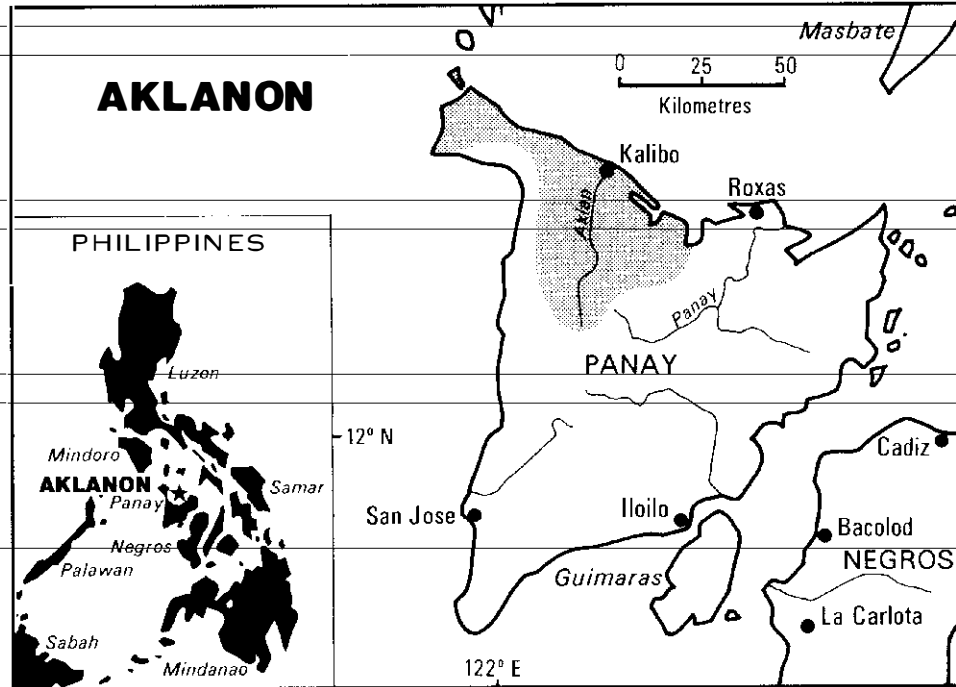

---

---

The following is a brief summary of Aklanon phonology. Additional discussion can be found in Zorc and de la Cruz (1968: 8-31).

---

---

Map 9. Aklanon language area

### Inventory of consonants

Aklanon has 17 inherited consonant phonemes. Speakers who are bilingual in English (or Spanish) have an additional four borrowed phonemes, put within parentheses below:

Table 1. Consonants

		Bilabial	Alveolar	Alveo-palatal	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	( <i>c</i> )	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>	( <i>ʃ</i> )	<i>g</i>	
Fricatives	vl	( <i>f</i> )	<i>s</i>			<i>h</i>
	vd	( <i>v</i> )				
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Trills			<i>r</i>			
Semivowels		<i>w</i>		<i>y</i>	<i>ɥ</i>	

Although *r* has phonemic status due to loan words, it is also an intervocalic allophone of *d*; similarly, *ʃ* alternates with *l* and with *d* (see morphophonemic changes below). Items in parentheses are of very low frequency and are generally the result of the adoption of loanwords from Spanish or English. Both *c* and *ɟ* can sometimes be heard as the result of coalescence with *y* across a syllable boundary, e.g. ['batyag] = ['bacag] 'feel, perceive' or ['budyon] = ['buɟon] 'conch, sea-shell trumpet'.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	( <i>e</i> )		( <i>o</i> )
Low		<i>a</i>	

Vowel length is phonemic and therefore differentiates root words:

<i>'bāgaʔ</i>	'lungs'	<i>ba'gaʔ</i>	'swollen'
<i>'hāpun</i>	'afternoon'	<i>ha'pun</i>	'Japan(ese)'
<i>'ʔitik</i>	'tickle'	<i>'ʔitik</i>	'duck'
<i>'sūʔud</i>	'fine tooth comb'	<i>su'ʔud</i>	'enter'

Stress is a feature of penultimate vowel length (vs shortness) and of syllable shape. Long vowels can only occur in an open penult. If the penult vowel is long, that syllable is accented, e.g. ['tūbo] 'pipe, tube'. If the penultimate syllable is open and short, accent falls on the ultima, e.g. [tu'boh] 'sugarcane'. If the penult consists of a closed syllable, i.e. CVC, accent falls on the penult, e.g. ['tuktuk] 'mince, chop into little pieces'.

Basic syllable shape is CV(C). There are no vowel initial syllables; a word spelled as beginning with a vowel actually begins with the glottal stop. Some sample types include:

CV	<i>sa</i>	[locative marker]
CVC	<i>may</i>	'there is' [existential marker]
CV.CV	<i>'ʔāgi</i>	'pass (by)'
CV.CVC	<i>bu'say</i>	'waterfall'
CVC.CV	<i>'ʔanyo</i>	'whose?'
CVC.CVC	<i>'tambuk</i>	'fat'

### 3. Morphophonemic changes

1. NG assimilation. The morphophoneme NG assimilates to the point of articulation of the first consonant of the root:

<i>saNG-</i> + <i>bātu</i>	<i>sambātu</i>	‘one (piece)’
<i>paNG-</i> + <i>dulsi</i>	<i>pandulsi</i>	‘dessert’
<i>kasiNG-</i> + <i>bug<sup>?</sup>at</i>	<i>kasimbug<sup>?</sup>at</i>	‘equally heavy’

2. N change. This morphophoneme assimilates to the point of articulation of the first consonant of the root, which is subsequently lost:

<i>paN-</i> + <i>pasyar</i>	<i>pamasyar</i>	‘roam around’
<i>paN-</i> + <i>bāhaw</i>	<i>pamāhaw</i>	‘eat breakfast’
<i>paN-</i> + <i>dāpat</i>	<i>panāpat</i>	‘use extensively’
<i>paN-</i> + <i>tābas</i>	<i>panābas</i>	‘tailoring’
<i>paN-</i> + <i>simbah</i>	<i>panimbah</i>	‘worship’
<i>paN-</i> + <i>dumdum</i>	<i>panumdum</i>	‘remember’
<i>paN-</i> + <i>kalisud</i>	<i>pangalisud</i>	‘suffer’
<i>paN-</i> + <i>ʔisda<sup>?</sup></i>	<i>pangisda<sup>?</sup></i>	‘go fishing’

3. Vowel loss occurs with several roots with closed final syllables when suffixation takes place.

<i>sakay</i>	<i>-an</i>	<i>sakyan</i>	‘will be ridden’
<i>patay</i>	<i>-un</i>	<i>patyun</i>	‘will be killed’
<i>sakit</i>	<i>na--an</i>	<i>nasaktan</i>	‘was injured’
<i>tawag</i>	<i>-un</i>	<i>tawgun</i>	‘will be called’
<i>lisud</i>	<i>na--an</i>	<i>nalisdan</i>	‘was encumbered’

4. Vowel change occurs when the vowel in the last syllable is open: *i* changes to *y*, *u* changes to *w*, but *a* is lost and a glottal stop is inserted:

<i>ʔāgi</i>	<i>gin--an</i>	<i>ginʔagyan</i>	‘was bypassed’
<i>ʔābi</i>	<i>-an</i>	<i>ʔabyan</i>	‘friend’
<i>tubu</i>	<i>ka--an</i>	<i>katubwan</i>	‘sugarcane farm’
<i>sūsu</i>	<i>pa--ah</i>	<i>pasuswah</i>	‘be breastfed’
<i>kutāna</i>	<i>-un</i>	<i>kutanʔun</i>	‘will be asked’
<i>taka</i>	<i>na--an</i>	<i>natakʔan</i>	‘was fed up with’

5. Metathesis occurs after vowel loss when *h* or *ʔ* would occur before another consonant, when *l* would occur before another apical consonant, or when *n* would occur before *m*:

<i>tahup</i>	<i>-ih</i>	<i>taphih</i>	‘winnow (it)!’
<i>gahum</i>	<i>-anan</i>	<i>gamhānan</i>	‘powerful’
<i>mūʔuk</i>	<i>ha--an</i>	<i>hamukʔan</i>	‘slept deeply’
<i>daʔug</i>	<i>-un</i>	<i>dagʔun</i>	‘will be defeated’
<i>suʔud</i>	<i>-un</i>	<i>sudlun</i>	‘enter (it)!’
<i>ʔinum</i>	<i>-ah</i>	<i>ʔimnah</i>	‘drink (it)!’
<i>tanum</i>	<i>-an</i>	<i>tamnan</i>	‘be planted in’

6. *ʔ* changes. The phoneme *ʔ* changes to *l* when in an environment with an apical consonant (*t*, *d*, *n*, or *s*) or with the vowel *i* (such as when the infix *-in-* is added):

<i>suʔud</i>	<i>ka--an</i>	<i>kasudlan</i>	‘entrails’
<i>puʔus</i>	<i>ka--anan</i>	<i>kapuslānan</i>	‘value, worth’
<i>duʔun</i>	<i>ha--an</i>	<i>hadunlan</i>	‘choked on food’
<i>kāʔut</i>	<i>-an</i>	<i>katlan</i>	‘itchy’
<i>ʔubung</i>	<i>-in-</i>	<i>linubung</i>	‘was buried’
<i>ʔāhaʔ</i>	<i>-in-</i>	<i>lināhaʔ</i>	‘was cooked’

*ʔ* changes to *d* when resyllabified from syllable initial position to syllable final position on some roots (which historically derive from a Proto-Bisayan \*d < PAN \*d, \*D, or \*Z):

<i>watʔaʔ</i>	<i>na--an</i>	<i>nawadʔan</i>	‘was left without’
<i>ʔāʔa</i>	<i>-in--an</i>	<i>linadʔan</i>	‘was in pain’
<i>muʔuʔ</i>	<i>na--an</i>	<i>namudʔan</i>	‘was noticed’
<i>pasipatʔa</i>	<i>-an</i>	<i>pasipadʔan</i>	‘will be cursed’

Contrast the following where *ʔ* remains:

<i>duʔum</i>	<i>kaCV--an</i>	<i>ka-du-duʔm-an</i>	‘darkness’
<i>satʔaʔ</i>	<i>ka--anan</i>	<i>kasatʔānan</i>	‘sin, sinfulness’

7. R changes. Final *r* in Spanish loanwords changes to *h* when suffixed:

<i>tukar</i>	<i>pa--ah</i>	<i>patukahah</i>	‘make play music’
<i>ʔandar</i>	<i>pa--un</i>	<i>paʔandahun</i>	‘run (a machine)’
<i>tumar</i>	<i>-ah</i>	<i>tumahah</i>	‘drink (medicine)’

After instances of vowel loss, *r* changes to *d*:

<i>kurut</i>	<i>-un</i>	<i>kudtun</i>	‘will be pinched’
<i>sarah</i>	<i>-ih</i>	<i>sadhih</i>	‘close (it)!’
<i>turus</i>	<i>-ah</i>	<i>tudsah</i>	‘squeeze (pimple)!’
<i>turuʔ</i>	<i>-an</i>	<i>tudʔan</i>	‘be taught!’

When *d* becomes intervocalic after affixation, it changes to *r*:

<i>bāyad</i>	<i>-an</i>	<i>bayāran</i>	‘will be paid’
<i>būkid</i>	<i>ka--an</i>	<i>kabukīran</i>	‘mountain range’
<i>sūgid</i>	<i>-i</i>	<i>sugīri</i>	‘be told’

8. Reduplication involves either the prefixation of the first consonant and first vowel to the root word (CV-) or the full reduplication of the root (R2). The former indicates repetitive activity while the latter marks diminution or artificiality:

<i>bakaʔ</i>		‘buy’
<i>ma-</i>	<i>mabakaʔ</i>	‘may be bought’
<i>maCV-</i>	<i>mababakaʔ</i>	‘may always be bought’
<i>R2</i>	<i>bakaʔ-bakaʔ</i>	‘pretend to buy, window shop’

#### 4. Verb morphology

Aklanon verbs are conjugated for one of four voices depending on the focus or agreement of the verb with the semantic role of the topic.

Active emphasises an actor (*adtu* ‘go’) or a meteorological event (*uʔan* ‘rain’)

Passive emphasises an object affected or taken in (*bakaʔ* ‘buy’, *kāʔun* ‘eat’, *patay* ‘kill’)

Instrumental emphasises an object moving away or parted with (*baligyaʔ* ‘sell’, *ʔubung* ‘bury’, *pilak* ‘throw away’)

Local emphasises an object partially affected, cleansed, or removed (*hūgas* ‘rinse’, *ʔabah* ‘launder’, *bāyad* ‘pay’, *tāwad* ‘discount’)

All verbs are inflected for six tenses (three of the key tenses are presented below):

	Inf	Past	Imp
Active	<i>mag-</i>	<i>nag-</i>	<i>pag-</i>
Passive	<i>-un</i>	<i>gina-</i>	<i>-a</i>
Instrumental	<i>i-</i>	<i>gina-</i>	<i>-ʔan</i>
Local	<i>-an</i>	<i>gina an</i>	<i>i</i>

In addition, nouns or adjectives can be used as stative or affective verbs, such as *na-guʔtom* ‘was hungry’ or *ma-tamʔis-ʔan* ‘found (something too) sweet’:

Stative	<i>ma-</i>	<i>na-</i>	<i>gi--a</i>
Affective	<i>ma--an</i>	<i>na--an</i>	<i>gi--i</i>

Complete information on any given root should include alternate root shapes (due to the operation of any of the morphophonemic changes discussed above). Thus,

<i>kāʔun</i>	‘eat’	<i>kanʔ-un</i>	‘be eaten’
<i>inum</i>	‘drink’	<i>imn-un</i>	‘be drunk’
<i>tukun</i>	‘swallow’	<i>tunl-un</i>	‘be swallowed’

## 5. Notes on the orthography

There is considerable confusion in the written work of Aklanons as to the spelling of *o* vs *u* [the former is, in most instances apart from loanwords, an allophone of the latter], but *u* is generally used throughout in inherited items occurring in the comparative lexicon.

In the traditional orthography, glottal stop is indicated by a hyphen when it occurs post-consonantly (e.g. *bug-at* ‘heavy’, *sin-o* ‘who?’, or *mag-abot* ‘to arrive’), and is sometimes marked by the same method after a vowel final prefix (e.g. *ma-abot* ‘will arrive’). In the data below, all occurrences *other than in initial position* are indicated by the appropriate linguistic symbol.

Aklanons spell the velar semivowel as ‘e’, but *ɣ* is used herein. In other central Philippine languages (like Tagalog, Hiligaynon or Cebuano) [l] is the cognate sound.

# 10. Palawan

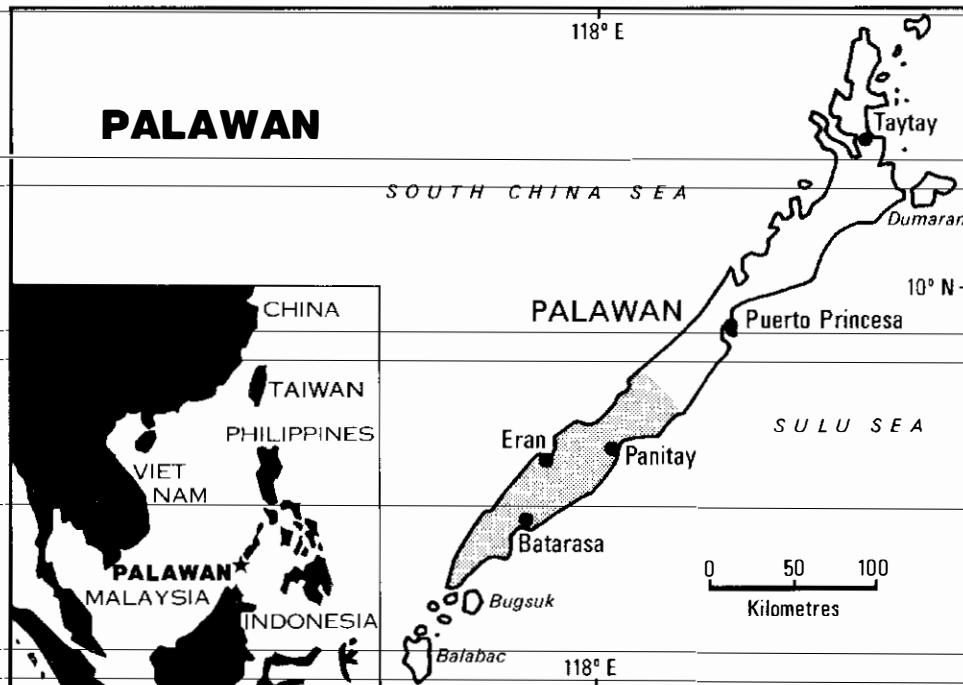

**Contributor:**

Introduction and Wordlist: *Nicole Revel*

## 1. Introduction

Palawan, also known as Palawanun, Pala-wan, Palawanən, Palaweño and Brooke's Point Palaweño, is spoken in central and southern Palawan, Philippines by a population of up to 50,000. The Palawan language is spoken in an area extending from the north of Abo-Abo to the islands of Pandanan, Bugsuk and Balabac in the south.

Palawan is a member of the Meso-Philippine subgroup (see Fig. 3). The Palawans were traditionally in regular communication with the Sulu Archipelago and with Borneo. Today the population has largely withdrawn to the interior of the island, on the slopes of the central mountain chain.

Map 10. Palawan language area

## 2. Phonology

The phonemes of Palawan are as follows:

### i) Consonants

There are seventeen consonants, thus:

	Bilabial	Apico-alveolar	Palatal	Velar	Glottal
Stops	vl.	<i>p</i>	<i>t</i>	<i>k</i>	ʔ
	vd.	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives		<i>s</i>			<i>h</i>
Nasals	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals		<i>l</i>			
Taps		<i>r</i>			
Semivowels	<i>w</i>	<i>y</i>			

### ii) Vowels:

There are four vowel phonemes defined by a front/back opposition and by an open/closed opposition, thus:

	Front	Back
Closed	<i>i</i>	<i>u</i>
Open	<i>a</i>	<i>ɔ</i>

The allophonic distribution of these phonemes is as follows:

/i/	–	[i ~ ɪ ~ e ~ ε]
/u/	–	[u ~ ʊ ~ ɔ]
/a/	–	[a]
/ɔ/	–	[ɔ ~ ɔ̃ ~ ɒ]

### iii) Phonological distribution: phonotactics.

- In word initial position:

- i. all four vowels occur.
- ii. all consonants except /h/ and /ʔ/. /ŋ/ is of very low frequency; /y/ and /w/ are also of low frequency.

- In medial position:

- i. all four vowels occur
- ii. all consonants occur; /ŋ/, /y/ and /w/ are of low frequency.

- Word finally:

- i. all four vowels occur
- ii. all consonants occur except /h/.

iv) Syllable structure and stress

Palawan syllables are of the form V, CV, VC, CVC. Stress falls on the penultimate syllable.

### 3. Morphosyntax

#### 1. Focus

There are five focuses in Palawan, as follows:

##### A. Agent focus:

1. <u>məglamu?</u>	<u>libunin</u>	ət	lugow	kət	məsakit	sət	apuy
make cook	woman that	the	rice soup	for	sick	on	fire
VP	NP		NP	NP			NP

##### B. Object focus:

2. <u>lalamu?ən</u>	ət	libun	<u>lugowin</u>	kət	məsakit	sət	apuy
will be cook	by	woman	rice soup that	for	sick	on	fire
VP		NP	NP	NP			NP

##### C. Attributive focus:

3. <u>lalamu?an</u>	ət	libunət	lugow	sət	apuy	<u>məsakitin</u>
will be cook	by	woman that	rice soup	on	fire	sick that
VP		NP	NP	NP		NP

##### D. Locative focus:

4. <u>lalamu?an</u>	ət	libun	ət	lugow	kət	məsakit	<u>apuyin</u>
will be cook	by	woman	that	rice soup	for	sick	fire that
VP		NP		NP	NP		NP

## E. Instrumental focus:

5. <i>ilalamu?</i>	<i>ət</i>	<i>libun</i>	<i>lugaw</i>	<i>kət</i>	<i>məsakit</i>	<i>apuyin</i>
will be cook	by	woman	rice soup	for	sick	fire that
VP		NP	NP		NP	NP

## 2. Derivational affixes

Palawan derivational affixes are as follows:

Affix combinations	Meaning/Function
<i>mɔg-</i> + B + <i>-an</i>	Completed action, collective or reciprocal (Agent focus)
<i>mɔg-</i> + Red.B + <i>-an</i>	Completed action, collective with notion of simulation/play (Agent focus)
<i>mɔg-</i> + <i>-in-</i> + B + <i>-an</i>	Completed action, high degree of intensity (Agent focus)
<i>pɔg-</i> + B	Direct action (Agent focus)
<i>pɔg-</i> + B + <i>-ɔn</i>	Direct action (Object-focus) Stimulating another person in an action (Object focus)
<i>pɔg-</i> + B + <i>-an</i>	Complete a process (Locative and attributive focus)
<i>-i</i> + <i>pɔg</i> + B	Complete a process (Instrumental focus)
<i>mɔg-</i> + <i>mɔ-</i> + B	Claim to be/do (Agent focus)
<i>mɔg-</i> + <i>mɔ-</i> + B + <i>-an</i>	Claim to be/do, collective action (Agent focus)
<i>mɔg-</i> + <i>pɔkɔ-</i> + B	Deliberate action (Agent focus)
<i>pɔkɔ-</i> + B + <i>-ɔn</i>	Carry out an action deliberately (Object focus)
<i>pɔkɔ-</i> + B + <i>-an</i>	Carry out a deliberate action for someone else (Attributive focus)

<i>i- + pəkɔ + B + -ɔn</i>	Carry out a deliberate action with something (Instrumental focus)
<i>pəg- + pəkɔ + B + -ɔn</i>	Make or transform an object intentionally (Object focus)
<i>pəg- + pəkɔ + B + -an</i>	Do intentionally (Attributive focus)
<i>məg- + pəki- + B</i>	Carry out a voluntary action (Agent focus)
<i>məg- + pəki- + B + -an</i>	Complete a voluntary and reciprocal action (Agent focus)
<i>i- + pəki- + B</i>	Carry out a continuous action (Instrumental focus)
<i>məg- + pəki- + pəg- + -an</i>	Harmonious action between partners (Agent focus)
<i>məgkɔ + B</i>	Do something; do something involuntarily (Agent focus)
<i>məgkɔ + B + -an</i>	Perform a reciprocal or collective action (Agent focus)
<i>pəgkɔ + B + -an</i>	Transform, cause to become (Locative focus)
<i>-i + pəgkɔ + B</i>	Transform into (Instrumental focus)
<i>i- + pəgkɔ + mɔ + B + -an</i>	Change state (Instrumental focus)
<i>pəkɔ + pəgkɔ + B + -an</i>	Idea of deliberate transformation (Locative focus)
<i>pɔʔin- + B</i>	Accuse falsely (Agent focus)
<i>pɔʔin- + B + -ɔn</i>	Accuse falsely (Object focus)
<i>pɔʔin- + B + -an</i>	Accuse falsely (Locative focus)
<i>i- + pɔʔin- + B</i>	Accuse falsely (Instrumental focus)
<i>məgsi- + B</i>	Carry out a collective action (Agent focus)
<i>məgsi- + B + -an</i>	Collective competition (Agent focus)
<i>məgsi- + pəg- + B</i>	Carry out a collective action (Agent focus)
<i>məgsi- + pəg- + B + -an</i>	Participate in a collective action, continue an action with a partner (Agent focus)

<i>mɔki-</i> + B	Ask permission (Agent focus)
<i>mɔki-</i> + <i>pɔg-</i> + B	Carry out an action with a partner (Agent focus)
<i>mɔki-</i> + <i>pɔg-</i> + B + <i>-an</i>	Participate in a collective action; continue an action begun with a partner (Agent focus)
<i>mɔkɔ-</i> + B	Abilitative (Agent focus)
<i>mɔkɔ-</i> + B + <i>-an</i>	Be capable of doing/performing an action on someone (Attributive focus)
<i>mɔkɔ-</i> + <i>pɔg-</i> + B	Be able to carry out an action (Agent focus)
<i>mɔkɔ-</i> + <i>pɔg-</i> + B + <i>-an</i>	Be able to perform a reciprocal action (Agent focus)
<i>mɔ-</i> + B + <i>-an</i>	Succeed in carrying out a process for someone (Attributive focus)
<i>mɔ-</i> + <i>mɔg-</i> + B	Plural of agents carrying out a process

### 3. Causatives

Affix combination	Meaning/Function
<i>pɔ-</i> + B	Causative, indirect action
<i>mɔg-</i> + <i>pɔ-</i> + B	Be the cause of a process, cause a state (Agent focus)
<i>pɔ-</i> + B + <i>-ɔn</i>	To have an action performed on someone; allow someone to perform an action (Object focus)
<i>pɔ-</i> + B + <i>-an</i>	To have an action performed on someone (Locative focus)
<i>i-</i> + <i>pɔ-</i> + B	Be the cause of a process; request a service of someone; seek permission to carry out an action (Instrumental focus)
<i>pɔ-</i> + <i>pɔ-</i> + B	To have permission to carry out an action (Agent focus)
<i>pɔ-</i> + <i>pɔkɔ-</i> + B + <i>-ɔn</i>	To be the cause of a feeling (Object focus)
<i>pɔ-</i> + <i>pɔkɔ-</i> + B + <i>-an</i>	To be the cause of a deliberate feeling (Attributive focus)

$pɔ- + pɔg- + B + -ɔn$	To be the cause of an action (Object focus)
$pɔ- + pɔg- + B + -an$	To be the cause of an action (Locative focus)
$pɔg- + pɔ- + B$	To prepare for an action
$pɔg- + pɔ- + B + -ɔn$	Have an action carried out on someone else (Attributive focus)
$pɔg- + pɔ- + B + -an$	Have an action carried out for someone else (Attributive focus); be the cause of an action (Locative focus)
$pɔ- + mɔ- + B$	Causative plural
$mɔ- + pɔ- + B$	Be able to set an action in train (Agent focus)
$mɔ- + pɔ- + B + -an$	Be able to carry out an action (Locative focus)
$mɔ- + pɔ- + pɔg- + B$	Have the possibility of having an action carried out
$mɔkɔ- + pɔ- + B$	Be able to be the cause of an action
$mɔkɔ+ pɔg- + pɔ- + B$	Be able to ask other people to carry out an action (Agent focus)
$mɔgkɔ- + pɔ- + B$	Ask others to carry out an action
$mɔgsi+ pɔg- + pɔ+ B$	Ask collectively that an action be carried out (Agent focus)

# 11. Molbog

**Contributors:**

**Introduction:** *R. David Zorc – Arnold Thiessen*

**Wordlist:** *Arnold Thiessen*

## 1. Introduction

Molbog is the name of the people and the language primarily centred on Balabac Island. They claim to have originated in the interior of Balabac, but are now being displaced from the eastern side of that homeland by settlers from other areas of the southern Philippines. Over the past few decades they have spread north to Ramos Island, Bancalan Island, and along the east coast of Palawan in scattered settlements such as at Batarasa and as far north as Sarong. They have also emigrated southward to Banggi and Balambangan islands in Sabah. It is estimated that there are nearly 6,000 speakers in all these areas.

Map 11. Molbog language area

The language has been cited as Melebuganon in Conklin (1952) and Voegelin – Voegelin (1977). Molbog is a member of the Palawanic subgroup of the Meso-Philippine group of Western Malayo-Polynesian. Its closest relationships are to Palawano and then to Aborlan Tagbanwa and Palawan Batak. The language has been under influence from Tausug, Jama Mapun, Sama, Bajaw, and Banggi.

Molbog is still an undescribed language apart from one comparative historical survey (Thiessen 1981) and some unpublished survey wordlists on file with the Summer Institute of Linguistics in Manila.

## 2. Phonology

### 2.1 Consonants

*Table 1. Consonants*

		Bilabial	Alveolar	Alveo-palatal	Velar	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>		<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	( <i>ʃ</i> )	<i>g</i>	
Fricatives			<i>s</i>			( <i>h</i> )
Nasals		<i>m</i>	<i>n</i>	( <i>ɲ</i> )	<i>ŋ</i>	
Laterals			<i>l</i>			
Flaps			<i>r</i>			
Semivowels		<i>w</i>		<i>y</i>		

Note: Items in parentheses are of very low frequency and are generally the result of the adoption of loanwords from Sama dialects, Malay, or Spanish, e.g., *jaŋgut* ‘beard’ or *duñaʔ* ‘world’ are ultimately from Malay. Although [h] has generally been lost historically-speaking, it is found on a few forms like *luhaʔ* ‘tears’ and *tohiʔ* ‘sew’; it is not clear if these sporadic retentions or re-introductions due to contact with languages preserving /h/ in cognate forms.

## 2.2 Vowels

Table 2. Consonants

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid			<i>ɔ</i>
Low		<i>a</i>	

Neither vowel length nor stress is phonemic and therefore do not differentiate root words.

## 3 Verb morphology

Molbog verbs are conjugated for one of four voices depending on the focus or agreement of the verb with the semantic role of the topic.

Active emphasises an actor (*daton* ‘arrive’) or a meteorological event (*dolok* ‘rain’).

Passive, marked by *-on*, emphasises an object affected (*podon* ‘extinguish’, *baʔal* ‘build’) or taken in (*okon* ‘eat’, *kawin* ‘marry’, *olon* ‘buy’).

Instrumental, marked by *i-*, emphasises an object moving away (*tulak* ‘push’, *burbur* ‘pour’) or parted with (*i-pog-olon* ‘sell’, *lobon* ‘bury’).

Local, marked by *-an*, emphasises an object partially affected (*kulit* ‘peel’, *rasa* ‘feel’), cleansed (*ugas* ‘wash’, *panis* ‘wipe off’), or removed (*bayad* ‘pay’, *buʔlian* ‘release, let go’).

However, in the active voice, verbs fall into one of two classes marked by: *-um-* (with an alternate *m-* before vowel initial stems, generally denoting punctual or intransitive actions) vs *mog-* (denoting transitive, durative, or reciprocal actions, amongst others). An analogous albeit more complex situation is described for Tagalog (see Pittman 1966 and McFarland 1976). The base forms for these distinctions in Molbog are as follows:

*um-* verb, e.g., *tutun* ‘burn’, *tolon* ‘swallow’, *tiag* ‘wake up’, *lomпой* ‘swim’  
alternate *m-*, e.g., *okon* ‘eat’, *inum* ‘drink’, *isiʔ* ‘take’, *irum* ‘seek’

*mog-* verb, e.g., *akut* ‘carry’, *gunda* ‘cook’, *tanok* ‘boil’, *taras* ‘drip’.

Some verbs, which may be described as *stative*, indicate a state achieved and are marked by the prefix *og-*, e.g., *lopun* ‘float, be floating’, *dolog* ‘burn, be burning’, or the derivatives *ogko-* (*dogog* ‘hear’, *lotog* ‘see’, *paya* ‘tired, weary’, *runut* ‘rotten’) and *ogko--an* (*boʔgon* ‘choke’, *oroti* ‘understand’).

Another common affix *po-*, indicates a *causative* construction and is evident in such pairs as: *i-po-bolos* ‘lend’ (contrast *bolos* ‘borrow’) or *i-po-lotog* ‘show’ (contrast *lotog* ‘see; look at’).

Little else is known about the morphosyntax of Molbog. However, many of the features described for that of Palawano in this volume and in Revel-Macdonald (1979) will be found to apply since the two languages are typologically and genetically very close.

## 12. Kagayanen

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Louise A. MacGregor</i>
---

---

---

### 1. Introduction

---

---

Kagayanen is one of many languages spoken in the Province of Palawan, Philippines. The municipality of Cagayancillo, which consists of the Cagayan Islands in this province, is the ethnocentre for the language and the only municipality in which Kagayanen is the predominant language spoken. The Cagayan Islands are located in the central area of the Sulu Sea between the island of Negros to the east and the main island of the Province of Palawan, which is also called Palawan, to the west. Large numbers of Kagayanen have moved to the island of Palawan during this century, so that many villages now exist scattered up and down its eastern coastal plains in which Kagayanens predominate. Kagayanens can also be found as far north as Busuanga Island and as far south as Balabac Island. The municipalities of Roxas, Puerto Princesa City, and Narra, in particular, have barrios with high concentrations of Kagayanens. Kagayanen is spoken by approximately 15,000 to 20,000 people, of whom about 5,000 live in the Cagayan Islands.

A dialect of Kagayanen called Kinagayanen is spoken on the island of Coron in the northern part of the Province of Palawan. No research has been conducted to determine how this dialect compares with Kagayanen as spoken in the Cagayan Islands. Differences between the Kagayanen spoken in the Cagayan Islands and on mainland Palawan continue to develop. Tagalog has a strong influence on the languages for those living on Palawan, whereas the trade language of Hiligaynon has greater influence on those living in the Cagayan Islands. In the comparative lexicon the abbreviation (CGC) marks those items more common to Cagayancillo and the abbreviation (PAL) marks those items more common to mainland Palawan, where such differences occur.

The major linguistic work done to date on the Kagayanen language is the unpublished 1977 doctoral dissertation of Carol Jean W. Harmon. In her dissertation she argues that Kagayanen should be classified as a Manobo language, not a Visayan one. While it has a heavy overlay of vocabulary from Hiligaynon, the language of southern Panay Island and the Province of

---

---

Negros Occidental, its grammar and functors are distinctly Manobo. Harmon links Kagayanen roots to the northern Manobo groups on the island of Mindanao. No tradition, however, exists among the Kagayanens concerning their Mindanao origins. It is surmised that the arrival of the first “Kagayanens” to Cagayancillo would have occurred more than 200 years ago based on the age of the Spanish built structures there and the date of the first known “president” of the islands.

Map 12. Kagayanen language area

Data on the Kagayanen language have been collected by the author and her husband (Scott W. MacGregor) since late 1976 during periods of residence in Caguisan, Narra, Palawan and shorter visits to Cagayancillo. Mr Javier C. Carcelar, a retired teacher and native of Cagayancillo, was of special help in preparing the wordlist for this volume. Fieldwork was conducted under the auspices of The Summer Institute of Linguistics which serves in cooperation with the Philippine government’s Department of Education, Culture, and Sports. Our work would not have been possible without the gracious assistance given by various officials and especially our neighbours in Caguisan.

## 2. Summary of phonology

The phonology statement found in the doctoral dissertation of Carol Jean W. Harmon is the basis for much of the following.

### 2.1 Word stress

Stress is not predictable but often falls on the penultimate syllable of the word. In this material, stress is only marked when it does not fall on the penultimate syllable.

### 2.2 Inventory of consonants

Kagayanen has 15 consonant phonemes.

*Table 1.* Kagayanen consonants

		Labial	Alveolar	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives			<i>s</i>		
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels		<i>w</i>	<i>y</i>		

#### 2.2.1 Discussion

All stops are unaspirated and in word final position are unreleased. A non-phonemic glottal stop is regularly inserted before a vowel initial word. /d/ is realised as [r] intervocally except in loan words.

/h/ is not included in the list of Kagayanen consonant phonemes because it only occurs in loan words, proper names, or in exaggerated pronunciation of words cognate with nearby languages in which an /h/ does occur.

[l] and [ɣ] are allophones of /l/. Harmon used the symbol [ɣ] in her dissertation for the consonant she describes as an “l-colored glide”, a term suggested to her by Anatole Lyovin. In pronouncing [ɣ] the tip of the tongue is placed behind the lower lip or lower front teeth, and the back of the tongue is raised but does not touch the velum. /l/ is realised as [l] when it is:

(1) word initial; (2) contiguous to /i/ or /y/; (3) geminate; (4) the second consonant of word-medial contiguous consonants and the first is an alveolar (except for [l]); or (5) when it is either the first or second of two word-medial contiguous consonants in a loanword from Spanish or English (usually it is the first consonant). When also not contiguous to /i/, /l/ is realised as [ɬ] when it is: (1) intervocalic; (2) word final; (3) the second consonant of a word-initial consonant cluster in which the first consonant is an obstruent; (4) the second or third consonant of word-medial contiguous consonants and the preceding consonant is bilabial or velar (except /g/); (5) the first consonant of word-medial contiguous consonants and the second is a glottal stop; or (6) when it is either of two word-medial contiguous consonants in a stem which consists of reduplicated syllables and which has a word final or word initial [l]. A few words exist which are exceptions to rules (1) and (3) for [l] and rules (1), (5), and (6) for [ɬ], but for the great majority of words the above rules apply. In the wordlist, words that are exceptions are noted as such. Examples:

[l]	1. <i>lamok</i>	'mosquito'	<i>luto</i>	'to cook'
	2. <i>gilek</i>	'angry'	<i>salyo</i>	'go place to place'
	3. <i>pelles</i>	'stormy'	<i>tallo</i>	'three'
	4. <i>adlaw</i>	'day'	<i>bunlaw</i>	'rinse'
	5. <i>bulkan</i>	'volcano'	<i>iruplano</i>	'airplane'
[ɬ]	1. <i>bulak</i>	'flower'	<i>dalem</i>	'deep'
	2. <i>sikal</i>	'to boil'	<i>katel</i>	'itch'
	3. <i>dlagan</i>	'to run'	<i>plapa</i>	'frond'
	4. <i>kinanjlan</i>	'need'	<i>tambleggen</i>	'chameleon'
	5. <i>balʔes</i>	'spoiled'	<i>dulʔog</i>	'floor joist'
	6. <i>legleg</i>	'flame'	<i>teltel</i>	'dip into'

All consonants can be geminate except for /r/ and [ɬ]. One exception, [aɬɬo] 'winnowing basket', has thus far been found. /y/ and /w/ rarely geminate and it is questionable whether /ʔ/ truly geminates or not. /ll/ in Kagayanen represents geminate [l], not the Spanish [ly].

### 2.3 Inventory of vowels

Kagayanen has four vowel phonemes.

Table 2. Kagayanen vowels

	Front	Central	Back
High	<i>i</i>	<i>ə</i>	<i>u</i>
Mid			
Low		<i>a</i>	

### 2.3.1 Discussion.

*/i/* varies freely between [i] and [ɛ] before a consonant cluster and in unstressed syllables, and between [i] and [e] elsewhere. */u/* is realised as [o] when it occurs in the final syllable of a word. */u/* also varies freely with [ʊ] before a consonant cluster and in unstressed syllables. */ə/* is the pepet vowel. Orthographically, the pepet vowel is written as *e* in Kagayanen. Both [u] and [o] are also written orthographically (so as to conform to the orthography of the national language, Filipino).

### 2.4 Notes on the shape of words and syllables

Geminate consonants most often, but not always, occur between a preceding pepet vowel and any other vowel that follows.

- (1) *gettek* 'abdomen'
- getek* 'tight fitting'
- beggas* 'milled rice'
- tallo* 'three'
- ittaw* 'person'

Geminate vowels are sequences across syllable boundaries [V.V]. This has come to exist, in many cases, because of the loss of intervocalic [h] in Kagayanen.

- | (2) | Kagayanen      | Hiligaynon      | Gloss    |
|-----|----------------|-----------------|----------|
|     | <i>ii?</i>     | <i>ihi?</i>     | 'urine'  |
|     | <i>baa?</i>    | <i>baha?</i>    | 'flood'  |
|     | <i>simbaan</i> | <i>simbahan</i> | 'church' |

When a prefix ends in a nasal, this nasal assimilates to the point of articulation of the initial consonant of the root and the initial consonant of the root (except *g* and sometimes *d*) is deleted.

(3)	<i>maŋ-kawil</i>	'will fish with hook and line'	[maŋawil]
	<i>maŋ-salap</i>	'will fish with seine net'	[manalap]
	<i>maŋ-pukot</i>	'will fish with drift net'	[mamukot]
	<i>maŋ-du-dulot</i>	'one who offers sacrifices'	[maŋdudulot]
	<i>maŋ-da-dagat</i>	'one who is on the ocean (fishing)'	[mananagat]
	<i>maŋ-ga-gawad</i>	'one who redeems'	[maŋgagawad]

An *-m-* ('actor focus, future/command') infix has been posited to describe what happens with one class of verb roots. This infix is analogous to the *-um-* infix in Tagalog. Word initial consonants drop out when *-m-* is infixed. When affixation possibilities are listed in the comparative wordlist, this infix is listed as '*m-*' since on the surface the first consonant is replaced by *m*.

(4)	<i>k-m-atay</i>	'will climb'	[matay]
	<i>p-m-uŋko</i>	'will sit'	[muŋko]
	<i>s-m-akay</i>	'will ride'	[makay]

The suffix *-en* ('object focus, future/command') changes to *-on* when suffixed to a root with [o] in its final syllable.

(5)	<i>sunog-en</i>	'will be burned'	[sunugon]
	<i>tapos-en</i>	'will be finished'	[tapuson]

When the prefixes *ma-* or *na-* are affixed to a vowel initial root, the *a* of the prefix often, though not necessarily, drops.

(6)	<i>ma-adlaw-an</i>	'will be exposed to the sun'	[madlawan]
	<i>na-idlaw</i>	'had longed for'	[nidlaw]
	<i>ma-ubos</i>	'will be used up'	[mubos]

When *-an*, *-en*, or *-on* is suffixed to a verb root whose first syllable is a vowel only, that word initial vowel is optionally deleted in some words.

(7)	<i>isab-en</i>	'do again'	[saben]
	<i>asod-on</i>	'pound with a pestle'	[suron]
	<i>ibit-an</i>	'hold on to'	[bitan]

## 13. Sarangani Blaan

---

---

**Contributor:**

**Introduction and Wordlist:** *Mary E. Rhea*

---

---

### 1. Introduction

---

Blaan (Bilaan) is a language with an estimated population of approximately 200,000 mainly in the Provinces of South Cotabato and Davao Del Sur, Republic of the Philippines. Blaan speakers are also found in the mountain ranges of Koronadal stretching into the Provinces of Sultan Kudurat and North Cotabato as far north as Lake Buluan. Sarangani Blaan and Koronadal Blaan are the two major dialects of the Blaan language although other dialects exist in the central area between these two dialects and along the Davao coast. All are to some extent mutually intelligible.

The Sarangani dialect from which the comparative wordlist is composed comprises some 75,000 speakers and is located on the Sarangani Peninsula. The general boundaries of this dialect are the Glan River in the north and the islands of Balut and Sarangani off the coast of Mindanao in the South. Some pockets of Sarangani Blaan speakers can also be found north of the Glan River and along the Davao coast.

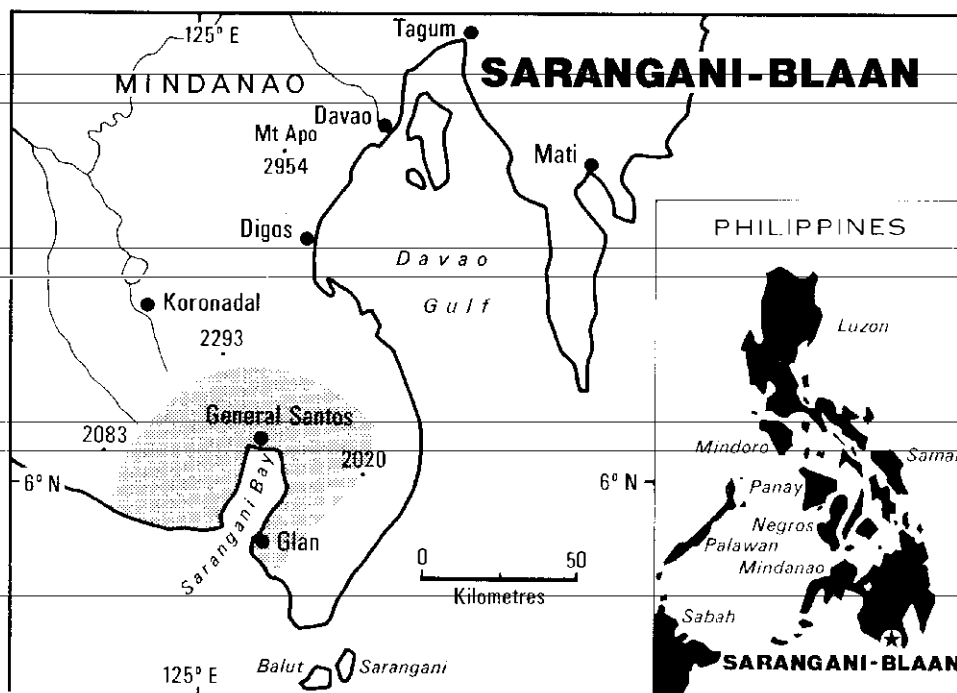

Field work has been carried out by the author since 1970 and by her co-worker, Barbara Blackburn, since 1959. Until 1973 they resided in Laguimit, Margos, Glan, South Cotabato. Further research was done from 1974-1980 with Blaan refugees in General Santos City. From 1982-1990 the researchers have resided among the Koronadal Blaan in Barrio Blaan, Malungun, South Cotabato. Data for this wordlist was gathered with the able assistance of Ricardo and Saring Roque, native speakers of the Sarangani Blaan dialect.

Linguistic research on the Blaan language has been recorded by James and Gladys Dean (1953-1955), Norman and Doris Abrams (1956-1970), Betty McLachlin and Barbara Blackburn (1959-1971), and Mary Rhea (1972-1990). Fr. Theodoro A. Llamzon has also carried out research on the Blaan language as have other scholars.

---

---

Map 13. Blaan language area

## 2. Summary of the phonology

Below is a brief overview of the phonology of Sarangani Blaan.

### 2.1 Word stress

Stress in Blaan is predictable; it occurs on the ultimate syllable of the root word.

### 2.2 Inventory of consonants

Blaan has 15 consonant phonemes.

	Bilabial	Labio-dental	Alveolar	Alveo-palatal	Velar	Glottal
Stops	vl		<i>t</i>		<i>k</i>	?
	vd	<i>b</i>	<i>d</i>		<i>g</i>	
Fricatives		<i>f</i>	<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Semivowels		<i>w</i>		<i>y</i>		

### 2.2.1 Discussion

The fricative /f/ has a bilabial allophone [ɸ] which is in free variation with [f]. All stops are unaspirated and in final position unreleased. A non-phonemic glottal stop is inserted before a vowel initial word. Glottal stop is phonemic in all other environments. /d/ is realised as [ɾ] intervocally in Sarangani Blaan and when following another consonant in Koronadal Blaan. The phoneme /r/ only occurs in borrowed words.

### 2.3 Inventory of vowels

Blaan has 8 vowels.

	Front	Central	Back
High	<i>i</i>	<i>ɨ</i>	<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low	<i>a</i>		<i>ɔ</i>

#### 2.3.1 Discussion.

/e/ tends to be lowered to its lax allophone [ɛ] in unstressed and closed CVC syllables. /i/ tends to be lowered to its lax allophone [ɪ] before *ŋ*.

There are no diphthongs in Sarangani Blaan. Each vowel forms the nucleus of a syllable. Where two vowels are written consecutively there is a glottal stop between the vowels.

### 2.4 Notes on the shape of words.

Root final /h/ although common in other dialects of Blaan seems to be in the process of being dropped in Sarangani Blaan.

(1)	Koronadal	Sarangani	
	<i>bawihan</i>	<i>bawin</i>	'his face'
	<i>milih</i>	<i>mili</i>	'transfer'

Affixes *-m-* subject focus and *-n-* object focus occur as prefixes before monosyllabic words and words beginning in a vowel, and as infixes

occurring after the initial consonant in words of more than one syllable beginning with a consonant.

(2)	/-m-təb/	‘subj foc-graze’	>	[mtəb]
	/-n-imoʔ/	‘obj foc-do’	>	[nimoʔ]
	/-n-tiis/	‘obj foc-pour’	>	[tniis]

Root initial /b/ and /f/ are dropped when -*m*- ‘subj. focus’ is affixed to words of more than one syllable.

(3)	/-m-fati/	‘subj foc-kill’	>	[mati]
	/-m-bunal/	‘obj foc-beat’	>	[munal]

Affixes *C-* are realised as *Ca-* before consonant clusters or when *C-* is the same as the initial consonant of the root word.

(4)	/s-satu/	‘reciprocal -one’	>	[sasatu]	‘oneness’
	/g-fnoʔ/	‘able to-fill’	>	[gafnoʔ]	

Similarly suffix -*C* is realised as -*aC* when following a consonant. Infix -*C-* is realised as -*aC-* when it occurs before a consonant.

(5)	/ɔgul-m/	‘corn-your’	>	[ɔgulam]	‘your corn’
	/-m-tbel/	‘subj foc-sew’	>	[tambel]	

If a -*C-* infix precedes the same consonant, the infix is realised as -*aCa-*.

	/-n-tnuʔ/	‘obj foc-add to’	>	[tananuʔ]
--	-----------	------------------	---	-----------

## 14. Bāngingi Sama

---

---

**Contributor:**

Introduction and Wordlist : *Eunice Diment*

---

---

### 1. Introduction

---

---

Bāngingi Sama is one of several related Sama languages spoken in the Sulu Archipelago of the southern part of the Republic of the Philippines. The Sama languages belong to the Sama-Bajaw subgroup of the Austronesian family of languages.

The original home of the Bāngingi people was Balangingi Island, located in the Tongkil island group, to the south of Basilan Island. After being subdued by the Spanish in 1848, the survivors fled to other islands. Most of them settled in one of three areas of the northern Sulu Archipelago: the Tongkil island group, the coastal areas and islands bordering the island of Basilan, and the southern Zamboanga peninsula. These are today the three major areas of Bāngingi population.

It is not known how many Bāngingi there are today – perhaps a generous estimate would be 6,000–10,000 – but the cluster of Sama languages and dialects spoken in the northern Sulu Archipelago, including Bāngingi, is estimated to total 60,000 people.

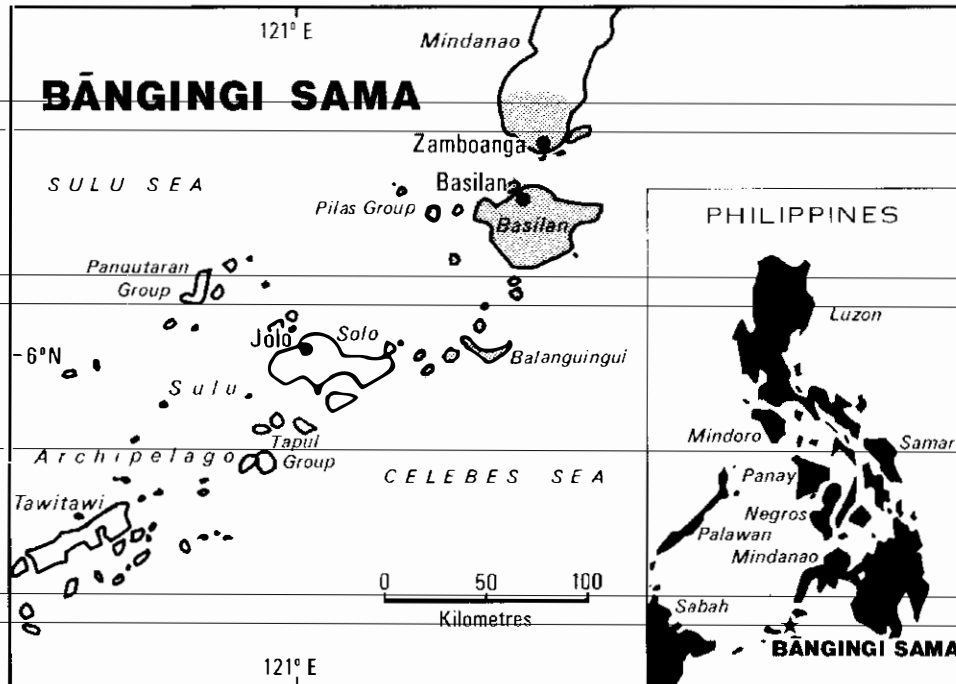

Some work on Bāngingi has been done by Geohegan (1970) and Molony (1969). The phonology of Bāngingi has been described by Gault (1979), who has also written on Bāngingi narrative discourse (1986).

Data has been gathered over a period of years by Jo Ann Gault and Eunice Diment, working under the auspices of the Summer Institute of Linguistics. Much data was gathered in 1975 and 1976 during residence in Panigayan, a coastal village on the island of Malamawi, just to the northwest of Basilan Island. The main language assistants at that time were Sulaiman Barhama and his sister Fatimah Barhama. Much of the years 1978-1981 and 1985-1988 was spent in Zamboanga City, on the southwest tip of Mindanao island, and data was gathered from Bāngingi people resident in the villages of Taluksangay, Campo Islam and Rio Hondo. A three-language vocabulary book (Bāngingi, Pilipino and English) was published in 1980 based on data already in hand, with additional data being supplied by Jamila Ballaho and

Attica Timbang. Attica Timbang was again the primary source of the further data included in the present list.

Map 14. Bāngingi Sama language area

## 2. Summary of the phonology

Below is a brief overview of the phonology of Bāngingi, based on the work by Gault (1979).

### 2.1 Word stress

Stress generally falls on the penultimate syllable of the word but if the final syllable of the word has a long vowel, the stress falls on that syllable.

### 2.3 Inventory of consonants

Bāngingi has 17 consonant phonemes.

Table 1. Bāngingi consonants

		Labial	Alveolar	Alveo-palatal	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>		<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ʃ</i>	<i>g</i>	
Fricatives			<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals			<i>l</i>			
Semivowels		<i>w</i>		<i>y</i>		

### 2.2.1 Discussion

All the consonants except /ʃ, ɲ, h/ occur as both syllable onset and syllable coda. These three occur only as syllable onset. /h/ does occur as syllable coda in some borrowed words.

The /d/ has two allophones: [ɾ] a voiced alveolar flap which occurs intervocalically, and [d] which occurs elsewhere. [ɾ] does occur word-initial in some borrowed words, but is not treated as a phoneme in this analysis.

## 2.2 Inventory of vowels

Bāngingi has five vowel phonemes.

Table 2. Bāngingi vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

**2.3.1 Discussion.** Each vowel is lowered to its respective lax allophone in closed syllables.

Vowel harmony is extensive. Mid vowels often occur together in the same roots, and high vowels often occur together in the same roots, but mid vowels never occur with high vowels in disyllabic root words.

Each vowel can occur with length, symbolised as  $\bar{a}$ ,  $\bar{e}$ ,  $\bar{i}$ ,  $\bar{o}$ ,  $\bar{u}$ . Each vowel forms the nucleus of a syllable.

## 2.4 Notes on the shape of words and syllables

Nearly all root words are disyllabic, but with affixation and reduplication many polysyllabic words result, up to seven syllables in observed data. Syllable patterns C, CVC, V and VC combine freely in polysyllabic words with the following restrictions: (1) Every phonological word begins with a consonant, therefore word-initial syllables are restricted to syllable patterns CV and CVC. (2) When the sequence VCV occurs, the syllable break is always before the consonant, therefore the syllable sequence (C)VC.V(C) cannot occur. When a vowel-initial suffix is added to a consonant-final stem, there is a change in the function of the stem-final consonant from coda to onset:

- (1) [da.gʌŋ] / /dagaŋ/ ‘to sell’  
       [da.ga.ŋʌŋ] / /dagaŋaŋ/ ‘things to sell.’

Vowel sequences are sequences across syllable boundaries:

- (2) /boa/ ‘mouth’ CV.C  
       /peat/ ‘red’ CV.VC  
       /bianiŋ/ ‘yellow’ CV.V.CVC

Six words in Bāngingi have been observed which begin with a nasal initial homorganic consonant cluster. The initial nasal is clearly the syllable nucleus, and in disyllabic words also carries the stress. Its historical antecedent is CVC, specifically  $ʔaC$  as determined by its occurrence in other Sama languages, but the schwa has for the most part disappeared from the Bāngingi language and is not now phonemic.

- (3) /ŋpat/ ‘four’  
       /ŋnom/ ‘six’  
       /ŋmaʔ/ ‘father’  
       /ŋboʔ/ ‘grandfather’  
       /ŋbohoʔ/ ‘just now; so that; before’  
       /ŋgaʔi/ ‘negative’

Between numerals and certain roots, a nasal occurs, whose phonemic shape is determined by the point of articulation of the initial consonant of the following root.

- |     |         |     |           |   |              |                |
|-----|---------|-----|-----------|---|--------------|----------------|
| (4) | /lima/  | + N | + /jām/   | → | /limanjām/   | ‘five hours’   |
|     | /waluʔ/ | + N | + /kehet/ | → | /waluŋkehet/ | ‘eight slices’ |
|     | /dua/   | + N | + /pūʔ/   | → | /duampuʔ/    | ‘twenty’       |

Assimilation occurs with the prefixation of the nasal-final prefixes aN- and paN-.

- |     |      |             |   |              |                                      |
|-----|------|-------------|---|--------------|--------------------------------------|
| (5) | aN-  | + /bissada/ | → | /ʔamissada/  | ‘speak’                              |
|     |      | + /tahiʔ/   | → | /ʔanahiʔ/    | ‘sew’                                |
|     | paN- | + /kolloʔ/  | → | /paŋolloʔan/ | ‘place where something was obtained’ |

Phoneme loss occurs in some cases when a glottal-initial stem is prefixed with a vowel-final suffix.

- |     |       |            |   |          |             |
|-----|-------|------------|---|----------|-------------|
| (6) | /ta-/ | + /ʔandaʔ/ | → | /tandaʔ/ | ‘seen’      |
|     | /pa-/ | + /ʔakkom/ | → | /pakkom/ | ‘face down’ |
|     | /ni-/ | + /ʔubus/  | → | /niubus/ | ‘finished’  |

Phoneme insertion occurs in some cases with suffixation. An /h/ is realised between a stem ending in a vowel and a vowel-initial suffix.

- |     |         |         |   |            |                 |
|-----|---------|---------|---|------------|-----------------|
| (7) | /boa/   | + /-un/ | → | /boahun/   | ‘take it’       |
|     | /billi/ | + /-in/ | → | /billihin/ | ‘buy (for him)’ |

Root perturbation occurs with suffixation of roots whose final syllable has the phonemic shape /hV/.

- |     |        |             |   |            |                  |
|-----|--------|-------------|---|------------|------------------|
| (8) | /puhi/ | + /-in--an/ | → | /pinuihan/ | ‘put out to dry’ |
|     | /dahu/ | + /-an/     | → | /dauhan/   | ‘first’          |

## 15. Timugon Murut

**Contributor:**

Introduction and Wordlist: *D.J. Prentice*

### 1. Introduction

The word “Murut” has long been used for two different groups of languages spoken in an area of Borneo overlapping the borders of the Malaysian States of Sabah and Sarawak, and the Indonesian province of East Kalimantan. In Sarawak, the term refers to languages closely related to Kelabit and spoken by inhabitants of the 5th Division, of neighbouring areas of East Kalimantan, and of the upper reaches of the Padas R. in Sabah, where the same people are known as “Lun Daye(h)”. In Sabah, the word “Murut” refers to those ethnic groups inhabiting the S.W. quarter of the state and extending for an uncertain distance into East Kalimantan. These Murut-speakers, whose languages show far greater similarities with the languages of the Philippines, are known in Sarawak as “Tagal”. The Sabahan Murut language represented here is termed

Map 15. Timugon Murut language area

*Timugon* by its speakers (from *timuo* 'water' + *-on*, obsolete locative suffix), and exists in 4 dialects: Bukow and Binta?, spoken on the coastal plain, and Kapagalan and Poros, spoken in the hinterland upstream of the Padas Gorge, respectively along the courses of the Pegalan and Padas rivers. The material presented here originates from the Poros dialect as spoken by the late Haji Musa Jimin bin Sanggah, his wife Sinoyong, and his son Jinuin Jimin, my adoptive parents and brother.

The following grammatical description is very brief. A detailed analysis can be found in Prentice (1971).

## 2. Phonology

2.1 The phonemes of Timugon Murut are presented in Table 1 and 2 below.

*Table 1.* Timugon Murut consonants

	Labial	Dental/ Alveolar	Palatal	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives		<i>s</i>			
Affricates			<i>tʃ</i>		
Nasals	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals		<i>l</i>			
Semivowels	<i>w</i>		<i>y</i>		

*Table 2.* Timugon Murut vowels

Vowels	<i>i</i>	<i>u</i>	Diphthongs	<i>iw</i>	<i>uy</i>
	<i>o</i>			<i>ow</i>	<i>oy</i>
	<i>a</i>			<i>aw</i>	<i>ay</i>

2.2 A. The voiced stops /b, d, g/ have fricative allophones [β, r, γ] post-vocally, also following a morpheme boundary:

/ibiton duandu? no da gaŋas/  
 [i'βitɔn du'andu? nɔ ra 'ɣaŋas]  
 convey woman the RA Gangas  
 'The woman will be conveyed to Gangas.'

/ibiton ku duandu? no da gaŋas/  
 [i'βitɔn ku ru'andu? nɔ ra 'ɣaŋas]  
 convey I woman the RA Gangas  
 'I will convey the woman to Gangas.'

/ibiton duandu? min da gaŋas/  
 [i'βitɔn du'andu min ra 'ɣaŋas]  
 convey woman you RA Gangas  
 'Your kinswoman will be conveyed to Gangas.'

B. The allophones [d] and [r] of /d/ are in the process of becoming separate phonemes under the influence of massive borrowing from Malay and English where the two sounds are usually kept distinct. Word-final [d] in English loanwords yields Timugon /-t/ ([d] does not occur word-finally in Malay, the other major source of loans).

C. Phonemic sequences of two identical vowels are phonetically realised as single long vowels: /taŋkuŋ/ [t'aŋkʊŋ] 'k.o. musical instrument' vs /taŋkuuŋ/ [t'aŋ'kūŋ] 'hunchback(ed)' and /monsoy/ [m'ɔnsɔy] '(of relationship) will improve' vs /moonsoy/ [m'ɔnsɔy] 'good'.

**2.3** Stress is non-phonemic and falls regularly on the nucleus of the penultimate syllable of the word. When this nucleus is part of a vowel complex, stress falls on the syllabic component of the complex:

/mausug/ [m'ausʊɣ] 'satiated, full'  
 /bibiisan/ [bi'βiisan] '(of animal) striped'

**2.4** As a general rule, /a/ and /o/ do not occur adjacently to each other. Even when separated by word-boundaries within a phrase, /a/ and /o/ assimilate with each other (the vowel preceding the word boundary assimilating to the following).

/sala? ka okow/ [sala? k'ɔkow] '(it is/was) not you'  
 /sala? ka aku/ [sala? k'āku] '(it is/was) not I'  
 /makito no aku da odow ti/ [makita'nāku r'ɔrowti]  
 see he I RA day the 'he will see me today'

**2.5** Within words, the following rules prevail concerning the distribution of phonemes:

- A. In the final syllable, all 4 vowels may occur without restriction (although /u/ is not known to occur in any suffix, either inflectional or derivational).
- B. In the penultimate syllable of a lexeme /o/ can only occur if the final syllable also contains /o/. The other 3 vowels occur without restriction.
- C. In pre-penultimate syllables, of words and lexemes, the distinction between /o/ and /a/ is neutralised: /o/ occurs only when all following syllables contain /o/; otherwise /a/ occurs. There are no constraints on the occurrence of the other two vowels /i/ and /u/.
- D. /w/ does not occur adjacent to /u/, nor does /y/ adjacent to /i/.
- E. /ʀ/ occurs only word-finally (and is therefore elided in suffixation, see 3.3.E. below), whereas /j/ and /ñ/ never occur word-finally.
- F. /NC/ (as opposed to borrowed) words consist of combinations of nasal + homorganic consonant (NC) in word-medial position. Only one such NC combination is permitted per word (for morphophonemic consequences, see 3.3.C. below).

### 3. Morphology and morphophonemics

#### 3.1 Voice

Murut main-clause verbs can appear in 3 different voices: Sf, Of and Rf. The subject of an Sf verb is regularly the agent of the action or the entity involved in the process implied by the verb, while the subjects of Of and Rf verbs are regularly the direct (accusative) and indirect (dative or benefactive) objects respectively of the verb concerned. There are two other voices (Associative and Instrumental), but these are restricted to certain types of subordinate clauses and are not further discussed here. Sf-verb forms involve various affixes: *-um-*, *mag-*, *maŋ-* and *ma-*, the last either alone or in combination with other morphemes in hyper-affixes like *mapa-* (*pa-* = causative), *maki-* (*ki-* = petitive), *mati-* (*ti-* = desiderative, uncontrollability), etc. When one verb-base has more than one Sf-form, there is always a grammatical and/or semantic distinction. Thus alternations like *-um-* ~ *mag-* and *-um-* ~ *maŋ-* correspond to 'intransitive' ~ 'transitive', whereas alternation *mag-* ~ *maŋ-* corresponds to 'transitive with non-specific object' ~ 'transitive with specific object'. Of-forms use the suffix *-on*, either alone or in combination, e.g. *pag-on*, *paŋ-on*,

*papa-* -on, *paki-* -on etc., which correspond more or less regularly to Sf forms with *mag-*, *maŋ-*, *mapa-*, *maki-* etc. Rf-forms are marked by *-in* (or, as with *-on*, combinations with various prefixes, e.g. *pag-* -in, *paŋ-* -in, *papa-* -in etc.)

There are many irregularities: some verbs have no Sf-forms (e.g. *ani?* ‘give’ which in Timugon only occurs in Rf-form: *anīn*); some verbs use the Rf-form with *-in*, rather than the Of-form with *-on*, when the subject is direct object (e.g. *patid* ‘throw away’ which has only the passive *patidin*, not *\*\*patidon*); and some intransitive verbs use Of- and Rf-forms to subjectivise other arguments than direct and indirect object (e.g. *oŋoy* ‘go (somewhere)’, *oŋoyon* ‘go for something, go to get something’). In the comparative wordlist, verb-forms are given in the order Sf-Of-Rf. Unless otherwise indicated, the first form marks the agentive, the second the accusative and the third the dative/benefactive case. Formal exceptions are specified.

### 3.2 Aspect

With the exception of a large number of stative verbs (or “adjectives”), most Murut verbs exhibit in all voices three different aspect-forms: the non-Perfect (nP) (i.e. the form used as citation-form for the affixes in the previous paragraph), indicating an action not (yet) completed or a situation not (yet) realised; the Perfect (P) denoting action completed or situation realised; and the Atemporal (At) which is neutral regarding “complete/incomplete” and often used as imperative and/or narrative verb form, when concepts such as “completed/not-completed” are irrelevant or already determined by the context.

The great majority of Timugon adjectives occur with prefix *ma-* and do not show aspect differentiation.

### 3.3 Forms

The complicated morphophonemics of Timugon’s affix system can only be treated summarily in this introduction.

#### A. *-um-*

The infix *-um-* (Sf, non-perfect) alternates with *imin* (Of, perfect) and  $\emptyset$  (Sf, temporal). The allomorphs are determined by the initial phoneme of the stem, as follows:

Table 3. *-um-* (forms)

Initial phoneme	nP	P	At
V	<i>m-</i>	<i>min-</i>	∅
b, p, m	<i>M-</i>	<i>Min-</i>	∅
other	<i>um-</i>	<i>imin-</i>	∅

V = vowel

P = perfect

M = /m/ replacing homorganic consonant

At = Atemporal

nP = non-perfect

Table 4. *-um-* (examples)

	nP	P	At
<i>oŋoy</i> 'go'	<i>moŋoy-</i>	<i>minoŋoy</i>	<i>oŋoy</i>
<i>patoy</i> 'die'	<i>matoy</i>	<i>minatoy</i>	<i>patoy</i>
<i>mitiŋ</i> 'meet (officially)'	<i>mitiŋ</i>	<i>minitiŋ</i>	<i>mitiŋ</i>
<i>tūn</i> 'go down'	<i>tumūŋ</i>	<i>tūminu</i>	<i>tūn</i>

B. *ma(-x)-*

Prefixes beginning with *ma-* (e.g. *ma-*, *mag-*, *maŋ-*, *mapa-*, *maka-*, etc.) are subject to the vowel-distribution rules explained in 2.5 above. If the following vowel (i.e. the first vowel of the base) is *o*, all *a*'s in these prefixes adjacent to that vowel assimilate to it (thus *mo-*, *mog-*, *moŋ-*, *mopo-*, *moko-* etc.). This does not apply to prefixes *maki-*, *mati-*, etc., where the presence of a morpheme (*-ki-*, *-ti-*) containing a vowel other than *a* or *o* blocks the assimilation. Thus *kito* 'see' yields *mapakito* 'cause to be seen, show', while *doŋō* 'hear' yields *mopodoŋō* 'cause to be heard', both formed with the prefix *mapa-*.

The aspect-forms of *ma(X)-* type prefixes are very regular:

Table 5. *ma(X)-* (forms)

	nP	P	At
<i>ma(X)-</i>	<i>ma(X)-</i>	<i>na(X)-</i>	<i>pa(X)-</i>

In these prefixes, initial *m-* indicates non-perfect, initial *n-* perfect, and initial *p-* atemporal aspect. Two of these prefixes, *mag-* and *maŋ-*, can have morphophonemic effects upon the verb-stem and are discussed separately below.

### C. *mag-*

This prefix has various allomorphs, most of them conditioned by the phonology of the first segment of the stem, and often yielding prenasalisation with a homorganic nasal consonant:

initial phoneme	allomorph
V	<i>mag-</i> ~ <i>mog-</i>
b, p	<i>mam-</i> ~ <i>mom-</i>
t, s	<i>man-</i> ~ <i>mon-</i>
k	<i>maŋ-</i> ~ <i>moŋ-</i>
d, l, ʃ, g	<i>mampa</i> ~ <i>mompo-</i>
other	<i>ma-</i> ~ <i>mo-</i>

In accordance with rule 2.5.F, the prefix *mag-* takes the form /*ma-* ~ *mo-*/ with roots containing an -NC- sequence.

Examples:

<i>ansak</i>	‘cook’	> <i>magansak</i>
<i>bāl</i>	‘make’	> <i>mambāl</i>
<i>ompod</i>	‘flatter’	> <i>mogompod</i>
<i>talán</i>	‘sell’	> <i>mantalan</i>
<i>kodojo</i>	‘work’	> <i>moŋkodojo</i>
<i>lobon</i>	‘hold a funeral’	> <i>mopolobon</i>
<i>dondon</i>	‘stay home’	> <i>modondon</i>

(N.B. There exists a homophonous prefix *mag-*, producing reciprocal verbs, which has somewhat different morphophonemic rules. This prefix will be ignored here.)

### D. *maŋ-*

The allomorphs of this prefix, like those of *mag-*, also involves nasal consonants homorganic with the initial consonant of the stem. In this case, however, the process involved is not prenasalisation, but nasalisation

(sometimes termed nasal replacement), whereby the initial consonant is replaced by its nasal counterpart (indicated by capital letters in the following table):

initial phoneme	allomorph	
V	<i>maŋ-</i>	~ <i>moŋ-</i>
b, p	<i>maM-</i>	~ <i>moM-</i>
t, s	<i>maN-</i>	~ <i>moN-</i>
k	<i>maŊ-</i>	~ <i>moŊ-</i>
d, l, ʃ, g	<i>mama-</i>	~ <i>momo-</i>
others	<i>ma-</i>	~ <i>mo-</i>

Examples:

<i>patid</i>	‘throw away’	>	<i>mamatid</i>
<i>bilin</i>	‘warn’	>	<i>mamilin</i>
<i>pili?</i>	‘choose’	>	<i>mamili?</i>
<i>lobon</i>	‘bury’	>	<i>momolobon</i>
<i>solob</i>	‘burn’	>	<i>monolob</i>
<i>idu?</i>	‘remove’	>	<i>manidu?</i>
<i>kotop</i>	‘graze’	>	<i>moŋotop</i>
<i>tanom</i>	‘plant’	>	<i>mananom</i>

#### E. *-on* and *-in*

The Of- suffix *-on* and Rf- suffix *-in* have aspect -forms as displayed in table 6 below:

Table 6. *-on* and *-in* (forms)

nP	P	At
<i>(pa(X))--on</i>	<i>(p)--in-(aX-)</i>	<i>(pa (X))--o?</i>
<i>(pa (X))--in</i>	<i>(p)--in-(aX-)--an</i>	<i>(pa (X))--i?</i>

Both affixes have effects upon base forms, as already explained above: base-final /ʔ/ disappears in the presence of a suffix (see 2.5.E.); base-final /y/ disappears when adjacent to suffix *-in* or *-i?* (see 2.5.D); distribution patterns of /a/ and /o/ change when suffixes *-on*, *-o?*, *-in*, *-i?*, *-an* are added (see 2.4. and 2.5 above).

## Examples

Table 7: Voice/aspect

		nP	P	At
<i>patoy</i> ( <i>maŋ-</i> ; <i>-on</i> ; <i>-in</i> ) 'slaughter O (for R)'	Sf	<i>mamatoy</i>	<i>mamatoy</i>	<i>pamatoy</i>
	Of	<i>potoyon</i>	<i>pinatoy</i>	<i>potoyo?</i>
	Rf	<i>patain</i>	<i>pinatayan</i>	<i>patai?</i>
<i>bali</i> ( <i>mag-</i> ; <i>-on</i> ; <i>-in</i> ) 'buy O (for R)'	Sf	<i>mambali</i>	<i>nambali</i>	<i>pambali</i>
	Of	<i>balion</i>	<i>binali</i>	<i>balio?</i>
	Rf	<i>balin</i>	<i>binalian</i>	<i>balī?</i>

	Of	—	—	—
	Rf	<i>patidin</i>	<i>pinatidan</i>	<i>patidi?</i>
<i>kidim</i> ( <i>maŋ-</i> ; <i>-in</i> ) 'send R s.th.'	Sf	<i>maŋidim</i>	<i>naŋidim</i>	<i>paŋidim</i>
	Of	—	—	—
	Rf	<i>kidimin</i>	<i>kinidiman</i>	<i>kidimi?</i>
<i>kidim</i> ( <i>mapa-</i> ; <i>pa--on</i> ) 'send O (to s.o.)'	Sf	<i>mapakidim</i>	<i>napakidim</i>	<i>papakidim</i>
	Of	<i>pakidimon</i>	<i>pinakidim</i>	<i>pakidimo?</i>
	Rf	—	—	—

3.4. Besides the array of normal verbals, with their affixation for Sf (*-um-*, *mag-*, *maŋ-*, *ma(X)-*), Of (*(pa(X))-on*) and Rf (*(pa(X))-in*), there exists a

parallel system of verb-forms (termed ‘participles’ in Prentice 1971, for lack of a better term; the term will be retained here) which have parallels with the voice system of the ordinary verbs, as shown in Table 8 below.

*Table 8: Verb and participles (Voice/aspect: forms)*

Verbs			Particles (part)		
nP	P	At	nP	P	At
-um-	-imin-	∅	<i>maka</i>	<i>naka-</i>	<i>paka-</i>
Sf <i>mag-</i>	<i>-nag-</i>	<i>pag-</i>	<i>naka(pag)-</i>	<i>naka(pag)-</i>	<i>paka(pag-)</i>
Of <i>-on</i>	<i>-in-</i>	<i>-o?</i>	<i>ma-</i>	<i>na-</i>	<i>ka-</i>
Rf <i>-in</i>	<i>-in--an</i>	<i>-i?</i>	<i>ma--an</i>	<i>na--an</i>	<i>ka--i?</i>
			or		
			<i>ka--an</i>		

Some of the semantic and or syntactic functions conveyed by the ‘verb-particle’ distinction are illustrated below:

- minuli* *io*  
go-home, Sf, P he ‘he has gone home’.

*nakauli?* *io*  
go-home, Sf (part), P he ‘he has arrived home’, ‘he is home’
- kalo muli?* *aku*  
not-go home Sf, nP I ‘I’m not going home’

*kalo makauli?* *aku*  
not-go-home, Sf (part), nP I ‘I can’t go home; (with sentence-medial intonation: if I don’t get home ...)’
- minuli?* *kow kia*  
go-home, Sf, P you ? ‘did you go home?’

*nakauli?* *kow kia*  
go-home, Sf, P you ? ‘did you get home?’
- akanon* *kia kinawa?* *-ti*  
eat, Of, nP ? fruit the ‘Is this fruit going to be eaten?’

*mākan* *kia kinawa?* *-ti*  
eat, Of (part), P ? fruit -the ‘Is this fruit edible?’

Wordlist: <i>P. Vérin – K. A. Adelaar</i>
---

---

### 1. Introduction

---

Malagasy, the westernmost member of the Austronesian language family, is spoken in Madagascar and on part of the island of Mayotte, in the Comoros. Speakers of Malagasy number about ten million. The language has a rather complex morphology, and it has a “Philippine” type topicalisation system. Its basic word order is verb-initial and topic-final.

The closest relatives of Malagasy are the Southeast Barito languages of South Kalimantan. It has also undergone much influence from Bantu languages (Ngazije, Ndzuani [Comoros], Swahili), Malay, Javanese, Sanskrit, Arabic, Persian, French and English. Sanskrit influence came into Malagasy via Malay and Javanese, and much of the Arabic and Persian influence was borrowed via Bantu languages.

The Malagasy dialect used in the comparative wordlist is Merina, which is spoken in the central highlands. Merina formed the basis of modern standard Malagasy, and it is reasonably well documented: among the basic reference works are a Merina - English dictionary by Richardson (1885), a Merina - French dictionary (1970) and French - Merina dictionary (1973) by Abinal and Malzac, a Malagasy - Malagasy explanatory dictionary by Rajemisa-Raolison (1985), and grammars by Cousins (1894), Malzac (2nd edition 1926) and by Rajaona (1972). Merina is the subject of a number of linguistic studies by Keenan (Keenan 1972, 1976) and by Keenan and Ochs (1979).

Other Malagasy dialects are usually poorly documented. They are Sakalava (West), Bara, Vezo, Antandroy and Mahafaly (Southwest), (Merina), Betsileo, Sihanaka (Central-East), Antaimoro, Antaisaka, Zafisoro (Southeast), Betsimisaraka, Antambahoaka (Northeast), Tsimihety and Antankarana (North). Merina and Sakalava are the major dialects. Important phonological characteristics of Sakalava are the loss of Proto-Malagasy final nasals, (whereas Merina added a voiceless *a*, symbolised *ã*, to them), the development of Proto-Malagasy *\*-t* into Sakalava *-øe* (compare Merina *-tʰã*), and the retention of Proto-Malagasy *\*li* and *\*ti* (which became Merina *di*, *tsi*; *ts* is written *ç* in the data presented here). Compare:

---

Proto Malagasy	<i>*taŋan</i> 'hand' > Sakalava <i>táŋa</i> , Merina <i>tánanã</i>
	<i>*kulit</i> > 'skin' > Sakalava <i>húliŋe</i> , Merina <i>húdiŋ'ã</i>
	<i>*putiq</i> 'white' > Sakalava <i>fúti</i> , Merina <i>fúŋi</i>

Dez (1963) gives qualitative evidence for a division of the dialects into (roughly) a Southern + Western group vs a Central + Eastern group, provisionally including Tsimihety and Antankarana into the Southern + Western group. Vérin, Kottak and Gorlin (1969), on the basis of lexicostatistics, distinguish a split-off of the northern dialects into two primary subgroups, and they divide the remaining dialects into a Southern + Western branch and a Central + Eastern branch. Simon (1988) criticizes Dez' main device for a dialectal classification which is the development (or not) of *\*li* to *di* and of *\*ŋi* to *ŋi*. He points out that this development was already going on in the Southeast Barito area: its origin must predate the Malagasy migration to East Africa, and hence it cannot be critical for a Malagasy dialect classification (see also Dahl 1977:126). Simon proposes an original dialect chain going from Southwest to Northeast Madagascar, which is obscured by more recent isoglosses shared by central and east coast dialects.

Map 16. Malagasy language area

The most important contribution to the study of the origin of Malagasy is Dahl (1951; 1977), who shows the relationship of Malagasy with the

Southeast Barito languages (among others Maanyan). Other comparative-historical studies are Simon (1988), Mahdi (1988) and Adelaar (1989 and in press). Mahdi also treats part of the rather complicated morphophonemics of Merina.

For further basic information on Malagasy linguistic literature (including the dialects), see Dahl (1951), Dez (1988) and the *Linguistic Bibliography*.

The orthography of the Malagasy material presented here differs from the official Malagasy orthography in that the symbols *o*, *y*, *j*, *tr*, *dr* and *ts* have been replaced by their phonetic realisation *u*, *i*, *dʒ*, *tʳ*, *dʳ* and *ʔ* respectively, and in that stress is indicated wherever it is relevant to the argument, or wherever it is not predictable from the word-structure. Unless indicated otherwise, etymological information is based on Dahl (1951, 1988) and on Adelaar (1989 and in press).

## 2. Malagasy phonology

Table 1. Malagasy consonants

	Labial	Alveolar	Retroflex	Velar	Glottal
<b>Stops</b>					
voiceless	<i>p</i>	<i>t</i>		<i>k</i>	
voiced	<i>b</i>	<i>d</i>		<i>g</i>	
<b>Affricates</b>					
voiceless		<i>ʧ</i>	<i>tʳ</i>		
voiced		<i>dʒ</i>	<i>dʳ</i>		
<b>Fricatives</b>					
voiceless	<i>f</i>	<i>s</i>			<i>h</i>
voiced	<i>v</i>	<i>z</i>			
Nasals	<i>m</i>	<i>n</i>			
Laterals		<i>l</i>			
Trills		<i>r</i>			

Table 2. Malagasy vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		
Low		<i>a</i>	

(diphthongs are not distinguished on the phonemic level)

In the Merina dialect there is no phoneme /o/, but /ua/ sequences are pronounced as [o], and /au/ sequences are pronounced as [ɔ] (cf. 'luat<sup>r</sup>ǎ 'too much' [lɔt<sup>r</sup>ǎ]; 'taunǎ 'year' [tɔnǎ]).<sup>1</sup>

In some cases, penultimate *i* and final syllable <sup>r</sup>t, *k*, and *n* are archiphonemes which change in the process of suffixation; see below.

Stress usually falls on the penultimate syllable of a disyllabic root, and on the antepenultimate syllable of a root of more than two syllables. Stress is phonemic and morphological: compare 'lalanǎ 'road, path' versus la'lanaǎ 'law' (see below for morphological stress). Vowels which are not stressed have a reduced pronunciation. /h/ is often not pronounced.

All roots and derivations end in a vowel. The great majority of unaffixed roots are trisyllabic or disyllabic, but monosyllables and roots of more than three syllables also occur.

A large portion of the roots end in the sequences -t<sup>r</sup>ǎ, -kǎ or -nǎ (consisting of the archiphonemes <sup>r</sup>t, *k*, *n* + ǎ). Each consonant (other than the archiphonemes) can be ∅ or a cluster consisting of a stop or affricate preceded by a homorganic nasal. If they have more than two syllables, their penultimate vowel is *a*, *u*, or the archiphoneme *i*. Roots belonging to this pattern developed from Proto-Malayo-Polynesian/Proto-Southeast-Barito \*(C)V(C)VC roots.

Other roots (i.e. roots of a 'CVCV -, 'CV or (...)CV'CVCV structure which do not end in the sequences -t<sup>r</sup>ǎ, -kǎ or -nǎ) have penultimate stress (or, in the case of monosyllables, final-syllable stress). Each slot can be ∅, C or a cluster consisting of a stop or affricate preceded by a homorganic nasal. These roots developed from Proto-Malayo-Polynesian/Proto-Southeast-Barito \*(C)V(C)V roots or from \*(C)V(C)VC roots of which the last consonant became ∅.

Suffixation entails the following changes:

a) in roots ending in -t<sup>r</sup>ǎ, -kǎ or -nǎ:

- final ǎ is deleted
- as a last consonant,
 

<sup>r</sup> t	becomes	r, t or f
<i>k</i>	becomes	h or f
<i>n</i>	becomes	n or m
- if the root has more than two syllables, stress moves to the following syllable, and the archiphoneme *i* in the second syllable sometimes changes to *e*.

1. In some other Malagasy dialects this contraction has not taken place.

Examples:

' <i>fantatʰă</i>	'known'	<i>fan'tar-ină</i>	'to be known'
<i>seʰă</i>	'eager, hurried'	<i>ha-'ser-ană</i>	'haste, precipitation'
' <i>tutuʰă</i>	'filled, covered'	<i>tu'tuf-ană</i>	'to be filled (a place)'
<i>man-'dʰitʰă</i>	'to evaporate'	' <i>rit-ină</i>	'to be dried up'
' <i>alină</i>	'night'	<i>fī-a'lem-ană</i>	'supper(-time)'
' <i>lalină</i>	'deep'	<i>fan-da'lin-ănă</i>	'(the act of) making deeper'
<i>mi-'tană</i>	'to seize, hold'	' <i>tan-ană</i>	'to be seized, held' (< * <i>taan</i> )
' <i>hazakă</i>	'k.o. scab or itch'	<i>ha'zah-ină</i>	'covered with scabs'
<i>mi-'çokă</i>	'to blow'	' <i>çof-ină</i>	'to be blown' (< * <i>tiup</i> )

b) in other roots:

- stress moves to the following syllable
- final *i* sometimes becomes *e* or *a*
- the last vowel (other than *u*) sometimes merges with initial *a* or *i* of the suffix
- sometimes, *s*, *z*, *v*, *r*, *n* (or even *-av-*, *-az-*, *-an-*) occurs between bound root-form and suffix

Examples:

' <i>iri</i>	'ardent desire'	<i>i'rină</i>	'to be desired'
<i>ma'mafi</i>	'to sow, disseminate'	<i>fa'faz-ană</i>	'to be sown'
' <i>tʰatʰa</i>	'overtaken, caught'	' <i>tʰa'tʰar-ină</i>	'to be overtaken'
<i>ha'raru</i>	'obstruction, prevention'	<i>hara'ru-ină</i> ,	'to be prevented,
		<i>hara'ru-ană</i>	impeded'
<i>mi-'tadi</i>	'to seek, search for'	<i>tadi'av-ină</i>	'to be sought, looked for'

## 2.1 Sandhi

The words constituting a verb phrase, a possessive construction, a reduplication or a compound are subject to a number of sandhi rules. First, if the initial consonant of the second component of a phrase, reduplication or compound is a fricative or liquid, it undergoes the following changes:

<i>v</i> → <i>b</i>	<i>z</i> → <i>dʒ</i>
<i>f</i> → <i>p</i>	<i>r</i> → <i>dʰ</i>
<i>h</i> → <i>k</i>	<i>l</i> → <i>d</i>
<i>s</i> → <i>ç</i>	

As far as the first component of a phrase, a possessive construction, reduplication or compound is concerned, the following situations occur:

a) If the first component ends in *-tʳă* or *-kă*,

- *-tʳă* or *-kă* is dropped before a consonant
- *-tʳă* becomes *-tʳi*, and *-kă* becomes *-ki*, before the article *ni*<sup>1</sup>
- *-tʳă* and *-kă* lose *ă* before a vowel.

Examples:

<i>mamuçi-puçikă</i>	‘to knead’	(← <i>mamuçikă, fuçikă</i> )
<i>zanak-usi</i>	‘kid’	(← <i>zanakă, usi</i> )
<i>hudi-masu</i>	‘eyelid’	(← <i>hudiʳă, masu</i> )
<i>hatu-tanană</i>	‘wrist’	(← <i>hatukă, tanană</i> )
<i>vantuʳ-akuhu</i>	‘chick’	(← <i>vantuʳă, akuhu</i> )
<i>ni tanɖʳuki ni umbi</i>	‘the horns of the cow’	(← <i>tanɖʳukă, ni, umbi</i> )
<i>tamenak-atudi</i>	‘egg yolk’	(← <i>tamenăka, atudi</i> )

b) If the first component ends in *-nă*, *ă* is dropped, while the remaining *-n-* becomes *-m-* before a labial consonant, and  $\emptyset$  before a nasal. Examples:

<i>fehezan-dzavaʳă</i>	‘bunch’	(← <i>fehezană, zavaʳă</i> )
<i>taulam-panavi</i>	‘collar-bone’	(← <i>taulană, fanavi</i> )
<i>vurum-puçi</i>	‘white egret, <i>Ardea bubulcus</i> Sav.’	(← <i>vurună, fuçi</i> )
<i>vuru-maheri</i>	‘k.o. falcon, <i>Falco minor</i> , Bp.’	(← <i>vurună, ma-heri</i> )
<i>lalin-dalină</i>	‘not too deep’	(← <i>lalină, lalină</i> )
<i>rançan-tunguʳă</i>	‘toe’	(← <i>rançană, tunguʳă</i> )
<i>anaran-ni zaza</i>	‘the child’s name’	(← <i>anarană, zaza</i> )

c) If the first component does not end in *-tʳă*, *-kă* or *-nă*, *-m-* is inserted between its vowel and a following labial consonant, and *-n-* is inserted in all other cases.

Examples:

<i>tʳanu-m-burună</i>	‘bird’s nest’	(← <i>tʳanu, vurună</i> )
<i>tʳanu-n-umbi</i>	‘stable, stall’	(← <i>tʳanu, umbi</i> )
<i>ranu n-kazu</i>	‘sap’	(← <i>ranu, hazu</i> )
<i>tai-n-çufină</i>	‘earwax’	(← <i>tai, sufină</i> )
<i>lapa-n-ni mpandzakă</i> <sup>2</sup>	‘the king’s palace’	(← <i>lapa, ni, mpandzakă</i> )

1. *ni* is comparable (but not identical) to the English definite article.

2. With a geminated pronunciation of *n*.

Exceptions:

Roots which do not end in *-f'ă*, *-k'ă* or *-nă*, do not undergo any changes when reduplicated, e.g. *veta-veta* 'detestable'; some words, like *masu*, are not followed by a nasal when occurring in a compound, compare *masu-and'u* 'sun' (← *masu*, *and'u*).

### 3. Inventory of the affixes occurring in the comparative wordlist

Note: in the examples given below, forms between square brackets are precategoryals (which only occur in derivations); the symbol  $\emptyset$  stands for object of a transitive verb.

#### 3.1 Adjectival and verbal affixes

Malagasy verbs and adjectives usually have one of the following affixes:

*ma-* This prefix usually forms adjectives, sometimes also transitive verbs. It has an allomorph *m-* which occurs before a base with initial *a-* or *e-*.

Examples:

<i>[izină]</i>		<i>ma-izină</i>	'dark'
<i>(h)enaŋ'ă</i>	'shame, bashfulness'	<i>menaŋ'ă</i>	'ashamed, bashful'
<i>[hanŋ'u]</i>		<i>ma-hanŋ'u</i>	'to cook'

Note: Verbs which take *ma-* can also take *mampa-* (forming a causative), *mifa-* (forming reciprocal forms) and *mifampa-* (forming reciprocal-causatives). These derivations are not represented in the wordlist.

*mi-* This prefix forms verbs which are usually (but not always) intransitive. It has an allomorph *m-* which occurs before a base with initial *i-*.

Examples:

<i>hadi</i>	'a ditch, trench, moat'	<i>mi-hadi</i>	'to dig'
<i>anaŋ'ă</i>	'advice, instruction'	<i>mi-anaŋ'ă</i>	'to study'
<i>[idină]</i>		<i>m-idină</i>	'to pour out, 'to go down'
<i>sambuŋ'ă</i>	'a seizure, a captive'	<i>mi-sambuŋ'ă</i>	'to borrow'

A special case of *mi-* derivation are *mi-an-* forms: *mi-an-* is prefixed to intransitive verbs which denote a movement towards a certain direction. *mi-an-* is apparently a combination of *mi-* + the location *a(n)-* (see below).

<i>[zera]</i> , <i>man-dzera</i>	‘to cast, throw down, to beat’	<i>mi-an-dzera</i>	‘to fall down’
<i>zena</i>	‘market’	<i>mi-an-zena</i>	‘to go to the market’

*maN-* *maN-* forms verbs, which are usually (but not always) transitive. It has two allomorphs:

*mam-* before labial consonants; the labials are deleted except, sometimes, for *v-* and *b-*

*man-* before other consonants and before vowels; of these other consonants, *k-*, *t-*, *ç-*, *s-* and *n-* are deleted, and *h-* becomes *-g-* or *ø*; *l-* becomes *-d-*; *r-* becomes *-dʳ-*, and *z-* becomes *-dz-*.

Examples:

<i>vuli</i>	‘things growing’	<i>mambuli</i>	‘to plant O’
<i>vulu</i>	‘hair, feather’	<i>mamulu</i>	‘to pluck off O’
<i>fintanã</i>	‘fish-hook’	<i>mamintanã</i>	‘to fish’
<i>[tau]</i>		<i>manau</i>	‘to do, act ; to think’
<i>[duru]</i>		<i>man-duru</i>	‘to burn O’
<i>lua</i>	‘vomit’	<i>mandua</i>	‘to vomit’
<i>rura</i>	‘saliva’	<i>mandʳura</i>	‘to spit’
<i>kaikiʳã</i>	‘a bite’	<i>manaikiʳã</i>	‘to bite O’
<i>[hantunã]</i>		<i>manantunã</i>	‘to hang, suspend O’
<i>hatakã</i>	‘request, thing begged’	<i>mangatakã</i>	‘to beg, ask for O’
<i>zaitʳa</i>	‘stitching’	<i>mandzaitʳã</i>	‘to sew O’
<i>çiri</i>	‘growth, sprouting’	<i>maniri</i>	‘to grow O’

*maha-* *maha-* forms transitive verbs which convey the notion of potentiality: the agent is able to perform the act, or, by extension, the agent succeeds in performing the act, or the agent causes the act. Examples:

<i>aru</i>	‘protection, rampart’	<i>maharu</i>	‘to be able to protect’
<i>ariʳã</i>	‘endurance’	<i>mahariʳã</i>	‘to last; to endure’
<i>[çiaru]</i>		<i>maha-çiaru</i>	‘to feel, be conscious; to remember’
<i>finariʳã</i>	‘happy, healthy, delighted’	<i>maha-finariʳã</i>	‘to please, render happy; beautiful’

*mana(N)-* It is unclear to what extent the meaning of this prefix differs from *maN-*; it is also unclear if there is a difference between *mana-* and *mana(N)-*.

## Examples:

<i>ariṭʳă</i>	‘endurance’	<i>manariṭʳă</i>	‘to be convalescent, get better’
<i>[vuaṭʳă]</i>		<i>manambuṭʳă</i>	‘to arrange, prepare O’
<i>vadi</i>	‘spouse’	<i>manambadi</i>	‘to marry’
<i>sitʳană</i>	‘healed, cured, recovered’	<i>manasiṭʳană</i>	‘to heal, cure O’

*manka-* This prefix forms transitive verbs with the meaning ‘to regard as [(what is expressed by) base]’, ‘to cause [base]’ or ‘to go to [base]’. The wordlist only contains a deverbal noun which is derived from a *manka-* verb, viz. *fankahalănă* ‘hatred’. The corresponding verb and its root are:

<i>hala</i>	‘hated, abhorred’	<i>manka-hala</i>	‘to hate, abhor O’
-------------	-------------------	-------------------	--------------------

*Reciprocal affixes.* Part of the above verb categories (excluding the *mi-* and *maha-* forms) have a reciprocal form, which is formed by substituting *mif-* for initial *m-*. One example occurs in the wordlist; it is derived from a *maN* form:

<i>tudzu</i>	‘met, come face to face’	<i>mifanudzu</i>	‘to meet’
--------------	--------------------------	------------------	-----------

Note: Most reciprocal forms have a causative counterpart, and all causative forms have a reciprocal form, resulting in ‘reciprocal causatives’ and ‘causative reciprocals’. These are not recorded in the wordlist.

*Causative affixes.* Causatives are formed by substituting *mamp-* for the initial *m-* of the above verbs or adjectives. Examples:

<i>mi-anaṭʳă</i>	‘to study’	<i>mampi-anaṭʳă</i>	‘to teach’
<i>mi-sambuṭʳă</i>	‘to borrow’	<i>mampi-sambuṭʳă</i>	‘to lend’
<i>man-antenă</i>	‘to hope, expect O’	<i>mampan-antenă</i>	‘to promise O’
<i>man-dʳeni</i>	‘to hear, perceive’	<i>mampan-dʳeni</i>	‘cause to hear, cause to perceive’

*vua-* *vua-* forms passive verbs in constructions where the agent is not mentioned. *vua-* is presumably derived from the noun *vua* ‘fruit; seed’ (Dahl 1951), and has largely replaced an earlier infix *-in-*. Examples:

<i>mana-melukă</i>	‘to condemn O’	<i>vua-helukă</i>	‘guilty’
<i>ini-ampanga</i>	‘to accuse O’	<i>vuampanga</i>	‘accused’
		<i>ni vuampanga</i>	‘the defendant’

Note: *vua-* is also used in *vua-luha-ni* ‘the first’.

*Other verbal affixes.* Other frequently occurring affixes indicate future or past tense, role-orientedness of the verb and non-controlledness. Tense is indicated by substituting initial *h-* (future) or *n-* (past) for *m-*. Role-orientedness of the verb is indicated by suffixing to the stem *-inã* (patient-orientedness), *-anã* (location-orientedness), *a-* (instrument-orientedness), or by deleting the *m-* of the agent-oriented form in combination with suffixation of *-anã* (orientedness towards an accompanying circumstance) with concomitant stress shift and morphophonemic change. Non-controlledness is marked with *tafa-*. These affixes do not occur in the wordlist. There are, however, patient-oriented and location-oriented verb forms in the list which are used as nouns. Compare the following forms:

<i>mi-tuetʻã</i>	‘to reside, dwell’	<i>tuer-anã</i>	‘place, position’
<i>mi-aritʻã</i>	‘to endure, sustain’	<i>aret-inã</i>	‘to be endured, sustained; disease’
<i>manasa</i>	‘to invite’	<i>asa-inã</i>	‘to be invited’,
		<i>nasainã,</i>	
		<i>(na)asa-inã</i>	‘invitee, guest’

The patient-oriented suffix *-ina* is also used in *çakuah-inã* ‘to have (=suffer from) the hiccoughs’.

### 3.2 Nominal affixes

*ha-*, *faha-*, *ha- -anã*, *faha- -nã* Nominal derivations on the basis of adjectives (whether or not prefixed with *ma-*) are formed by prefixing *ha-* or *faha-*, or by circumfixing *ha- -anã* or *faha- -anã*. The differences between these (often interchangeable) affixes are unclear. Examples:

<i>disu</i>	‘wrong’	<i>ha-disu-anã</i>	‘fault’
<i>lava</i>	‘long’	<i>ha-lava, halaʻvanã</i>	‘length’
<i>(ma-)nifi</i>	‘thin’	<i>(fa)hanifi, (fa)hanifisanã</i>	‘thinness, scarcity’
<i>ma-hia</i>	‘thin, lean’	<i>hahia, hahiazanã</i>	‘leanness’
<i>salama</i>	‘healthy’	<i>fahasalaʻmanã</i>	‘health’

Nominal affixes with *mp-*, *f-*, and *f- -anã*. Nominal derivations on the basis of verbs and their causatives are formed:

(1) by substituting *mp-* for the initial *m-* of the verb; the resulting form refers to agent. Examples:

<i>mi-anaṭʳă</i>	'to study'	<i>mpi-anaṭʳă</i>	'student, pupil'
<i>mi-andʳi</i>	'to wait, watch, herd'	<i>mpi-andʳi</i>	'guardian; herdsman'
<i>mangatakă</i>	'to ask, beg'	<i>mpangatakă</i>	'beggar'
<i>mamintană</i>	'to fish'	<i>mpamintană</i>	'fisherman'
<i>mampi-anaṭʳă</i>	'to teach'	<i>mpampi-anaṭʳă</i>	'teacher'
<i>mampakaṭʳă</i>	'to marry a woman'	<i>mpampakaṭʳă</i>	'bridegroom'

(2) by substituting *f-* for the initial *m-* of the verb, yielding an abstract noun or a noun referring to the instrument of the act.<sup>1</sup> Examples:

<i>mi-teni</i>	'to speak'	<i>fi-teni</i>	'way of talking'
<i>mi-vui</i>	'to row, paddle'	<i>fi-vui</i>	'oar, paddle'
<i>mamaki (vaki)</i>	'break'	<i>famaki</i>	'axe, cleaver'
<i>manamuri [hamuri]</i>	'steer a canoe'	<i>fanamuri</i>	'rudder'
<i>manutu</i>	'to pound'	<i>fanutu</i>	'pestle'

(3) by substituting *f-* for the initial *m-* of the verb and by suffixing *-ană* to the verb: the resulting form is an abstract noun, or, if it occurs attributively with another noun, a noun referring to goal, result, place, instrument of an act. Examples:

<i>mi-teni</i>	'to speak'	<i>fi-tenenană</i>	'talking'
<i>mi-asa</i>	'to work'	<i>fiasánă</i>	'tool'
<i>mangatakă</i>	'to ask, beg'	<i>fangatahană</i>	'request, petition'
<i>manduru</i>	'to burn O'	<i>fanduruană</i>	'setting fire; arson'
<i>mandʳi</i>	'to lie down'	<i>fandʳiană</i>	'bed'
<i>manenună</i>	'to weave'	<i>fanenumană</i>	'loom' <sup>2</sup>
<i>mampakaṭʳă</i>	'to marry a woman'	<i>fampakaram-badi</i>	'wedding' ( <i>vadi</i> 'spouse')
<i>manambadi</i>	'to marry' (< <i>vadi</i> )	<i>fanambadiană</i>	'marriage'
<i>manka-hala</i>	'to hate, abhor O'	<i>fankahaʳtană</i>	'hatred'

The honorific marker *ra-*

This prefix occurs with kinship-terms, proper names and respectful terms of address. It is also found in a number of animal names. It is probably

1. It sometimes also refers to the goal or result of the act, or to someone who performs the act as a habit.

2. *-m-* developed here as a result of progressive dissimilation. In other cases it is sometimes a retention, as in *velună* 'living, alive' and its patient-oriented form *velumină* 'to be quickened; to be alight (a fire)' cf. Maanyan *welom* 'living, alive'.

borrowed from Javanese (Adelaar in press). In many cases it has become fossilised. Examples:

<i>reni</i>	‘mother’ (< * <i>ra</i> + * <i>ina</i> )
<i>raha-lahi</i>	‘brother (of a male person)’ (< * <i>ra</i> + * <i>aka</i> + * <i>laki</i> )
<i>ra-fuçi</i>	‘a term of address for an old lady’ (< <i>ra</i> + <i>fuçi</i> white)
<i>ra-biṭʰu, biṭʰu</i>	‘rabbit’ (< English).

The location marker *a(n)-*

Adverbs and nouns referring to a place or position are marked with the prefix *a(n)-*. It is not clear whether there is a difference between prefixation of *a-* and *an-*. *an-* becomes *am-* when the prefixed word begins with a labial consonant. The initial consonant of the prefixed word changes in the same way as the initial consonant of the second component in a verb phrase, possessive construction, a reduplication or a compound. Examples:

<i>a-luha</i>	‘before’ ( <i>luha</i> ‘head’)
<i>am-badikã</i>	‘on the other side of’ ( <i>mamadikã</i> ‘to overturn’ ← <i>vadikã</i> )
<i>an-dilanã</i>	‘the loins’ ( <i>dilanã</i> ‘the slender middle part of a long thing’)
<i>an-Tanan-arivu</i> , also <i>Tanan-arivo</i>	‘thousand villages (name of the capital of Madagascar)’

Note: In many constructions this prefix seems to be fossilised, e.g. *a-varaṭʰã* ‘North’, *an-dʰefanã* ‘West’, *am-bu-ni* ‘up, above’. Locative prepositions often have *-ni* (originally the article of the following noun phrase) cliticised to them, as in *am-bu-ni*, and in *an-ila-ni* ‘beside’.

### 1. Introduction

---

---

The Acehnese language is spoken by approximately 2,000,000 people in the Special Region of Aceh, on the northern tip of Sumatra in Indonesia. Significant numbers of Acehnese speakers are also found in Medan, North Sumatra, and Malaysia.

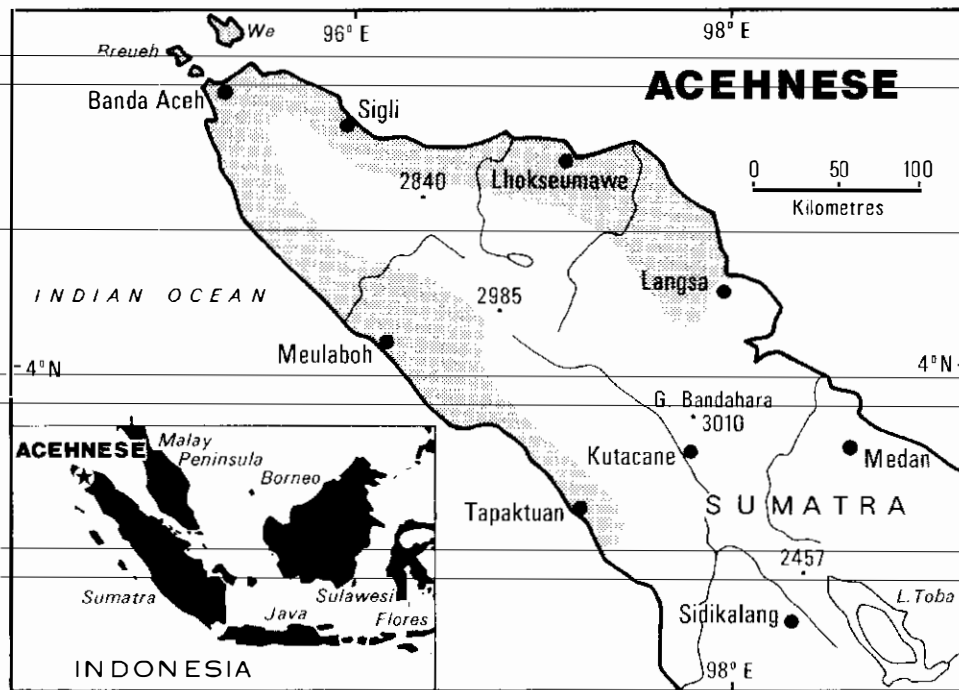

Acehnese has long been the dominant regional language in the area, and it shows relatively little influence from its immediate neighbours. These are Gayonese and Alas, spoken in the central mountains of Aceh, Tamiang, a variant of Malay spoken in the east, Kluet, spoken in the mountains of south Aceh, and Bahasa Jamèe, a variety of Minangkabau spoken on the west coast of Aceh.

Acehnese belongs to the Aceh-Chamic subgroup within Austronesian. Its nearest relatives are found in Kampuchea, Vietnam and Hainan. The members of this family are the linguistic remnants of the ancient Hindu kingdom of Champa, which was located on the coast of what is Vietnam today. The connection between Acehnese and the mainland Austronesian languages was first pointed out by Niemann (1891) in the last century. Further research has established a close genetic relationship: Cowan (1948, 1974, 1981, 1982, 1983), Shorto (1975, 1977), Collins (1975), Durie (1985a, 1989), but there is as yet no systematic reconstruction of Proto-(Aceh)-Chamic. Lee (1966) provides a reconstruction of Proto-Chamic, based on contemporary vernacular materials from the mainland languages collected by the Summer Institute of Linguistics, and this work was augmented by Burnham (1976). For lexical materials on the mainland Cham languages, see, for Rhade: Tharp – Buôn-yă (1980), Davias-Baudrit (1966), Louison (1964), Siêng (1979); for Cham: Kvoeu-Hor – Friberg (1978), Moussay et al (1971), Aymonier – Cabaton (1906); for Jarai: Lafont (1968); for Chru: Jràng et al (1977); for Roglai: Aw-i-hathe et al (1977); and also the microfiche material available from the Summer Institute of Linguistics. In addition Lee (1966) and Burnham (1976) provide a comparative Chamic

---

---

vocabulary. The major gaps in Lee and Burnham's reconstructions are the lack of data on Utset, a Chamic language spoken in Hainan (most of the available data is in Chinese, see Zheng 1981, Jueya and Zheng 1983, Zheng 1986, Dabai 1988, and also Haudricourt 1984, Benedict 1984), lack of reference to the Cham script and the ancient Cham inscriptions (for these see Aymonier 1906), and lack of reference to Acehnese (for this the primary source is Djajadiningrat 1934, but Kreemer 1931 is also useful because it lists synonyms and antonyms for many entries).

Map 17. Aceh language area

The Lee/Burnham reconstruction remains the most systematic comparative study of this Austronesian subgroup, and Burnham's augmented Proto-Chamic vocabulary provides the foundation for any further comparative work.<sup>1</sup>

The Acehnese lexicon includes borrowings from Mon-Khmer. These cover a wide range, including terms associated with kinship: *kumuən*

1 . It should be noted that preliminary evidence suggests that the mainland languages do not form a genetic grouping distinct from Acehnese: that is, the common ancestor of the mainland languages was probably a parent, not a sister, to Acehnese, but this has not been proved conclusively.

'nephew, niece', (*cu*)*cɔ*<sup>1</sup> 'grandchild', *ya* 'old man, ancestor'; hunting and foraging: *buəŋ* 'swamp', *cah* 'chop, clear forest', *drɔp* 'catch', *suət* 'bail water, usually to catch fish', *cəh* 'bite (of snake), peck', *cageə* 'bear', *let* 'drive, chase, hunt', *lhan* 'python', (*ci*)*cem* 'bird', *p(h)ɔ* 'to fly'; agriculture and animal husbandry: *cruəh* 'harrow', *wuə* 'stable', *jumponŋ* 'straw', *pət* 'pluck, pick (fruit)', *rət* 'graze'; various commonplace activities: *caŋ* 'hew, chop', *cəh* 'grind, pulverise', *dəm* 'stay overnight', *dəŋ* 'stand', *jep* 'drink', *kəh* 'scratch', *khun* 'say', *kuəh* 'dig', *klep* 'wink', *lhəm* 'drop', *mat* 'hold', *ŋiəŋ* 'see', *pəh* 'hit', *srah* 'wash', *tot* 'burn, light a fire', *toh* 'excrete', *uət* 'rub', *wɔə* 'return, go home' and other basic vocabulary items: *ba?* 'at, to (prep.)', *cut* 'small', *duə?* 'hungry', *lv* 'many', (*ja*)*wiə* 'left', *jeh* 'that', *gəp* 'other person, stranger', *bɛ?* 'don't' (particle), *kruəŋ* 'river'. These borrowings suggest such an intimate level of contact as might include intermarriage and shared participation in subsistence activities. This would appear to predate the break-up of the Proto-(Aceh)-Chamic family: most of the Mon-Khmer borrowings identified by Headley (1976) in Lee's (1966) reconstruction of Proto-Chamic have regular reflexes in Acehnese. The most plausible context for an early period of borrowing of this nature is an extended period of habitation by the Austronesians on the mainland before the ascendancy of the kingdom of Champa, thus before the 2nd century AD. The relationship between the powerful kingdom of Champa and the neighbouring Mon-Khmer tribes in the vicinity is not a likely context for these particular items to be borrowed from Mon-Khmer into Cham.

It has been argued that Acehnese shows evidence of influence from Western Mon-Khmer languages, including Mon, the Aslian languages of Malaya, and even the Nicobar languages (Cowan 1948, 1991, Collins 1975). If true, this suggests that the forebears of the Acehnese sojourned in Malaysia or what is now southern Thailand before coming to Sumatra.<sup>2</sup> To settle this question we need a full account of the sources of Mon-Khmer borrowings, and this task depends upon a more systematic reconstruction of both Proto-Aceh-Chamic and Mon-Khmer.

1. This is not a regular reflex of Malay *cucu* 'grandchild', for which one would normally expect Acehnese *cuco*. It is a regular cognate of Cham *tacɔ* (written *tacauw*), with Acehnese *ɔ* regularly from *\*au*. cf. Bahnar *səu/səu* 'grandchild'. Perhaps the Malay *cucu* is itself ultimately a borrowing from Mon-Khmer or even Austro-Asiatic. Note that the status of Proto-Malay *\*c* is not unproblematic within Austronesian, and one possible source for some words with *c* is Mon-Khmer (Adelaar 1988: 62). The question of ancient Mon-Khmer borrowings into Western Austronesian languages could prove to be a fruitful field of investigation.
2. Another possibility is that there may have been a Mon-Khmer language still in Sumatra at the time when the Acehnese were first established there.

A significant body of borrowings into Acehnese comes from Sanskrit. Some are very early and date at least from the appearance of Champa in the historical records around the 2nd century AD: they can be regularly reconstructed for Proto-Aceh-Chamic and are typically also found in Mon-Khmer languages, e.g. *juə* 'k.o. fishing net', *yoʔ* 'yoke', *buət* 'read, recite', *juət* 'become' (see Cowan 1983: 175). Some Sanskrit borrowings come via Malay (e.g. modern Acehnese *ato*, from Indonesian *atau*). Another major source of borrowings is Arabic. Most borrowings are derived directly from Arabic, but some come via literary Malay. Most Arabic and Sanskrit loans are characterised by a relatively narrow semantic domain, encompassing e.g. religion, the legal code, government, war, the arts and the sciences. In this respect the contrast with Mon-Khmer borrowings is striking.

For centuries there has been extensive borrowing from Malay, the traditional language of the royal courts and scholarship. Aceh was one of the centres in which Malay literature flowered at an early period and several important early Malay works come from Aceh. In many cases it is difficult or impossible to determine whether a term is borrowed or inherited from Proto-Aceh-Chamic. Some of the words in the list are certainly uncredited borrowings from Malay.

Borrowings on a lesser scale from other languages are also apparent in the list: Persian, Tamil, Portuguese, Dutch and English. In many cases these have come via Malay or Indonesian.

The term *Aceh* first appears in the historical record after 1500, when it was used to refer to the port kingdom of Banda Aceh. The diversity of Acehnese dialects in the valley of Greater Aceh, and in the vicinity of Daya on the west coast, suggests a period of habitation more ancient than this. Within Greater Aceh a major dialect division is between dialects of the uplands or *Tunong* and those of the lowlands, or *Barôh*. The valley of Pidie, to the east of Greater Aceh, is also a region of considerable dialect differentiation, but not to the extent of Greater Aceh and Daya. Other dialect areas, east of Pidie and south of Daya, are the result of migrations after 1500, associated with the political expansion of the kingdom of Aceh, and these dialect areas are consequently much more homogeneous.

The data for the word list are based upon the dialect represented by the lexical entries of Djajadiningrat (1934). This dialect was the variety spoken in the neighbourhood of Banda Aceh around the turn of the century, and presumably conforms most closely to the dialect of Teungkoe Moehammad Noerdin, who was the principal Acehnese scribe collaborator for the preparation of Djajadiningrat's dictionary. Moehammad Noerdin's native village was Gampông Pi, between Banda Aceh and the sea. Sometimes more

recent terms, typically borrowings, are provided in the list. The dialect of Djajadiningrat is innovative in that it has merged the back unrounded mid vowel /ʌ/ with /ɔ/: sometimes ɔ in the word list derives from an earlier \*ʌ, sometimes with an earlier \*ɔ. See Durie (1989) for details.

The most substantial studies of Acehnese grammar to date are Asyik (1972, 1987), Durie (1985b) and Sulaiman (1978, 1979). Snouck Hurgronje's path-breaking essays (1893, 1900) are of particularly high quality, although they have been superseded by later works. (The list of references below may be consulted for additional materials.) A standard orthography has been developed by a team of scholars at Universitas Syiah Kuala. This standard is reported in *Hasil Perumusan Seminar Pembinaan dan Pengembangan Bahasa Aceh*, a report on a seminar held in 1979. While this is a most sensible practical orthography for Acehnese, the vowels in particular can be difficult to interpret for those who are not already familiar with the language. Here we have used a transcription which is more transparent to someone who has some familiarity with standard phonetic conventions but no familiarity with Acehnese.

## 2. Summary of phonology

For a more detailed description of Acehnese phonology, see Durie (1985a).

### 2.1 Word stress and the structure of the word

Stress falls on the final syllable of the word. Clitics, which include prepositions and bound pronominal forms, are inherently unstressed.

Most Acehnese words are mono- or disyllabic. Words of three or more syllables are usually borrowed, or derived by affixation from mono- or disyllabic roots. e.g. *pu-miyup* 'bury' from *miyup* 'low' or *pancuri* 'thief' from Malay *pəncuri*.

A clear distinction can be made between the phonological structure of the stressed, final syllables of words on the one hand, and unstressed syllables on the other. Unstressed syllables have a smaller inventory of segments, with fewer combinatorial possibilities. There are also other differences. Stressed syllables are invariant under morphological affixation, and they are more stable in form across dialects. Even for individual speakers there may be some free variation in the form of unstressed syllables, e.g. *rukɔʔ* may vary with *rukɔ* 'cigarette', or *mulasah* with *munasah* 'village meeting house', but never for stressed syllables.

Stressed syllables have a possible structure C(C)V(C). The minimal structure is thus CV. For unstressed syllables the commonest and minimal structure is CV, but some unstressed syllables have the form CVC, where the final consonant is most commonly a nasal homorganic with the following consonant e.g. *gun.ta* ‘bell’.

## 2.2 Consonant inventory

Table 1. Consonants

	Bilabial	Alveolar	Palatal	Velar	Glottal
<b>Stops</b>					
voiceless	<i>p</i>	<i>t</i>	<i>c</i>	<i>k</i>	ʔ
voiced	<i>b</i>	<i>d</i>	<i>ɟ</i>	<i>g</i>	
<b>Fricatives</b>					
		<i>s</i>	( <i>ʃ</i> )	~	<i>h</i>
<b>Nasals</b>					
‘plain’	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
‘funny’	<i>mb</i>	<i>nd</i>	<i>nɲ</i>	<i>ŋg</i>	
<b>Laterals</b>					
		<i>l</i>			
<b>Trills</b>					
		<i>r</i>			
<b>Semivowels</b>					
	<i>w</i>		<i>y</i>		

*/s/* is a lamino-alveo-dental obstruent with a wide channel area (Durie 1985a: 12). To English speakers it sounds like a cross between their [s] and [θ]. In the dialect of the word list it is typically pronounced as a lamino-alveo-dental stop or affricate, but in other dialects it is a pure fricative. Even as a stop, this segment is perceptually quite distinct from *t*, which is apico-alveolar. Word-finally, */s/* is realised as a palatal fricative [ç].

*/ʃ/* is a palato-aveolar fricative similar to English [ʃ]. It has been introduced fairly recently and is mostly restricted to borrowings from Arabic.

*/r/* is a uvular approximant. In other dialects it is an apical trill, with a tapped allophone.

The “funny” nasals are of slightly longer duration than “plain” nasals, but the principal perceptual feature which distinguishes “funny” from “plain” nasals is that after a “funny” nasal the following vowel is not nasalised. Acehnese “funny” nasals correspond diachronically with prenasalised voiced stops in other Austronesian languages. The funny nasals are restricted to stressed

syllables. Other consonants can occur in both stressed and unstressed syllables.

Syllables may end only in: *p, t, ʔ, s, h, m, n, ŋ, y*. Final stops are unreleased.

In non-final syllables the range of final consonants is much more restricted. The nasals *m, n, ŋ* occur quite frequently before a following homorganic voiceless stop, e.g. *jaŋ-ka* ‘jaw’, but other finals only occur in compounds and the more recent loan words, and even here they tend in time to be dropped to conform to the preferred CV structure: e.g. Acehnese *pahlawan* (from Persian *pahlawân* via Malay *pahlawan*) naturally becomes *palawan* ‘warrior, hero’.

For an initial CC cluster of a stressed syllable, the following combinations are possible:

[oral stop or *l*] + *h*

[oral stop or *s*] + *r*

[velar, palatal or bilabial stop] + *l*

e.g. <i>lhəm</i>	‘drop’	<i>jrəh</i>	‘beautiful’
<i>phuwət</i>	‘chisel’	<i>srah</i>	‘wash’
<i>dhəə</i>	‘forehead’	<i>ʃluəŋ</i>	‘kick’
<i>triəŋ</i>	‘bamboo’	<i>bləə</i>	‘buy’

*sr* can correspond to *rh* in some dialects, and *ʃl* can correspond to *gl*. Thus *rhah* ‘wash’ and *gluəŋ* ‘kick’.

## 2.2 Vowel inventory

Table 2. Oral monophthongs

	Front	Rack	Rack
	Unrounded	Unrounded	Rounded
High	<i>i</i>	<i>u</i>	<i>u</i>
Mid-high	<i>e</i>	<i>ɤ</i>	<i>o</i>
Mid-low	<i>ɛ</i>		<i>ɔ</i>
Low		<i>a</i>	

*Table 3.* Nasal monophthongs

	Front unrounded	Back unrounded	Back rounded
High	<i>ĩ</i>	<i>ũ</i>	<i>ū</i>
Mid-low	<i>ẽ</i>		<i>õ</i>
Low		<i>ã</i>	

*Table 4.* Oral diphthongs

	Front unrounded	Back unrounded	Back rounded
High	<i>iə</i>	<i>uə</i>	<i>uə</i>
Mid-low	<i>ɛə</i>		<i>ɔə</i>

*Table 5.* Nasal diphthongs

	Front unrounded	Back unrounded	Back rounded
High	<i>ĩə</i>	<i>ũə</i>	<i>ūə</i>
Mid-low	<i>ẽə</i>		<i>õə</i>

In some dialects there is an additional mid-low back unrounded monophthong, in both oral and nasal forms: [ʌ] and [ã̃].

After the “plain” nasals only nasal vowels occur, and likewise after the “funny” nasals only oral vowels occur. For this reason vowel nasalisation after “plain” nasals is not indicated in the transcriptions: see the comment and examples in section 4 below.

All vowels can occur in stressed syllables. In unstressed syllables the inventory is much more restricted. The preferred vowels for unstressed syllables are: *i*, *u*, *a*, *u* and *ĩ*, *ũ*, *ã*, *ũ*. When a consonant sequence in a borrowed word has to be broken up for phonotactic reasons, the vowel inserted is usually *u* (or *ũ* after a nasal), e.g. Malay *pərlu* becomes Acehnese *puuruɬə* ‘need, duty’. Mid-low vowels also occur in unstressed syllables, but usually only in borrowed or compound words. There is a strong

diachronic tendency for these to change to one of the preferred vowels, e.g. *pɔrumɔh* 'wife' from *pɔ* 'owner' + *rumɔh* 'house' becomes *purumɔh* in many dialects.

High front vowels never follow *y* and likewise high back rounded vowels never follow *w*.

### 2.3 A phonological rule

A number of phonological rules can apply in Acehnese dialects to alter the forms of morphemes (Durie 1985a, section 3.3). However in the dialect reflected in the lists, only one rule is relevant:

Between two labials *w* is rounded to *u*; e.g. *pu* CAUSE + *blɔə* 'buy' gives *publɔə* 'sell'.

### 3. Sketch of derivational morphology

Like the mainland languages, Acehnese is an exclusively prefixing language. Even the infixes are pre-infixes into the first syllable of a word. The affixes are only summarised here. For a fuller account of their functions, see Asyik (1972, 1987), Durie (1985a). The main prefixes are:

*pu-* : derives causative verbs.

*tu-* : derives intransitive stative or non-volitional verbs from other verbs.

*mu-* : derives intransitive verbs with a wide range of functions.

The main infixes are:<sup>1</sup>

*-um-* : derives intransitive verbs from other verbs. The derived sense is habitual or durative.

*-un-* : derives nouns.

There are four formal strategies for attaching infixes:

- i) An infix may be inserted immediately after the first consonant of a disyllabic word. Thus *c-un-awĩəʔ* 'hook, n' from *cawĩəʔ* 'hook, vb'.

1. It is not obvious what should be the underlying form of these infixes. I have given the traditional analysis here, but a simpler account could treat all prefixes and infixes as consisting of a single consonant. The vowel is then epenthetic, inserted according to syllable structure constraints. This gives a more elegant account of the variable form of infixes, which may be *-VC-*, *CV-* or *-VCV-*.

- ii) For monosyllabic words the first consonant may be reduplicated, and the infix inserted after the first consonant. An additional *-u-* is required after the infix to satisfy syllable structure constraints. Thus *c-umui-cah* ‘clear forest, intrans’ from *cah* ‘clear forest, trans’.
- iii) For monosyllabic words beginning with a consonant sequence the infix may be inserted after the first consonant, with an additional *-u-* added after the infix, as in the previous case. Thus *c-umui-ruəh* ‘harrow, rake’ from *cruəh* ‘rake, harrow’. Most roots beginning with *lh-* form their derivatives as if they actually began with *sl-*. e.g. *s-umui-ləp* ‘dam, n’ from *lhəp* ‘dam, vb’. An exception is *lhə* ‘stamp, churn up with feet’ which forms a derivation *c-umui-lə* ‘stamp, intrans’. Likewise in dialects where *sr-* > *rh*, e.g. *s-umui-rah* ‘do washing, intrans’ from *rhah* ‘wash, tr.’ (< earlier *srah*).
- iv) For words of more than two syllables, and for roots beginning with certain consonants, a prefixed form applies. Thus *mu-puraŋuy* ‘to act, intrans’ from *puraŋuy* ‘to treat, trans’ and *nu-ŋuy* ‘apparel, something used’ from *ŋuy* ‘wear, use’.

#### 4. Special notes for interpreting the transcription

Words which are transcribed as beginning with a vowel actually have an initial glottal stop. e.g. *u* ‘coconut’ is actually /ʔu/.

The sequence of nasal + voiced stop is articulated as a nasal and may be regarded as a single segment (see Asyik 1972, Durie 1985a, 1987b). The principal perceptual contrast with ‘plain’ nasals is that after plain nasals the vowel is nasalised. These ‘nasalised’ vowels are identical to the distinctively nasal vowels which occur after oral consonants.

<i>buunda</i>	[buuna]	‘thing’
<i>buuna</i>	[bunã]	‘true’
<i>ŋgaŋ</i>	[ŋaŋ]	‘heron’
<i>mbon</i>	[mon]	‘dew’
<i>mɔn</i>	[mɔ̃n]	‘well’
<i>baŋay</i>	[baŋãy]	‘easy’
<i>muhãy</i>	[mũhãy]	‘expensive’
<i>ũət</i>	[ʔũət]	‘swallow’
<i>cumuət</i>	[cumũət]	‘boil, n.’

## 18. Toba Batak

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>K. A. Adelaar</i>
---------------	----------------------

Wordlist:	<i>P.W. J. Nababan – K. A. Adelaar</i>
-----------	--

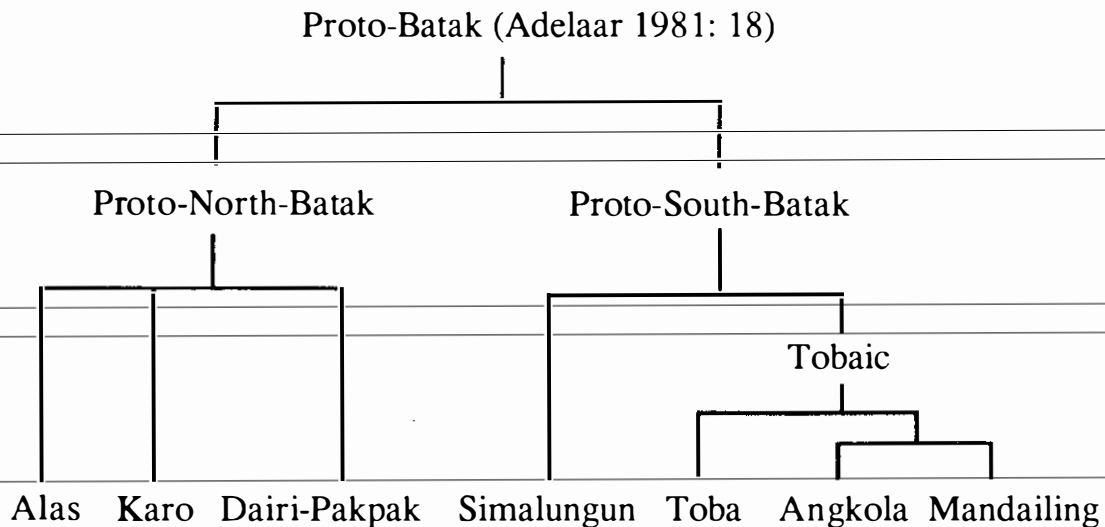

---

### 1. Introduction

---

Toba Batak belongs to the group of closely related Batak languages and dialects spoken by two and a half million people<sup>1</sup> in the central-northern part of Sumatra (in the province of North Sumatra). Toba Batak is spoken by more than a million people in the area southwest, south and east of Lake Toba (including Samosir Island; see map). It underwent much influence from Malay, Minangkabau and Sanskrit (see Gonda 1973). Malay was also the language through which Arabic, Portuguese and probably most of the Dutch influence was borrowed into Toba Batak. There are several local varieties of Toba Batak, Humbang or Toba na Sae (in the highlands south of Lake Toba) being the one used in the comparative wordlist (Nababan 1981: xviii).

---

The Batak languages were divided by Voorhoeve (1955) into a northern branch including Karo, Alas and Dairi-Pakpak, a southern branch including Toba, Angkola and Mandailing, and a third branch consisting of Simalungun

---

1. According to Foley (cf. Wurm – Hattori 1983: map 38).

---

or Timur, which occupies an intermediate position between Northern and Southern Batak.<sup>1</sup> Adelaar (1981), on the basis of phonological comparison, divides the Batak group into North Batak (including Karo, Alas<sup>2</sup> and Dairi-Pakpak) and South Batak; South Batak is divided into Simalungun on the one hand, and the Tobaic dialects (including Toba, Angkola and Mandailing) on the other. Finally, Tobaic splits up into a branch consisting of Toba, and a branch consisting of Angkola and Mandailing.

Map 18. Toba Batak language area

The northern branch, the southern branch and Simalungun are sufficiently distinct from each other to consider them separate languages. For a classification of Batak within the West-Malayo-Polynesian languages, see Nothofer (1986), who considers Batak, Sichule, Simalur, Nias, Mentawai and possibly Enggano as members of a single subgroup.

Within the context of West Indonesian languages, the Batak languages have a rather conservative grammatical typology. Toba Batak is grammatically and lexicographically well described. It has a rich morphology, and its

1. Foley (1983: map 38) distinguishes two more North Batak varieties: Singkil (spoken in the mountains behind Singkil in the extreme Southwest of Aceh Province) and Kluet (Southwest Aceh in the mountains beyond Tapaktuan).
- 3 The classification of Alas was still uncertain at the time Adelaar (1981) was published, but the material in Osra M. Akbar et al. (1985) confirms its inclusion in the Northern Batak group.

basic sentence structure is verb-initial and topic-final; the topic is agent or patient. The most extensive work on it was done by van der Tuuk, who wrote a sizeable grammar (1864, 1867), dictionary (1861b) and coursebook (1860-1861a-1862). His grammar, which contains much subsidiary information on Angkola, Mandailing and Dairi-Pakpak, has been translated into English (van der Tuuk 1971). Other grammatical and lexicographic studies on Toba Batak are Warneck (1906, with a revised edition in 1977), Tambunan (1977), Nababan (1981), Percival (1981), and Schachter (1984).

Other Batak languages are much less well documented. Pre-1955 sources on them are listed in Voorhoeve (1955). After 1955, dictionaries and grammatical sketches of most of them were published by the PPPB in Jakarta (see the *Linguistic Bibliography*). Of these, the Dairi-Pakpak - Indonesian dictionary by Tindi Radja Manik deserves special mention: allowing for the numerous typographical errors (which were not due to the compiler), it is of excellent quality. The following description of Toba Batak phonology and morphology is limited and geared to understanding the material in the wordlist: it is adapted from Nababan (1981).

### Toba Batak phonology

Table 1. Consonants

		Bilabial	Alveo- dental	Alveolar	Alveo- palatal	Velar	Glottal
Stops/affricates	vl	<i>p</i>	<i>t</i>		( <i>ç</i> )	<i>k</i>	
	vd	<i>b</i>		<i>d</i>	<i>ç</i>	<i>g</i>	
Fricatives				<i>s</i>			<i>h</i>
Nasals		<i>m</i>		<i>n</i>		<i>ŋ</i>	
Laterals				<i>l</i>			
Trills				<i>r</i>			
Semivowels		( <i>w</i> )			( <i>y</i> )		

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid-high	<i>e</i>	( <i>ə</i> )	<i>o</i>
Mid-low	<i>ɛ</i>		<i>ɔ</i>
Low		<i>a</i>	

The phonemes ə, ɔ̃, w and y are recent loan-phonemes.<sup>1</sup> They are not mentioned by van der Tuuk, who wrote his grammar a century earlier than Nababan. Nor does van der Tuuk make a phonemic distinction between higher and lower mid-vowels,<sup>2</sup> or between *h* and *k*. (In his analysis, *h* and *k* were still allophones, *h* occurring in initial and intervocalic position, and *k* occurring elsewhere.) These differences in description are a consequence of the rapid changes (mainly under the influence of Malay) which Toba Batak has undergone in the last century. Toba Batak does not have diphthongs.

Stress is contrastive. It is usually on the penultimate syllable, but it can also be on the last syllable or on the antepenultimate syllable. Stress falls on the last syllable of:

- (a) some attributively used underived bases;
- (b) a prefixed monosyllabic base;
- (c) names and terms of address when they are used as vocatives;
- (d) words containing the pronominal clitics *-m* (an allomorph of *-mu*, the 2nd pers. sing. pronoun) or *-'mu* (an allomorph of *-'muna*, the 2nd pers. plural or polite pronoun);
- (e) adjectives containing the suffix *-'an* (denoting comparative degree) or the suffix *-'hu* (denoting excessiveness);
- (f) certain deictics;
- (g) certain loanwords.

The basic word patterns of Toba Batak are:

CVC	(each C can be Ø)
CV(C)CVC	" " "
(CVC)(CVC)CV(C)CVC	" " "

Most word bases are of a CV(C)CVC pattern.

Consonant clusters occurring in inherited lexicon consist of:

- geminate *p, t, k, b, d, ʃ, m, n, l*
- lingual + stop, nasal or fricative;
- *s* + voiceless stop or nasal;

1. In non-recent loanwords, shwa became /o/, \*c became /s/, \*w became /o/ or was lost, and \*y was lost.
2. In a generalising way, the higher mid-vowels /e/ and /o/ occur before a voiced stop or /l/, whereas the lower mid-vowels /ɛ/ and /ɔ/ occur before a voiceless stop, fricative, nasal or /r/. Only in a few very marginal cases there seems to be a phonemic distinction between /e/ and /ɛ/.

- *k* + stop, nasal, liquid or *s*;
- *ŋ* + voiced stop, *r*, *s* or *n* (often occurring in originally doubled monosyllables).

Geminate stops have usually developed from clusters consisting of a homorganic nasal and a simple stop. *-dʃ-* and *-tʃ-* are geminate affricates which usually developed from *\*-ŋj-* and *\*-nc-* clusters. The only homorganic nasal + stop - cluster which did not develop into a geminate consonant is *-ŋg-* (< *\*-ŋg-*). *-kk-* may derive from *\*-ŋh-* or from *\*-kh-* (*h* and *k* were still allophones in the 19th century, see above). Two subsequent *s*'s are realised either as *-ss-* or as *-ts-*.

Clusters of *k + p*, *t, č, k, h, s* often arise at word boundaries where final *ŋ* meets initial *p, t, č, k, h, s*. On morpheme boundaries *r + l* become a geminated *l*.

Other manifestations of internal or external sandhi in the wordlist are clarified with segmented forms between brackets at the entries in question. A fuller treatment of sandhi is given in Nababan (1981: 59-60) and van der Tuuk (1971: 7-14): the rules differ in detail in different subdialects (and hence also in the various Toba Batak descriptions). Sandhi is only sporadically indicated in Roman script, and it is not indicated at all in the Batak script.

What follows here is a description in quite general terms of the affixes which occur in the Toba Batak comparative wordlist. Many aspects of Toba Batak morphology remain unclear, and it is often impossible to attribute a simple meaning and function to a particular affix. For instance, some of the noun-forming affixes are also markers of aspect and of syntactic role in verbal morphology (e.g. *-in-*, *-ən*, *-an*, and *ha-* *-an*). As these functions have no direct bearing on the material in the wordlist, they are not discussed here. Stress is indicated when it falls on the last syllable.

### Verb-forming affixes

*mar-* forms intransitive verbs from nouns and precatogorials (i.e. roots which only occur in derivations; they are indicated here between square brackets). Examples:

<i>[husəɾ]</i>		<i>mar-husəɾ</i>	‘move’
<i>[mɛam]</i>		<i>mar-mɛam</i>	‘play’
<i>adi-an</i>	‘rest; resting place’	<i>mar-adian</i>	‘rest’

*ma-* forms intransitive verbs from adjectives and precategorials.  
Examples:

<i>[dabu]</i>		<i>ma-dabu</i>	'fall; fallen'
<i>[tutuŋ]</i>		<i>ma-tutuŋ</i>	'burn, be burning'
<i>go'daŋ</i>	'a lot, much'	<i>ma-godaŋ</i>	'grow, have grown'

*um-* forms intransitive verbs from adjectives and precategorials. It has several allomorphs:

<i>(um)m-</i>	is prefixed before a vowel,
<i>un-</i>	is prefixed before initial <i>n</i> ,
<i>uŋ-</i>	is prefixed before initial <i>ŋ</i> ,
<i>m-</i>	is substituted for an initial labial; (in some cases, <i>up-</i> is prefixed to initial <i>p-</i> , and <i>ub-</i> is prefixed to initial <i>b-</i> )
<i>-um-</i>	is infixes after any consonant other than <i>p</i> , <i>b</i> or a nasal;

Examples:

<i>[ulak]</i>		<i>m-ulak</i>	'come back'
<i>[ago]</i>		<i>m-ago</i>	'disappear'
<i>[surut]</i>		<i>s-um-urut</i>	'retreat'
<i>pate</i>	'dead, finished'	<i>mate</i>	'die; extinguish, be over'

*tar-* forms verbs which convey the notion of 'non-controlledness'.

Examples:

<i>eo</i>	'urine'	<i>tar-eo-eo</i>	'urinate'
<i>[suladdit]</i>		<i>tar-suladdit</i>	'slip, slide'

Other affixes forming 'non-controlled' verbs are *-ɔn* and *-an*. They do so from nouns, adjectives and intransitive verbs. When suffixed to a noun denoting something disagreeable or uneasy, they form a verb with the meaning 'suffer from [noun]'. Examples:

<i>hɔdɔk</i>	'sweat'	<i>hɔdɔh-an</i>	'perspire'
<i>barsi</i>	'sneeze'	<i>barsi-ɔn</i>	'sneeze'
<i>dapɔt</i>	'found, got, obtained'	<i>dapɔt-an</i>	'find, get, obtain'
<i>ŋa'li</i>	'cold'	<i>ŋali-an</i>	'suffer from cold'

In some cases *-ɔn* or *-an* combine with reduplication of the first syllable of the root-morpheme, cf. *bonos* 'very sad' and *bonos-an*, *bo-bonos-an* 'be in doubt, at a loss'; [*heam*], *he-heam-ɔn* 'yawn, gape'.

*maN*<sub>1</sub>- is an intransitive verb marker occurring on precategorial bases. It should be distinguished from the homophonous *maN*<sub>2</sub>-, which is an inflectional prefix denoting agent-orientedness of transitive verbs (in the list, *maN*<sub>2</sub>- is not indicated). *maN*<sub>1</sub>- and *maN*<sub>2</sub>- have several allophones:

- if the base begins with a vowel or *g*, *maŋ* is prefixed;
- if the base begins with *r*, *l* or *n*, *maŋa* is prefixed;
- if the base begins with *d*, *ʃ* or *k*, *ma* is prefixed, and *d*, *ʃ*, *k* is geminated;
- if the base begins with *p* or *t*, *ma* is prefixed and a homorganic nasal is substituted for *p*, *t*;
- if the base begins with *b*, *mabb* or *mam* is prefixed, and *b* is eliminated;
- if the base begins with *h*, *makk* or *maŋ* is prefixed, and *h* is eliminated;
- if the base begins with *s*, *mats* or *man* is prefixed, and *s* is eliminated;
- if the base begins with *m*, *ma* or *mar* is prefixed (van der Tuuk 1971: 93);
- if the base begins with *ŋ*, *mar* is prefixed.

Examples:

<i>[hidɔp]</i>	<i>makkidɔp</i>	'blink'
<i>[ido]</i>	<i>maŋ-ido</i>	'beg, ask'
<i>[tutuŋ]</i>	<i>manutuŋ</i>	'burn, be burned'
<i>[ula]</i>	<i>maŋ-ula</i>	'work in field, be cultivating'

*pa*- forms transitive verbs (often with a causative meaning) from adjectives and intransitive verbs. Examples:

<i>ga'dʒaŋ</i>	'long'	<i>pa-gadʒaŋ</i>	'stretch O'
<i>m-ulak</i>	'come back, return, repeat'	<i>pa-ulak</i>	'give O back'
<i>mate</i>	'be dead'	<i>pa-mate</i>	'kill O'

*pa*- is sometimes combined with the transitivising suffix *-hɔn*, cf *[bɔtɔ]*, *um-bɔtɔ* 'know' and *pa-bɔtɔ-hɔn* 'announce'. It is also found on the basis of a transitive verb in combination with the suffix *-hɔn*, compare *tudu* 'point at O' and *tudu-hɔn* 'point at O, indicate O'.

*-hɔn* forms transitive verbs from roots belonging to various classes. Suffixation of *-hɔn* entails the following morphophonemic changes:

- final *t* or *n* + *hɔn* becomes *ttɔn*;
- final *p* or *m* + *hɔn* becomes *ppɔn*;
- final *k* or *ŋ* + *hɔn* becomes *kkɔn*;
- final *s* + *hɔn* becomes *ssɔn*;
- no morphophonemic changes are involved in other cases.

## Examples:

<i>use</i>	'poured out'	<i>use-hən</i>	'pour O'
<i>ma-dabu</i>	'fall(en)'	<i>dabu-hən</i>	'drop O'
<i>[taŋi]</i>		<i>taŋi-hən</i>	'hear O, listen to O'
<i>sala</i>	'mistake, error'	<i>sala-hən</i>	'blame O'
<i>sə-ada</i>	'there is no(t)'	<i>səada-hən</i>	'deny O'
<i>pεak</i>	'lie'	<i>pεakkən</i>	'put, lay, O'
<i>dais</i>	'rub, smear on O'	<i>daissən (tu)</i>	'rub, wipe O (on)'

*-i* forms transitive verbs from adjectives, intransitive and transitive verbs, precategoryals and nouns. The resulting verbs are either 'location-oriented' (in a rather broad sense of the term), or they have an iterative aspect. Examples:

<i>mar-dalan</i>	'walk'	<i>dalan-i</i>	'walk on O'
<i>ihut (tu)</i>	'following'	<i>ihut-i</i>	'follow O'
<i>dənək</i>	'close-by'	<i>dənək-i</i>	'approach O'
<i>tutup</i>	'covered, closed'	<i>tutup-i</i>	'cover, close, O'
<i>olo</i>	'want to; yes'	<i>olo-i</i>	'obey'
<i>[urup]</i>		<i>urup-i</i>	'help O'
<i>mula</i>	'beginning'	<i>mula-i</i>	'begin O'

## Noun-forming affixes

*paN-* forms nouns from transitive verbs (allowing for its initial consonant, it has the same allomorphs as the active voice marker *maN<sub>2</sub>-*). These nouns refer to the actor or (sometimes) the instrument of the act denoted by the transitive verb base. Examples:

<i>takko</i>	'steal O'	<i>panakko</i>	'thief'
<i>ido</i>	'beg, ask for, O'	<i>paŋ-ido-ido</i>	'beggar'
<i>urup-i</i>	'help O'	<i>paŋ-urup-i</i>	'servant'
<i>masakkən</i>	'use for cooking'	<i>par-masak</i>	'(what is used in cooking =) spices'

*par-* has the same function as *paN-*, but it occurs on intransitive verbs marked with the *mar-*. (These intransitive verbs may in turn be derived from a noun or precategoryal.) Examples:

<i>mar-dekke</i>	'catch fish'		
( <i>dekke</i>	'a fish')	<i>par-dekke</i>	'fisherman'

*mar-tamue* 'have a guest'  
(*tamue* 'guest')      *par-tamue* 'host'

*mar-tiga-tiga* 'trade'  
(*tiga-tiga* 'trade goods')      *par-tiga-tiga* 'merchant'

*paN-* *-an* and *paN-* *-ɔn* are circumfixed to transitive verbs. Examples:

*bunu* 'kill O'      *pamunuɔn* 'murder'  
*gagat* 'eat (of herbivores)'      *paŋ-gagat-an* '(place of) eating',  
cf. (*ladaŋ*)*paŋ-gagat-an* 'pasture'

*par-* *-an* and *par-* *-ɔn* are circumfixed to verbs prefixed with *mar-* (which prefix is deleted). They form abstract nouns or nouns referring to the place of the act denoted by the *mar-* verb. Examples:

*mar-bagas* 'be married'  
*par-bagas-ɔn* 'marriage, wedding'  
*mar-dɔppak* 'resist, face'  
*par-dɔppah-an* 'forehead'  
*mar-musu* 'wage war'  
*par-musu-an, par-musu-ɔn* 'war, battle'  
*mar-gɔlaŋ* 'have or wear a copper bracelet'  
*par-gɔlaŋ-an* '(place of the bracelet =) wrist'

*-an* is suffixed to adjective, transitive and intransitive verbs, and it forms nouns referring to the place or result of the act, or to the act itself as a fact ('abstract noun'). Examples:

*bagi* 'divide (O)'      *bagi-an* 'part, piece'  
*ba'gas* 'deep'      *bagas-an* '(the) inside'  
*mɔdɔm* 'sleep'      *pɔdɔm-an* 'bed'  
*maŋan* 'eat'      *paŋan-an* 'plate'  
*uhum* 'judge (O)'      *uhum-an* 'judgement; punishment'  
*suan* 'plant (O)'      *suatsuanan* 'a plant'

*-ɔn* is suffixed to transitive verbs, and it forms nouns which often have the meaning 'that what is to be verb-ed'. It alternates with *-an* when affixed to verbs which take the suffix *-i*. Examples:

*maŋan* 'to eat'      *paŋan-ɔn* 'food'  
*pele* 'worship, idolise'      *pele-ɔn* 'idol'  
*ihut-i* 'follow O'      *ihut-an* 'leader; leading gong in  
Batak orchestra'

*ha-* *-an* and *ha-* *-ɔn* form abstract nouns from of adjectives and dynamic intransitive verbs. Examples:

<i>pitʔɔr</i>	‘correct, honest’	<i>ha-pittɔr-an</i>	‘honesty’
<i>ma-lɛ</i>	‘be hungry’	<i>ha-lɛ-ɔn</i>	‘famine’
<i>mɔnaŋ</i>	‘win’	<i>ha-mɔnaŋ-an</i>	‘victory’
<i>talɔ</i>	‘be defeated’	<i>ha-talu-ɔn, ha-talu-an</i>	‘defeat’

The verbal prefix *ni-* (*-in-* after consonants other than *d*, *r*, *l* or a nasal), which denotes patient-orientedness, also forms nouns which are patient-oriented in meaning. Examples:

<i>pahan</i>	‘feed, rear (cattle)’	<i>p-in-ahan</i>	‘livestock’
<i>pɔppar</i>	‘have O (as descendants)’	<i>p-in-ɔppar</i>	‘descendants’

Lexical reduplication: by reduplicating a root (usually a noun or an adjective) nouns are formed denoting something which resembles, or has a lot in common with, the root. Examples:

<i>haɛ</i>	‘quarter part of an animal’	<i>haɛ-haɛ</i>	‘thigh’
<i>ha'ba</i>	‘voluminous but not heavy’	<i>haba-haba</i>	‘storm’
<i>luga</i>	‘oar’	<i>luga-luga</i>	‘paddle’

Other nominal constructions:

Nominal phrases introduced by the personal article *si* often have a lexicalized meaning. Examples:

<i>ma-tua</i>	‘old’	<i>si ma-tua</i>	‘parents-in-law’	
<i>boan barita</i>	‘convey a message’	<i>si boan barita</i>	‘(the) messenger’	
[ <i>bagur</i> ]		<i>si bagur</i>	‘frog’	
<i>gadʒaŋ</i>	‘long’	<i>obuk</i>	‘hair’	
<i>tuak</i>	‘palm wine’	<i>si gadʒaŋ obuk</i>	‘the long-haired one’	
	<i>loba</i>	‘bee’	<i>si tuak ni loba</i>	‘honey’

*na* links an attribute to the head of a noun phrase, and it links a relative clause to its head. *na* can also form a noun phrase in itself (the original head of which is, as it were, deleted). Examples:

<i>ma-tua</i>	‘old’	<i>na tua-tua</i>	‘parents’
<i>mar-baʒu</i>	‘wear a jacket’	<i>na mar-baʒu</i>	‘young woman’

Wordlist:	<i>C. Anwar – K. A. Adelaar</i>
-----------	---------------------------------

---

### 1. Introduction

---

Minangkabau is the language of the second largest ethnic group in Sumatra.<sup>1</sup> The Minangkabaus traditionally live in an area which covers the province of West Sumatra and extends over its borders to Padang Sidempuan in the North, to Bangkinang and Kuantan to the East, and to Mount Kerinci and Mount Seblat in the South.

The Minangkabaus number 6,5 million people (Moussay 1981: 1). About half of them live in their native land; the others form colonies elsewhere in Sumatra (along the Northwest coast and in the Sumatran provinces of Riau, Jambi and Bengkulu), in peninsular Malaysia (Negeri Sembilan), in the major cities of Java (Jakarta, Bandung, Surabaya) and elsewhere (Moussay 1981: 3).

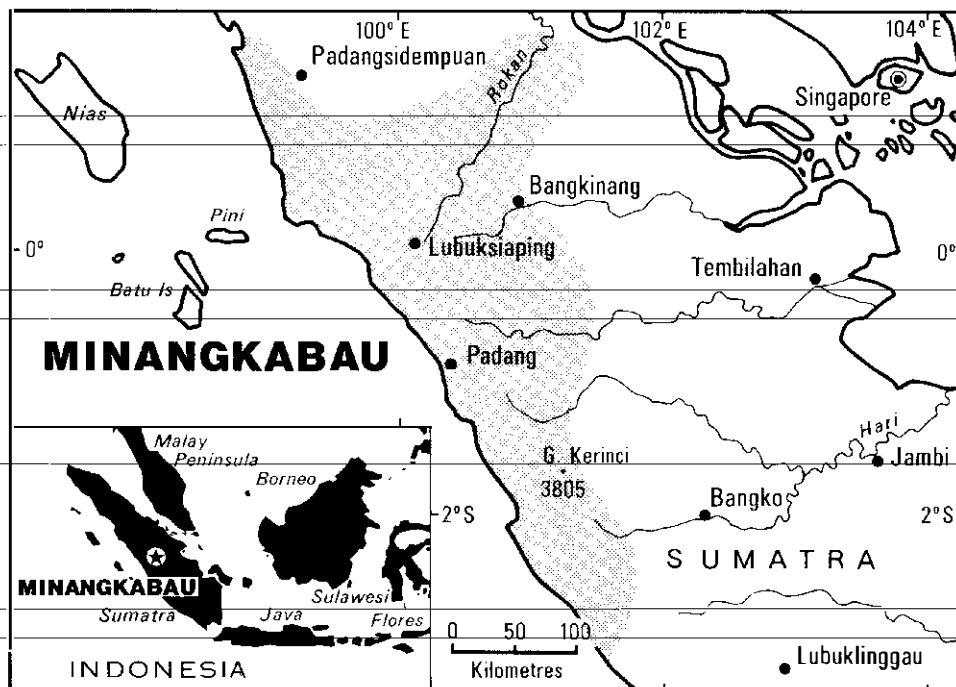

Minangkabau and (Standard) Malay both belong to the Malayic linguistic subgroup,<sup>2</sup> which in turn belongs to the West-Malayo-Polynesian branch. Traditionally, four major Minangkabau dialects are distinguished (Tanah Datar, Limapuluh Kota, Agam and Pasisir), but Tamsin Medan's dialect study (n.d.) shows a much more variegated picture. The dialect of the city of Padang is the most prestigious variety of Minangkabau: it is becoming the major urban Minangkabau dialect, and it is the lingua franca among speakers of different dialect backgrounds (Moussay 1981: 9-12).

Minangkabau as a linguistic concept causes a number of problems. There is a large culturally defined Minangkabau area with several Malayic speech forms sharing in varying degrees the phonological developments which are generally recognized as typical for that area. These developments are mainly

- 
1. The Malays, who live in South and East Sumatra, being the largest group.
  2. Other members of this subgroup are among others Banjarese, Urak Lawoi', Kerinci, Jakarta Malay, Bacan Malay and the "Malayic-Dayak" languages (Iban, Mualang, Selako, Kendayan) (Adelaar 1985). Rejang and Lampung (Sumatra) do not belong to it.
-

changes in the vowels of final syllables and mergers of final consonants. Most of these developments are not only found in the Minangkabau area, but

Map 19. Minangkabau language area

in many peninsular Malay and Sumatran Malay dialects as well. There is consequently no linguistic criterion for delimiting the Minangkabau dialect area from neighboring Malayic areas, nor does it show sufficient linguistic homogeneity vis-à-vis these neighboring areas to consider it a separate language area. What there is, is a Malayic dialect chain covering the Malay, Minangkabau and Kerinci<sup>1</sup> cultural areas, whereby several cultural centres in this area identify themselves linguistically with the local speech form and with its configuration of isoglosses. The phonological changes in Minangkabau make it *prima facie* hard to trace it back to Proto-Austronesian or to see its close relationship with Malay. The following chart shows the sound changes from Proto-Austronesian to Proto-Malayic, and from Proto-Malayic to Minangkabau and Malay.

1. Spoken around Mount Kerinci in the western part of the province of Jambi. Kerinci has a lot of phonological history in common with Minangkabau, but it underwent some later phonological and morphological changes which make it quite different from the latter (Prentice and Hakim Usman 1978; Steinhauer and Hakim Usman 1978).

Table 1. Sound changes from Proto-Austronesian to Proto-Malayic, Minangkabau and Malay

PAN	PM	MIN	ML
<i>a</i>	<i>a</i>	<i>a, o, e</i>	<i>a</i>
<i>ə</i>	<i>ə</i>	<i>a, o, e</i>	<i>ə, a / _C#</i>
<i>i, -iw, -əy, -uy</i>	<i>i</i>	<i>i, e, i<sup>2</sup></i>	<i>i, e</i>
<i>u, -əw</i>	<i>u</i>	<i>u, o, u<sup>2</sup>, uy</i>	<i>u, o</i>
<i>-ay</i>	<i>-ay</i>	<i>-ay</i>	<i>-ay</i>
<i>-aw</i>	<i>-aw</i>	<i>-aw</i>	<i>-aw</i>
<i>p</i>	<i>p</i>	<i>p, -<sup>?</sup></i>	<i>p</i>
<i>t, T, C</i>	<i>t</i>	<i>t, -<sup>?</sup></i>	<i>t</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>k</i>	<i>k</i>	<i>k, -<sup>?</sup></i>	<i>k</i>
<i>b</i>	<i>b, -p</i>	<i>b, -<sup>?</sup></i>	<i>b, -p</i>
<i>d, j</i>	<i>d, -t</i>	<i>d, -<sup>?</sup></i>	<i>d, -t</i>
<i>D</i>	<i>d, -r</i>	<i>d, -∅</i>	<i>d, -r</i>
<i>z, Z</i>	<i>j</i>	<i>j</i>	<i>j</i>
<i>g</i>	<i>g, -k</i>	<i>g, -<sup>?</sup></i>	<i>g, -k</i>
<i>m</i>	<i>m</i>	<i>m, n</i>	<i>m</i>
<i>n</i>	<i>n</i>	<i>n (ñ)</i>	<i>n (ñ)</i>
<i>ŋ</i>	<i>ŋ</i>	<i>ŋ</i>	<i>ŋ</i>
<i>ñ</i>	<i>ñ</i>	<i>ñ</i>	<i>ñ</i>
<i>l</i>	<i>l</i>	<i>l, -∅</i>	<i>l</i>
<i>r, R</i>	<i>r</i>	<i>r, -∅</i>	<i>r</i>
<i>s</i>	<i>s</i>	<i>s, -h</i>	<i>s</i>
<i>S, H, ?</i>	<i>∅ (?)</i>	<i>∅</i>	<i>∅</i>
<i>q</i>	<i>h</i>	<i>∅, -h</i>	<i>h- / ∅-, -h- / -∅-, -h</i>
<i>w</i>	<i>∅-, -w-</i>	<i>∅-, -w-</i>	<i>∅-, -w-</i>

Proto-Austronesian consonant-clusters in Proto-Malayic were reduced to their second component, or (if the first component was a nasal) to a homorganic nasal + stop cluster. Some of the Proto-Austronesian phonemes (viz. \*z, \*g, \*T, \*c, \*ñ, \*r) are problematic.

The number of changes from Proto-Malayic to Minangkabau are manifold, but most of them can be summarised by a small number of regular sound rules:

(not chronologically ordered):

- \*n incidentally became ñ in the environment of *i*, cf. Proto-Malayic \*kəniŋ ‘(eye-)brow’ > kañi<sup>2</sup>ŋ

- non-final *\*h* was generally lost, cf. Proto-Malayic *\*hidup* ‘to live’ > *iduy?*
- final *\*a* became *o*, cf. Proto-Malayic *\*mata* ‘eye’ > *mato*
- high vowels were occasionally lowered to mid-vowels, cf. Proto-Malayic *\*hituŋ* ‘to count’ > *etoŋ*

(chronologically ordered):

I. *\*ə* became *\*a*, (first in last syllables, later on elsewhere)

II. after high vowels, final labials merged with dentals:

*\*(u,i)p, \*(u,i)t* → *\*(u,i)t*

*\*(u,i)m, \*(u,i)t* → *\*(u,i)n*

III. final syllable vowels were coloured by following consonants:

*\*-a(t,s)* → *\*-e(t,s)<sup>1</sup>*

*\*-u(t,s)* → *\*-uy(t,s)*

*\*-i(t,s)* → *\*-i(t,s)*

*\*-ap* → *\*-op*

*\*-u(k,ŋ,h,l,r)* → *\*u<sup>o</sup>(k,ŋ,h,l,r)*

*\*-i(k,ŋ,h,l,r)* → *\*i<sup>o</sup>(k,ŋ,h,l,r)*

VI. final stops and fricatives were reduced to glottals, and final linguals disappeared in absolute-final position:

*\*-p, \*-t, \*-k* → *-ʔ*

*\*-h, \*-s* → *-h*

*\*-l* → *∅* (*-l* on morpheme boundaries)

*\*-r* → *∅* (*-r* on morpheme boundaries)

Examples:

Proto-Malayic	rule I	rule II	rule III	rule IV	Padang-Minangkabau
<i>*əmpat</i> >	<i>*ampat</i>	<i>*ampat</i>	<i>*ampet</i>	<i>ampeʔ</i>	‘four’
<i>*hatəp</i>	<i>*(h)atap</i>	<i>*(h)atap</i>	<i>*(h)atop</i>	<i>atoʔ</i>	‘roof’
<i>*hidup</i>	<i>*(h)idup</i>	<i>*(h)idut</i>	<i>*(h)iduyt</i>	<i>iduyʔ</i>	‘live’
<i>*mulut</i>	<i>*mulut</i>	<i>*mulut</i>	<i>*muluyt</i>	<i>muluyʔ</i>	‘mouth’
<i>*bəlum</i>	<i>*balum</i>	<i>*balun</i>	<i>*balun</i>	<i>balun, alun</i>	‘not yet’
<i>*atas</i>	<i>*atas</i>	<i>*atas</i>	<i>*ates</i>	<i>ateh</i>	‘above’
<i>*tikus</i>	<i>*tikus</i>	<i>*tikus</i>	<i>*tikuys</i>	<i>tikuyh</i>	‘mouse’

1. This change must have taken place via a intermediate stage where *\*a* diphthongised to *\*ay*. Recent loanwords sometimes underwent this halfway development, cf. *siayʔ* ‘healthy’ (< Arabic *ṣiḥḥat* ‘health’); *talayʔ* ‘late’ (< Dutch *te laat* ‘id.’).

* <i>hituŋ</i>	*( <i>h</i> ) <i>ituŋ</i>	*( <i>h</i> ) <i>ituŋ</i>	*( <i>h</i> ) <i>itu<sup>ʔ</sup>ŋ</i>	<i>itu<sup>ʔ</sup>ŋ</i>	‘count’
* <i>bibir</i>	* <i>bibir</i>	* <i>bibir</i>	* <i>bibi<sup>ʔ</sup>r</i>	<i>bibi<sup>ʔ</sup></i>	‘lip’
* <i>putih</i>	* <i>putih</i>	* <i>putih</i>	* <i>puti<sup>ʔ</sup>h</i>	<i>puti<sup>ʔ</sup>h</i>	‘white’
* <i>pukul</i>	* <i>pukul</i>	* <i>pukul</i>	* <i>puku<sup>ʔ</sup>l</i>	<i>puku<sup>ʔ</sup></i>	‘strike’
* <i>tarik</i>	* <i>tarik</i>	* <i>tarik</i>	* <i>tari<sup>ʔ</sup>k</i>	<i>tari<sup>ʔ</sup></i>	‘pull’
* <i>k<sup>ʔ</sup>luh</i>	* <i>kaluh</i>	* <i>kaluh</i>	* <i>kalu<sup>ʔ</sup>h</i>	<i>kalu<sup>ʔ</sup>h</i>	‘sigh, complain’

Tamsin Medan’s study (n.d.) shows that some Minangkabau dialects underwent only part of the above sound changes, whereas other dialects underwent further changes beyond the ones enumerated here.

Compared to Minangkabau, the sound changes from Proto-Malayic to (Standard) Malay were rather minimal:

- antepenultimate vowels merged to ə
- last syllable \*ə became a
- \**n* sporadically became ñ in the environment of *i*
- non-final \**h* was sometimes lost.

Within the context of the study of Austronesian language studies Minangkabau is reasonably well described, although all major works are in Dutch, French or Indonesian. There are two grammars, of which the one by Moussay (1981) is more complete and up to date; the one by van der Toorn (1899) is still valuable for its examples from classical Minangkabau literature. There are two dictionaries (van der Toorn 1891 and Thaib 1935) and a third one (by Moussay) is about to appear. There is a thoroughgoing dialect study made by the late Tamsin Medan, which is kept in manuscript form at the Pusat Pembinaan dan Pengembangan Bahasa in Jakarta. The linguistic history of Minangkabau is treated in Adelaar (1985). Other sources on Minangkabau language and literature are summarised in Voorhoeve (1955), Moussay (1981), and in the *Linguistic Bibliography*.

## 2. Minangkabau phonology

Stress is predictable and falls on the penultimate syllable of a root. There are no other supra-segmental features with phonemic relevance.

The basic word patterns of Minangkabau are: CVC, CV(C)CVC and (CV(C)) (CV(C))CV(C)CVC. Most roots have a CV(C)CVC-pattern.

The last C of a root can only be a nasal (other than ñ), a glottal or Ø. The other Cs can be a single consonant, Ø or a cluster; clusters consist of a

homorganic nasal + stop, or *n* + *s*. Diphthongs only occur in final syllables.  
 ? only occurs in root-final position.<sup>1</sup>

Table 2. Minangkabau consonants

		Bilabial	Dental	Palatal	Velar	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>	
Fricatives			<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals			<i>l</i>			
Trills			<i>r</i>			
Semivowels		<i>w</i>		<i>y</i>		

Table 3. Minangkabau vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>ā</i>	

Diphthongs *i<sup>2</sup>, u<sup>2</sup>, uy, ay, aw*

Morphophonemic alternations

Prefixation of *ma(N)-* or *pa(N)-* (*-an*) brings about the following changes:

- 1) homorganic nasal substitution for initial *p, t, k*;
- 2) palatal nasal substitution for initial *s*;
- 3) homorganic nasal accretion before initial voiced stops and *č*;  
 (palatalisation of the nasal before *ǰ* and *č* is not indicated in the official Minangkabau orthography nor in the comparative wordlist);
- 4) in other cases, only *ma-/pa-* (*-an*) is prefixed

Examples:

<i>[pili<sup>2</sup>h]</i>	<i>mamili<sup>2</sup>h</i>	'to choose'
<i>tutuy<sup>2</sup></i>	'closed' <i>manutuy<sup>2</sup></i>	'to close'

1. Since other voiceless stops not occur in final position, ʔ could be interpreted as an allophone of one of them: Moussay (1981) treats ʔ as an allophone of *k*.

<i>kapu</i> <sup>ʔ</sup>	‘chalk’	<i>maŋapu<sup>ʔ</sup>ri</i>	‘to plaster’
[ <i>sasa</i> ]		<i>mañasa</i>	‘to be sorry, regret’
<i>badi</i> <sup>ʔ</sup>	‘gun’	<i>sa-pambadi<sup>ʔ</sup>ran</i>	‘the distance of a gunshot’
[ <i>daŋa</i> ]		<i>mandaŋa</i>	‘to hear’
[ <i>ʃamu</i> ]		<i>mañʃamu</i>	‘to treat, entertain’
		<i>pañʃamu</i>	‘host’
[ <i>gandin</i> ]		<i>maŋgandin</i>	‘thrash, flog’
		<i>paŋgandin</i>	‘s.th. to flog with’
[ <i>čari</i> ]		<i>mañčari</i>	‘look for, seek’
		<i>pañčarian</i>	‘livelihood, business’
<i>mali</i> <sup>ʔŋ</sup>	‘thief’	<i>mamali</i> <sup>ʔŋ</sup>	‘steal’
<i>itam</i>	‘black’	<i>maitam</i>	‘to become black’
<i>anam</i>	‘six’	<i>maanamkan</i>	‘make s.th. into six’

When the suffixes *-i* (transitiviser) or *-an* (transitiviser/nominaliser) are suffixed to a root ending in *-a*, *-u*<sup>ʔ</sup> or *-i*<sup>ʔ</sup>, a lingual appears on morpheme boundaries; this lingual usually (but not always) corresponds to the same lingual in Proto-Malayic; examples:

<i>lapa</i>	‘hungry’	<i>kalaparan</i>	‘famine’
<i>mañasa</i>	‘to be sorry’	<i>mañasali</i>	‘to be sorry about s.th.’
<i>badi</i> <sup>ʔ</sup>	‘gun’	<i>sa-pambadi</i> <sup>ʔ</sup> <i>lan</i>	(sometimes <i>sa-pambadi</i> <sup>ʔ</sup> <i>ran</i> ) ‘the distance of a gunshot’

In some cases suffixation of *-i* or *-an* entails substitution of *-s-* for *-h-*; example:

<i>manih</i>	‘sweet’	<i>manisan labah</i>	‘honey’
--------------	---------	----------------------	---------

Note: In some Minangkabau sub-dialects suffixation of *-i* or *-an* entails substitution of *p*, *t* or *k* for *-ʔ*, cf. *saki*<sup>ʔ</sup> ‘ill’ and *pasaki*<sup>ʔ</sup>*an*, *pasakitan* ‘difficulty, impediment’ (van der Toorn). In other sub-dialects, a *p*, *t* or *k*, appear after final *-ʔ*, cf. *maikuy*<sup>ʔ</sup> ‘to follow’ and *paikuy*<sup>ʔ</sup>*tan* ‘without an opinion of one’s own’.

### 3. Inventory of the affixes occurring in the wordlist

Verbal affixes:

- ma(N)-*
- 1) forms intransitive verbs
  - 2) is prefixed to transitive verbs to mark agent-orientedness (object-orientedness is marked with *di-*)

*(mam)pa-* transitiviser

*-i* a transitiviser which is location-oriented, or which adds the notion of multiple action or plurality of subject or object

*-an/-kan* transitiviser; when suffixed to transitive verbs, it is an object selector yielding among others causatives, recipient-oriented verbs or instrument-oriented verbs

*ba-/(bar-)* forms intransitive verbs (with nouns, it conveys the meaning of have/take/use/wear [noun])

*ba- -an* forms intransitive verbs, adds the notion of reciprocity, multiple action or diffuseness

*basa-* forms intransitive verbs, adds the notion of reciprocal action or multiple action (with a plural subject)

*ta-* is prefixed to verbs and denotes that the subject commits, or is affected by, non-controlled action

Nominal affixes:

*pa(N)-* is prefixed to verbs which take *ma(N)-*; it forms nouns referring to agent; it also forms nouns denoting the habit of doing [base] and nouns referring to the instrument with which an act is performed

*pa- (par-)* is prefixed to verbs which take *ba-* or *(mam)pa-*; the resulting forms have meanings which are similar to those of the *pa(N)-* derivations

*pa(N)- -an, pa- -an* and

*par- -an* form abstract nouns or nouns referring to goal of an act, instrument of an act, or to the place where an act takes place

*-an* on the basis of an adjective, the derivation denotes 's.th. that has the quality of [adjective]'; on the basis of a verb, the derivation refers to the result, goal or instrument of the act, or to the place where the act is performed

*ka- -an* derives abstract nouns from intransitive verbs; when it is derived from adjectives, it forms nouns referring to the quality as such of [adjective]

*sa-* denotes unitary occurrence of the noun to which it is prefixed (its use often entails a notion of indefiniteness)

Note: The personal article *si* [+ personal name] is used to refer to people with whom one has familiar contact. When it precedes an adjective or verb, it usually forms a nickname referring to a characteristic or habit expressed by [adjective/verb]. But it is also used to form noun phrases with a more general

meaning, which do not necessarily refer to humans, cf *si paŋka* '(lit. the basis, =) host'; *si giri*<sup>27</sup> '(what is used for piercing or boring, =) awl'.

Word list:	<i>Anton M. Moeliono – Charles E. Grimes</i>
------------	--

---

### 1. Introduction

---

Malay has had the most far-reaching impact of the Austronesian languages. Its influence has been documented in a wide geographic spread going back centuries before European contact. Borrowings from Malay are attested in many vernacular languages throughout modern Malaysia, the Philippines, and Indonesia. However, Malay itself has borrowed heavily from Sanskrit, Arabic, Portuguese, Dutch, English, Chinese, and other languages. Malay has been long considered a key language for comparative Austronesian studies.

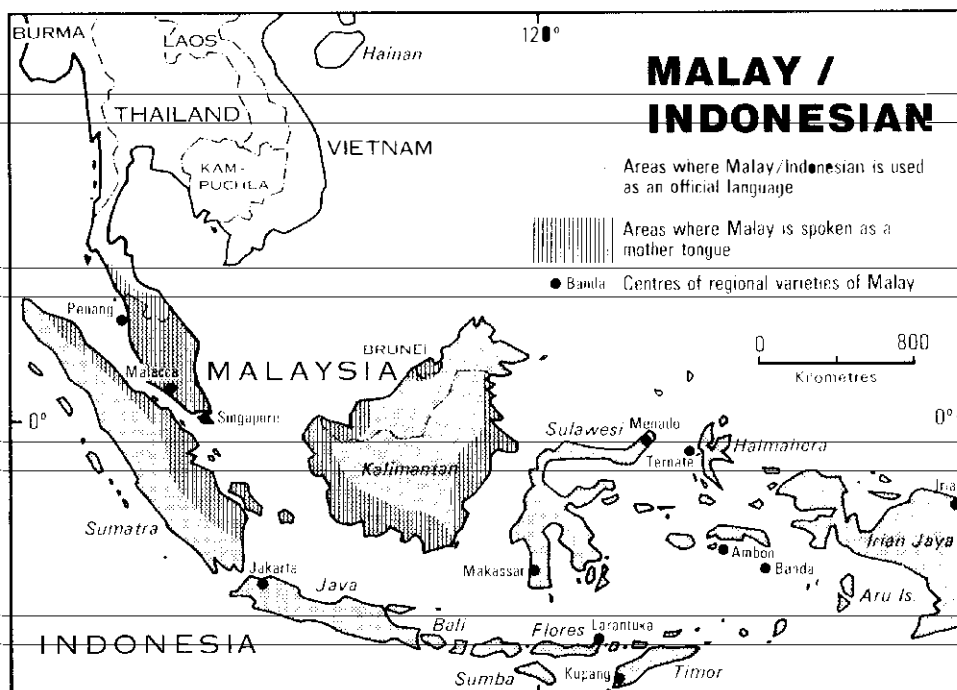

Indonesian is currently used as the “high” of an acrolect-basilect continuum in a multilingual society. Toward the lower end of the continuum are found both vernaculars (Malay and non-Malay vernaculars) and distinct regional varieties of Malay which have been in a stable diglossic relationship with the vernaculars for centuries. Prentice (1978) points out the need to distinguish between 1) *mother-tongue* Malays, 2) *lingua franca* Malays, and 3) *official-language* Malays. Mother-tongue Malays are those vernacular Malays that are spoken in their own homeland, such as those Malay languages that are native to the Malay Peninsula, eastern Sumatra, and along the western and southern coasts of Kalimantan (Borneo). *Lingua franca* Malays (here termed “regional varieties”) are those varieties that have developed from a *lingua franca* trade Malay and have become the *lingua franca* in areas to which they are not native, in the process taking on the distinct flavour of the region and frequently becoming creolised. *Official-language* Malays have their roots in the language of literature and government dating back to the Empire of Srivijaya (seventh century A.D.), but most directly associated with the language of literature and government of the Islamic Sultanates of peninsular Malaysia from the 14th-20th centuries. The “official language” Malay has its descendants in Bahasa Indonesia and Bahasa Malaysia, among others. Regional (*lingua franca* varieties of Malay), such as Macassarese Malay, Manadonese Malay,

---

---

Ambonese Malay, Jakarta Malay, and others, continue to be used in the pattern established over centuries, except that Indonesian has become an “add-on” language functioning particularly in the domains of education, government, religion, and communication.

The comparative wordlist does not document the regional or vernacular varieties of Malay found throughout insular and peninsular Southeast Asia (see Asmah Haji Omar 1977 for an overview of the latter area). We merely attempt to briefly document here the trans-regional variety of standard Indonesian as it is currently used. The difficulty is that many of the items in this word list are in speech domains that are normally associated by individual speakers with the vernacular or the regional variety of Malay, rather than with Indonesian. The authors have tried to make reasonable decisions in such cases, as their combined experience spans several regional varieties of Malay spoken throughout the archipelago.

Map 20. Mother-tongue, regional varieties, and ‘official-language’ Malays

For this volume, Indonesian Malay [Bahasa Indonesia] has been chosen as the representative of the varieties of Malay. Because Malay is among the best documented of the Austronesian languages the present list is restricted in scope. The list is intended to represent a synchronic snapshot of current

usage of standard Indonesian.<sup>1</sup> Thus the most common terms are used in the list proper, regardless of whether or not they are obvious borrowings. However, because this volume is interested primarily in comparing the native Austronesian elements of Indonesian with other Austronesian languages, the native elements and the borrowed elements are distinguished in both the introduction and the word list. Terms considered archaic and not in current usage are not added to the present list.

We estimate there are over 35 million mother tongue speakers of Indonesian, mostly in the larger urban centres with many resulting from inter-ethnic marriages.<sup>2</sup> There are probably over 125 million combined first and second-language speakers of Indonesian.

### 1.1 Additional references

Malay is among the best documented of the Austronesian languages. Rather than trying to detail the finer points of Indonesian phonology and morphology, the reader is referred to other sources for further study. Among them are: Abas (1987), Adelaar (1985), Chung (1976), Dardjowidjojo (1971), Echols – Shadily (1961, 1975), Kana (1986), Macdonald (1976), Moeliono (1986), Moeliono – Dardjowidjojo (1988), Asmah Haji Omar (1977), Poerwadarminta (1982), Prentice (1978), Wilkinson (1957). Among the more widely used Indonesian textbooks are Dardjowidjojo (1978), Johns (1990), and Wolff – Oetomo – Fietkiewicz (1985).

## 2. Phonology

Below is a brief summary of Indonesian phonology. Because the purpose of this volume is to compare Austronesian languages with each other, this present description distinguishes the phonology and phonotactics of the inherited elements of Malay from those elements that have been assimilated from other languages. Of course, very few speakers of Indonesian are aware that different patterns can be demonstrated for the inherited and borrowed

- 
1. We follow the suggestion made by the editors of *Indonesia Circle* (1980 Vol.23) that the official term “Bahasa Indonesia” is correct when writing or speaking in Indonesian, “Indonesian” is the preferred term when speaking or writing in English, and “Bahasa” by itself is to be studiously avoided. Our thanks to Sander Adelaar and Adrian Clynes for comments on earlier drafts of this introduction.
  2. These estimates are complicated by the nature of language use in a post-creole continuum. It may be more accurate to say that the estimate of native speakers of Indonesian includes native speakers of regional varieties of Malay.
-

elements of the language. For a unified synchronic description of Indonesian the reader is referred to Moeliono – Dardjowidjojo (1988).

## 2.1 Phoneme inventory

Indonesian has six vowels and twenty-three consonants (of which eighteen are inherited and five are assimilated).

### 2.1.1 Inventory of consonants

The fricatives /f š z x/ and glottal /ʔ/ are assimilated from loanwords. Alternate pronunciations (and spellings) are found for many of these sounds. Thus /f/ may be pronounced [f] or [p]; /š/ may be pronounced [z], [j] or occasionally [s]; and /x/ varies between [k], [x] and [h], and is spelled *kh*. Glottal is often indicated simply by the juxtaposition of two vowels (e.g. *maaf* ‘pardon’, *syair* ‘poem’), or by an apostrophe (e.g. *ma’af*, *syair*).

Indonesian has the following inherited consonant phonemes [phonemes assimilated from other language sources are not indicated in the figure below]:<sup>1</sup>

Table 1. Indonesian consonants

		Labial	Apical	Laminal	Dorsal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>
Fricatives				<i>s</i> <sup>2</sup>	<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ñ</i>	<i>ŋ</i>
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels		<i>w</i>		<i>y</i>	

1. The following chart is designed to highlight the phonemically significant categories of sounds in Indonesian on formal, functional and distributional grounds, rather than trying to display additional categories to show phonetic qualities. Note that the active articulators are specified rather than the traditional passive articulators. This facilitates putting /t/ and /d/ in a single category, where they belong, rather than distinguishing separate “dental” and “alveolar” categories.
2. /s/ is traditionally grouped with /t d n l r/. However, we place /s/ with the laminals on distributional grounds. An anomaly is thus not required for /s/ > /ñ/ rather than the otherwise expected /n/ in certain morphological combinations discussed below. A single broad generalisation can be made about assimilation and accretion to homorganic nasals.

### 2.1.1.1 The apicals

/d/ is predominantly alveolar, but can occasionally be dental. /t/ is predominantly dental and can at times be interdental. /n/ is prototypically alveolar, but may occasionally be fronted in the environment of /i/ or /ʉ/.

### 2.1.1.2 The dorso-glottals

Syllable final /k/ becomes [ʔ]. When a suffix is added to the root, the root final /k/ remains [k]. The phoneme is written orthographically as *k* in all environments.

(3)	/masuk/	[masuʔ]	‘enter (intrans)’	[məmasuki]	‘enter (trans)’
	/tolak/	[tolaʔ]	‘refuse’	[pənoʔlakan]	‘refusal’

The voiceless glottal fricative /h/ is often not pronounced word or utterance finally in informal speech registers. /h/ is often not pronounced between unlike vowels by many speakers, but is never dropped from between like vowels.<sup>1</sup>

(4)	/tahun/	‘year’	[tahun]	~	[taun]
	/lihat/	‘see’	[lihat]	~	[liat]

(5)	/pohon/	‘tree’			[pohon]
	/tahan/	‘restrain, endure, persevere’			[tahan]

There are regional preferences for pronouncing or not pronouncing /h/ word initially in a few lexical items.

(6)	/antar/	‘escort’	[hantar]	~	[antar]
	/hiduŋ/	‘nose’	[hiduŋ]	~	[iduŋ]

### 2.1.1.3 The /r/

The /r/ is an alveolar trill, but normally becomes a flap or tap intervocalically. In some regions /r/ is pronounced as a velar or uvular fricative and tends to be elided word-finally (see Asmah Haji Omar 1977).

1. Although /h/ is not usually pronounced between unlike vowels, there are minimal pairs of intervocalic /-h-/ with  $\emptyset$ . For example, /tuan/ ‘sir, master’ vs. /tuhan/ ‘Lord, God’ (probably derived from a single parent form). Minimal pairs with initial /h/ and  $\emptyset$  also occur, such as /arus/ ‘current’ and /harus/ ‘have to, must’.

## 2.1.2 Inventory of vowels

Indonesian has the following six vowel phonemes:

Table 2. Indonesian vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

Vowel quality and allophonic variation depend, to a large part, on the region of origin and mother tongue of the speaker. As a broad generalisation, front and back vowels /i e o u/ lower to their respective lax allophones in closed syllables. Where the vowel of the other syllable of the root has the same vowel, harmony of vowel height will also lower the like vowel of the open syllable.

(7)	<i>pintu</i>	[pintu]	'door'
	<i>salin</i>	[salɪn]	'transfer'
	<i>kiri</i>	[kiri]	'left (side)'
	<i>kirim</i>	[kɪrɪm]	'send'

### 2.1.2.1 Schwa /ə/

The vowel schwa /ə/ shifts the stress to the ultimate syllable when the /ə/ occurs in the penultimate syllable. In the penultimate and antepenultimate syllable, /ə/ is frequently elided (deleted) altogether when the syllable shape is CV, rather than CVC.

(8)	<i>səpuluh</i>	'ten'	[səpʊlʊh]	~	[spʊlʊ]
	<i>bəlakəŋ</i>	'back'	[bəlakaŋ]	~	[blakaŋ]
	<i>bəlum</i>	'not yet'	[bəlʊm]	~	[blʊm]

### 2.1.2.2 Diphthongs

What are commonly considered diphthongs (orthographically *-ai*, *-au* and *-oi*) are phonemically sequences of /ay/, /aw/, and /oy/. /ay/ sometimes varies in pronunciation between [ay], [ey] and [e] in informal speech.

(9)	<i>sampai</i>	‘arrive’	[sampay]	~	[sampey]	~	[sampe]
	<i>čapai</i>	‘tired’	[čapay]	~	[čapey]	~	[čape]

The sequence /aw/ is alternatively pronounced [aw], [ɔw] and [o].

(10)	<i>saudara</i>	‘sibling’	[sawdara]	~	[sɔwdara]	~	[sodara]
	<i>kalau</i>	‘if, when’	[kaław]	~	[kaɔw]	~	[kaɔ]

## 2.2 Word stress

Word stress (or accent) is indicated by contrast in pitch between the syllables of a word, and a slight increase in the length and force of stressed syllables. Unaffixed words in isolation are given primary stress on the penultimate syllable, except when the vowel in the penultimate syllable is schwa /ə/, in which case the stress is on the ultimate syllable.

(1)	[ˈkata]	‘word’
	[ˈbapaʔ]	‘father’
	[ˈpasir]	‘sand’
	[guˈrita]	‘octopus’
	[təˈliŋa]	‘ear’
(2)	[təˈlah]	‘already’
	[pəˈrut]	‘abdomen’
	[bəˈkas]	‘former, old’
	[kəmˈbar] <sup>1</sup>	‘twin’
	[kəmˈbaŋ]	‘blossom, develop’

When suffixes or enclitics are added two patterns are found. The first, found in the eastern part of the Malay speaking world (Java, Sulawesi, and eastward) shifts the primary stress to the right to stay on the newly formed penultimate syllable. The second pattern, found primarily in the west (Sumatra, Borneo and peninsular Malaysia) maintains the stress pattern of the root and is unaffected by affixation (see Prentice 1989).

## 3. Phonotactic constraints

The following discussion on phonotactic constraints is restricted to patterns found in the AN element of Indonesian and is adapted largely from Adelaar

1. The medial nasal element is best analysed as ambisyllabic.

(1985). Borrowed words assimilated into Indonesian provide exceptions to most of the patterns described below.

The canonical form of inherited roots is CVCVC. Some monosyllabic and trisyllabic roots also occur. Each C can be  $\emptyset$ . The medial C can be a consonant cluster, subject to the constraints described below.

### 3.1 Constraints on the distribution of vowels

#### 3.1.1 Schwa /ə/

The vowel /ə/ does not occur before the glottal fricative /h/, semivowels /w y/ or before other vowels.

Schwa /ə/ is the only vowel permitted before a cluster of /r/ + C.

- (11) *bərsih*            ‘clean’  
       *tərbaŋ*            ‘fly (vb)’

With few exceptions, schwa /ə/ is the only vowel occurring in antepenultimate syllables.<sup>1</sup>

- (12) *təliŋa*            ‘ear’  
       *səbəntar*          ‘in a moment’  
       *bənua*             ‘mainland, continent’

Root initial /ə/, or /ə/ preceded by /h/, must be followed by /l r s/ or a nasal.

- (13) *ələn*             ‘eagle, bird of prey’  
       *əmpədu*          ‘gall’ (also [həmpədu])  
       *həndak*          ‘will, want’

#### 3.1.2 Other vowels

The sequences /ay/, /aw/ and /oy/ occur only in the morpheme-final position.<sup>2</sup>

- (14) *sampai*            ‘until, arrive’  
       *baŋkai*            ‘corpse’  
       *bagai-mana*       ‘how?’ (a compound)

1. Some exceptions to this are: /gurita/ ‘octopus’, /binatan/ ‘animal’, /harimaw/ ‘tiger’.

2. An exception is /sawdara/ ‘sibling’, a Sanskrit loan.

(15)	<i>kalau</i>	‘if, when’
	<i>pulau</i>	‘island’

In some regions the distinction between /i/ and /e/, on the one hand, and /u/ and /o/, on the other hand, is neutralised in closed final syllables (see Adelaar 1985: 34-35).

(16)	<i>adik</i>	[adiʔ]	~	[adeʔ]	‘younger sibling’
	<i>kampung</i>	[kampuŋ]	~	[kamponŋ]	‘village, hamlet’

There is harmony of vowel height with front and back vowels, such that the vowel in the final syllable agrees in height with the vowel in the penultimate syllable.

(17)	<i>tipis</i>	‘thin’
	<i>leher</i>	‘neck’
	<i>pohon</i>	‘tree’
	<i>kurus</i>	‘slim’

(18)	<i>kulit</i>	‘skin’
	<i>hitung</i>	‘count’
	<i>belok</i>	‘turn’
	<i>sore</i>	‘late afternoon, evening’

The sequences /eCi/, /iCe/, /oCu/ and /uCo/ do not occur in inherited roots.

### 3.2 Constraints on the distribution of consonants

Voiced stops /b d g ʒ/, /č/ and /ñ/ do not occur root-finally in inherited roots.<sup>1</sup>

Two /r/s rarely occur within one lexeme.

#### 3.2.1 Consonant clusters

Three types of consonant clusters occur within inherited roots.

##### 3.2.1.1 Nasal + homorganic stop

(19)	<i>empat</i>	‘four’
	<i>tambah</i>	‘increase’

1. Word-final voiced stops in loan words are usually written as such, but tend to be devoiced in their pronunciation; e.g. Arabic *səbab* > [səbab] ~ [səbap] ‘because’.

(20)	<i>antar</i>	‘escort’
	<i>mundur</i>	‘reverse, back up’

(20)	<i>lanjut</i>	‘continue’
	<i>benci</i>	‘hate’
	<i>panjang</i>	‘long’
	<i>pinjam</i>	‘borrow’
	<i>injak</i>	‘step on’

(22)	<i>bayak</i>	‘corpse’
	<i>bangga</i>	‘proud’

### 3.2.1.2 /ŋ/ + /s/

The velar nasal /ŋ/ clusters with /s/ in a few lexical items.

(23)	<i>pingsan</i>	‘faint’	
	<i>langsung</i>	‘direct’	
	<i>lansat</i>	‘k.o. fruit’	(but also [lansat])

### 3.2.1.3 /r/ + certain consonants

The trill /r/ may cluster with most consonants except /h r w y/.

(24)	<i>bersih</i>	‘clean’
	<i>terbay</i>	‘fly’ (vb)

Some lexical items form clusters across morpheme boundaries and are not considered exceptions to the constraints within lexical roots (e.g. /bərhentɪ/ ‘stop’).

## 3.2.2 Constraints on semivowels /w y/

Semivowels do not occur word initially, except in a couple of cases where /y/ has been shown to derive historically from \*i (see Adelaar 1985:13).

(25)	<i>yaitu</i>	‘that is, namely’	( <i>ia + itu</i> )
	<i>yaŋ</i>	‘relative pronoun’	( <i>ia + ligature ŋ</i> )

In inherited vocabulary /y/ does not occur adjacent to the vowels /i e ə/.<sup>1</sup> /w/ does not occur adjacent to the vowels /o u ə/.

1. Exception is *bayi* ‘baby’.

#### 4. Summary of morphophonemic processes

Below is a brief discussion of some of the morphophonemic processes occurring in Indonesian.

##### 4.1 Prefixes /məŋ-/ and /pəŋ-/<sup>1</sup>

The active verbal (actor focus) prefix /məŋ-/, the actor/instrument prefix /pəŋ-/, and the nominal circumfix /pəŋ--an/ undergo predictable changes when attached to stems. Before stems beginning with voiceless obstruents /p t k/, and with voiceless /s/, there is homorganic nasal substitution.

(26)	<i>putus</i>	‘break’	>	<i>məmutus/pəmutus</i>
	<i>tabrak</i>	‘hit, collide’	>	<i>mənabrak/pənabrak</i>
	<i>karang</i>	‘compose’	>	<i>məŋarang/pəŋarang</i>
	<i>səbar</i>	‘spread s.th.’	>	<i>məŋəbarkan</i>

Before stems beginning with voiced stops /b d g j/ and voiceless /č/, there is homorganic nasal accretion.

(27)	<i>bakar</i>	‘bake, roast’	>	<i>məm-bakar/pəmbakar</i>
	<i>dapat</i>	‘get, take’	>	<i>mən-dapat</i>
	<i>gabung</i>	‘connect’	>	<i>məŋ-gabung</i>
	<i>jalan</i>	‘walk’	>	<i>məŋ-jalan-kan</i>
	<i>čari</i>	‘look for’	>	<i>məŋ-čari</i>

Before stems beginning with nasals, /l/, or /r/, the prefixes appear as /mə-/ and /pə-/.

(28)	<i>marah</i>	‘get angry at’	>	<i>mə-marah-i/pə-marah</i>
	<i>nama</i>	‘name s.th.’	>	<i>mə-nama-kan</i>
	<i>ñala</i>	‘light s.th.’	>	<i>mə-ñala-kan</i>
	<i>ŋaga</i>	‘agape’	>	<i>mə-ŋaga</i>
	<i>lapor</i>	‘report’	>	<i>mə-lapor-kan</i>
	<i>rayap</i>	‘crawl’	>	<i>mə-rayap</i>

The prefixes appear as /məŋ-/ and /pəŋ-/ before roots beginning with vowels or /h/.

1. These prefixes are often listed in the literature in a more abstract form (i.e. *məN-* and *pəN-*).

(29)	<i>angkat</i>	'lift up'	>	<i>məŋ-angkat/pəŋ-angkat</i>
	<i>ikat</i>	'tie, bind'	>	<i>məŋ-ikat/pəŋ-ikat</i>
	<i>undang</i>	'invite'	>	<i>məŋ-undang/pəŋ-undang</i>
	<i>hitung</i>	'count'	>	<i>məŋ-hitung/pəŋ-hitung</i>

Before monosyllabic (loan) roots the prefixes take the shape /məŋə-/ and /pəŋə-/.

(30)	<i>cek</i>	'check s.th.'	>	<i>məŋə-cek</i>
	<i>pel</i>	'mop'	>	<i>məŋə-pel</i>

## 4.2 The suffixes /-an/, /-kan/, and /-i/

The following morphophonemic processes apply.

### 4.2.1 Root-final /k/

Root-final /k/ is [k] when combined with the suffixes /-an/, /-kan/ and /-i/. It optionally remains glottal [ʔ] before /-kan/.

### 4.2.2 Glottal insertion

For morphological combinations resulting in sequences of /aa/ or /...V/, an epenthetic glottal [ʔ] is inserted between the vowels (but not represented orthographically).

(31)	<i>muka + -an</i>	'face'	>	[pəʔmukaʔan]
	<i>čoba + -an</i>	'try, attempt'	>	[pəʔrčobaʔan]
	<i>sə + umur</i>	'same age'	>	[səʔumur]
	<i>kə + ada + -an</i>	'situation'	>	[kəʔadaʔan]

### 4.2.3 Root-final /h/

Root-final /h/ preceded by a high or mid vowel is often not pronounced or may result in a glide for some speakers when /-an/ is suffixed. Before /-i/ root final /h/ is often not pronounced

(32)	<i>latih</i>	'train, exercise'	>	[latihan]	~	[latiyan/latian]
	<i>puluh</i>	'ten'	>	[puluhan]	~	[puluwan/puluan]
	<i>marah</i>	'angry'	>	[məmarahi]	~	[məmarai]

## 5. A summary of the morphology

Primary functions of common prefixes, suffixes and circumfixes in Indonesian are summarised briefly below. For a more complete discussion see the literature cited above.

(33) <i>bər-</i>	stative, habitual, intra-directive
<i>məŋ-</i>	agent focus / active / promotion of actor
<i>di-</i>	patient focus / passive / promotion of undergoer
<i>məmpər-</i>	causative (with counterpart <i>dipər-</i> )
<i>tər</i>	agentless passive, unintentional, superlative
<i>pəŋ-</i>	agentive, instrumental
(34) <i>-kan</i>	valence increaser, causative, benefactive
<i>-i</i>	locative/goal marker, marks the thing whose location is in question, repetitive, exhaustive
<i>-an</i>	nominaliser (usually concrete), collective
(35) <i>kə-(stem)-an</i>	adversative passive
<i>kə-(stem)-an</i>	abstract nominaliser
<i>pəŋ-(stem)-an</i>	nominaliser (process/activity/resulting state)
<i>pər-(stem)-an</i>	nominaliser (process/resulting state)

## 6. Notes on standard orthography

The standard Indonesian orthography (post-1972) uses the digraph *ng* for /ŋ/, *ny* for /ñ/, *kh* for /x/, *sy* for /š/, *c* for /č/, *j* for /j/. The vowels /e/ and /ə/ are undifferentiated and symbolised by a single letter *e*. The sequences /ay/ /aw/ /oy/ are written *ai*, *au* and *oi* respectively.

## 21. Sundanese

---

---

<b>Contributors:</b>
----------------------

Introduction: <i>Adrian Clynes</i>
------------------------------------

Wordlist: <i>Emuh Herman Sumantri</i>
---------------------------------------

---

### 1. Introduction

---

Sundanese is, after Javanese, the major native language of the island of Java. It is spoken throughout the western third of the island, with the exception of a thin strip along the northern coast, where Javanese and Jakarta Malay predominate. In 1980, the last census for which language spoken was surveyed, more than 22 million people, or 15% of the Indonesian population, indicated they spoke Sundanese in the home. At current rates of population increase there are now at least 27 million speakers of Sundanese. Of these, more than 750,000 have settled on other islands in Indonesia, particularly in southern Sumatra, through migration and transmigration.

The extensive dialect survey by Nothofer (1980) recognises four principal dialect areas: Banten, Priangan, Bogor/Krawang, and Cirebon. Other dialect studies include those by Indonesian scholars published by the Pusat Pembinaan dan Pengembangan Bahasa (see bibliography in Hardjadibrata 1985)

Like Javanese, Sundanese is characterised by “speech styles” or distinct formal and everyday registers. It is generally accepted that both the bulk of the “high” lexis and the styles phenomenon itself are borrowings from Javanese. In the wordlist only items from the everyday vocabulary are given.

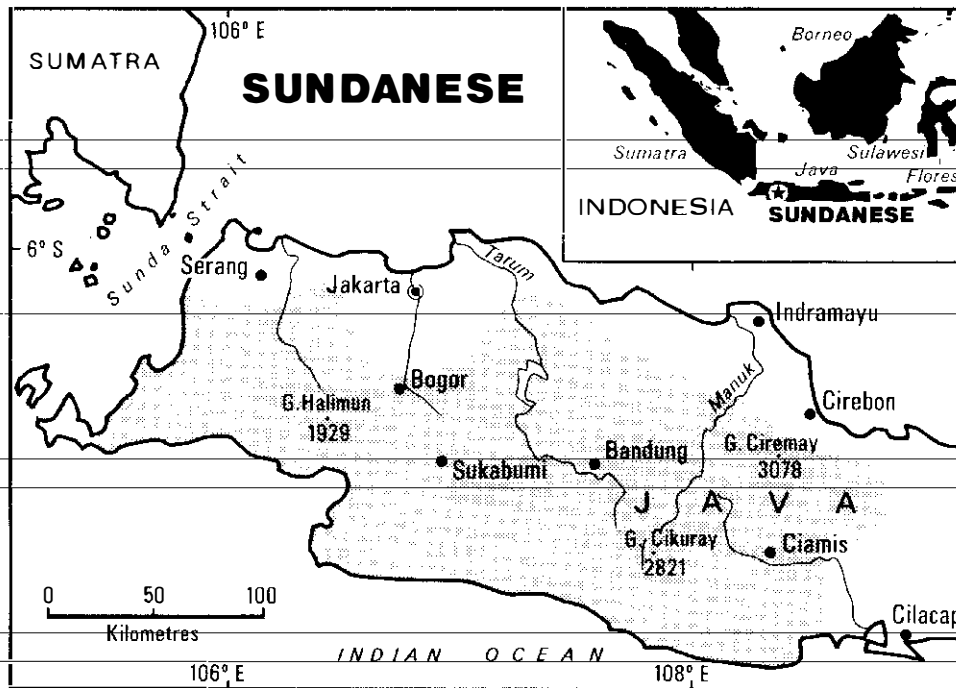

Sundanese has been influenced by both Malay and Javanese for many centuries. There are also significant Sanskrit and Arabic elements in the lexicon due to successive waves of Hindu and Islamic influence.

There is debate about the historical relationship of Sundanese to neighbouring languages. Esser sub-grouped Sundanese with Madurese and Javanese (1938), then later speculated (see Noorduyn 1963) that it would be better grouped with Malay, Malay-related Sumatran languages, and “some of the Dayak languages”. In neither case was the basis for these classifications indicated. Dyen (1965) sub-grouped Sundanese with Javanese, Madurese and Malay, on lexicostatistical grounds. This was in turn the basis for

---

---

Nothofer's reconstruction of a "Proto-Malayo-Javanic" (1975). Blust (1981) suggests a sub-grouping similar to Esser's second proposal, but including Acehnese and Chamic languages, and excluding Javanese and Madurese. Nothofer (1985) argues that Sundanese sub-groups with Lampung, Malay, Iban, Madurese and Javanese, but that the first five languages are more closely related to each other than they are to Javanese.

Map 21. Sundanese language area

Given its importance as a regional language in Indonesia, and one with a long written history (Uhlenbeck 1971, de Casparis 1975), Sundanese remains relatively little studied. Uhlenbeck (1964) and (1971) are critical bibliographical surveys, including the grammars written in Dutch in the nineteenth and early twentieth centuries. Robins published several important articles in the 1950s and 1960s (anthologised in Robins 1970 and 1983). A recent short grammar in English is Hardjadibrata (1985), containing a useful bibliographical survey. Dictionaries include the important Eringa (1984, Sundanese-Dutch), and the good monolingual Lembaga Basa jeung Sastra Sunda (1976). Rigg (1862) is the only Sundanese-English dictionary.

## 2. Sketch of phonology and morphology<sup>1</sup>

### 2.1 Phonology

#### 2.1.1 Consonants

The consonant phonemes are:

	Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	<i>ʔ</i>
	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>	
Fricatives			<i>s</i>		<i>h</i>
Nasals	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals		<i>l</i>			
Vibrants		<i>r</i>			
Glides	<i>w</i>		<i>y</i>		

Final /k/ is realised as [k], not as [ʔ], contrary to a pattern common in the region. On the other hand [ʔ] occurs in a variety of positions, e.g. utterance-finally after a vowel, morpheme-internally between like vowels, and before all “vowel-initial”-stems (prefixed or not) and words. Van Syoc (1959) gives phoneme status to [ʔ] everywhere. Robins (1953a) does not, arguing that its occurrence is always predictable. In a later article he takes a more non-committal approach (1959: 342). In the wordlist we follow the general approach of Robins (1953). Note though that an analysis which does not take into account morphological information requires /ʔ/ morpheme-initially before vowels and between like vowels (see also Robins 1959: 341-342). Examples of phonetic realisation include:

<i>indit</i> [ʔindit]	‘leave’	<i>paŋ-indit</i> [paŋʔindit]	‘reason for leaving’
<i>kota</i> [kota(ʔ)]	‘town’	<i>tiis</i> [tiʔis]	‘cold’

The transcription of *kota* as [kota(ʔ)] indicates that when utterance-final (for example, the citation form) it occurs with non-phonemic [ʔ].

1. Thanks to Bob Bugenhagen and Charles Grimes for comments on an early version of this introduction.

### 2.1.2 Vowels

There are seven vowel phonemes:

	Front	Central	Back
High	<i>i</i>	<i>ɨ</i>	<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

*/i/* is transcribed by Robins as */ɨ/*. Nothofer (1975, 1980) argues that */i/* is the regular reflex of an earlier *\*/ə/*, while modern-day */ə/* derives mainly from Javanese, and some Malay, loanwords.

Robins (1957) is an important study of non-phonemic nasality as a prosody in Sundanese, the first detailed account of what is an areal feature of western Indonesian languages (see Court 1970, Durie 1985).

### 2.1.3. Stress

Stress is normally on the penultimate syllable of the phonological word, which may consist of more than one grammatical word (Robins 1953a):

<i>isuk</i> ['isuk] 'morning'	<i>isukan</i> [i'sukan] 'tomorrow'
<i>diuk</i> ['diuk] 'sit'	<i>mili</i> ['mili] 'buy'
<i>ka ban</i> ['kaban] 'to the bank'	<i>di-čet</i> ['dičet] 'painted'
<i>paman</i> ['paman] 'uncle'	<i>paman-na</i> [pa'mana] 'his uncle'

Stress shifts to the final syllable if the penultimate vowel is */ə/* (but not if it is */i/*, see *mili* above):

<i>gəde</i> 'big' [gə'de]	<i>ᵇabədil</i> [ᵇabə'dil] 'shoot'
---------------------------	-----------------------------------

See Robins (1953a) for further discussion of stress distribution.

## 2.2 Morphology

Sundanese is an agglutinating language, with a variety of derivational and inflectional morphology. Studies of the morphology include Robins (1959), Van Syoc (1959), and Prawirasumantri et al (1979). Here we list only those items found in the wordlist.

### 2.2.1 Verb affixes

- N-* marks “actor-pivot” (see Foley – Van Valin 1984) or “active” transitive verbs, and a sub-class of “dynamic” intransitive verbs. For realisations see Section 5 below.
- ba-* marks intransitive verbs, often expressing states or durative actions.
- ti-* indicates lack of volition, on punctual intransitive verbs.
- kin* marks transitive verbs, typically further specifying the semantic role of the undergoer NP (see Foley – Van Valin 1984) as “circumstantial”: benefactee, causee, thing transferred).
- an* on transitive verbs, typically further specifies the semantic role of the undergoer NP as “locative”: location, goal or recipient.
- in* expresses a “personal state or condition” (Robins 1959).
- ar-* (with allomorph *-al-*, see 2.3) this “plural” infix also occurs on nominals. Infixes to a verb, it marks plurality of the subject of the verb, or of the action itself.
- um-* forms intransitive verbs from verbal and nominal bases.
- RED* the initial syllable or the stem may be reduplicated to form an intransitive or transitive verb.
- ka-* *-an* co-occur, generally deriving intransitives from other (stative) intransitives.

### 2.2.2 Nominal affixes

- pa-* occurs both on bare roots and stems of form (N+root), forming nouns with various meanings: abstract, agentive and passive (see Robins 1959: 350-351)
- paŋ-* occurs both on bare roots and sometimes very complex stems, forming nominals with various meanings: abstract, agentive and passive (see Robins 1959: 351). Note that the *ŋ* segment does not assimilate to the initial consonant of the stem.
- an* nominaliser, meanings include ‘thing which undergoes (verb)’; ‘thing like (stem)’; ‘collection of (noun)’; ‘place where (stem) is found/done’.
- in* forms nouns with locative/temporal sense, often used adverbially; from transitive verbs; forms nouns with meaning ‘thing which undergoes (verb)’: *pake-in* ‘thing worn, used’.

*pa-* *-an* form nouns from both verbal and nominal stems, with a variety of meanings.

**RED** the initial syllable or the stem may be reduplicated to form a noun. In some cases of initial syllable reduplication, *ŋ* may occur before the stem: *birat* ‘heavy’, *bɪŋbirat* ‘ballast’.

*-ar-* (with allomorph *-al-*, see 2.3) this infix marks plurality, compare *maneh* ‘3sg pronoun’, *maraneh* ‘3 pl pronoun’.

*ka-* *-an* forms nouns from verbal and nominal stems.

### 2.3 Morphophonemic alternations

1. *N-* The verbal prefix *N-* has realisations varying with the initial segment of the stem to which it is affixed, and the number of syllables of that stem:

– as *ŋ-* before vowels:

*ŋ-ala* ‘gather’

*ŋ-inum* ‘drink’

– as *ŋa-* (~ *ŋə-*) before monosyllabic roots:

*ŋa-čet*, *ŋə-čet* ‘paint’

*ŋa-bor*, *ŋə-bor* ‘drill’

– as *ŋa-* before stems beginning with voiced consonants and *h*:

*ŋa-dahar* ‘eat’

*ŋa-rawat* ‘look after’

*ŋa-ñaho-an* ‘inform’

*ŋa-widaŋ* ‘dry skins’

*ŋa-hees-kin* ‘put to sleep’

and, exceptionally, before some vowel-initial stems:

*ŋa-asup-an*

~ *ŋasupan* ‘enter’

*ŋa-oyag-kin*

~ *ŋoyagkin* ‘shake’

– as the homorganic nasal, with nasal substitution, before stems of more than one syllable beginning with voiceless obstruents:

*make* (*pake*) ‘use’

*naek* (*taek*) ‘go up’

*ñapuan* (*sapu-an*) ‘sweep’

*nokot* (*čokot*) ‘take’

*ŋipasan* (*kipas-an*) ‘fan (vb trans)’

and, for some high-frequency forms, before stems of more than one syllable beginning with *voiced* oral consonants:

*mere* (*bere*) ‘give’

*ñiin* (*jiin*) ‘make’

*negel* (*gegel*) ‘bite’

*madaŋ* (*wadaŋ*) ‘eat (dial.)’

## 2. -ar- /-al-

-al- is used with forms whose initial consonant is *l*, and with those containing a following *r*, except as initial consonant of the second syllable' (Robins 1959: 343, after Eringa 1949: 94-95):

*limpaŋ* 'run' *l-al-impaŋ*      *biŋhar* 'be rich' *b-al-iŋar*  
*hormat* 'honour' *h-al-or-mat*      *gumbara* 'wander' *ŋ-al-umbara*

Elsewhere -ar- is used:

*dibawa* 'be carried' *dib-ar-awa*      *sare* 'sleep' *s-ar-are*

## 3. Orthography

There are three writing systems, the *Aksara*, Arabic and Roman scripts. The *aksara* in its most recent form derives from Javanese, though there are some differences in conventions. The *Aksara* and Arabic scripts are largely phonemic, though in both /ə/ and /i/ are represented with a single symbol. Coolsma (1904/1985) has some information on the two scripts.

Roman script is most commonly used now. This was last revised in the 1970s, following the revision of the Indonesian alphabet. The Roman script is phonemic (assuming the non-phonemic status of glottal stop, which is not represented), except that:

- grapheme *e* represents both /ə/ and /e/, *eu* represents /i/;
- *n* also represents /ñ/ before /č/ and /j/;
- the digraph *ng* represents /ŋ/, *ny* represents /ñ/ before vowels.

## 4. About the word list

Transitive verbs are cited in the “actor pivot” or “active” form (that is, prefixed by the appropriate realisation of the morpheme *N-*) (see above), since this form best translates the headword. The stem is given in brackets, where it is not immediately recoverable from the morpheme breaks indicated. Some intransitive verbs are also prefixed with *N-*.

Morpheme breaks are generally indicated, except where their synchronic status is questionable, e.g. *buruan* ‘yard, court’ cannot be related to the existing verbal root *buru* ‘chase (etc)’, hence is not represented as *\*buru-an*.

The transcription is phonemic, as with the comparative lexicon throughout.

Wordlist:	<i>C. Rudyanto</i>
-----------	--------------------

---

### 1. Introduction

---

Javanese is, with Sundanese, the principal native language of the island of Java, Indonesia. It is spoken in the central and eastern parts of the island, as well as in northern coastal areas of west Java, around Banten and Cirebon.

According to the 1980 census, the last for which language spoken was surveyed, approximately 41 percent of Indonesian families speak Javanese at home on a daily basis. As such Javanese ranks after Indonesian as the second-most-spoken Austronesian language, with around 75 million speakers (based on an estimated current Indonesian population of 180 million). Of this total, a significant number have settled on other islands in Indonesia, through migration and transmigration, with around 7.5 million on the island of Sumatra, particularly in the provinces of Lampung (in south Sumatra) and Sumatera Utara (in north Sumatra), around 400,000 in Kalimantan and 200,000 in Sulawesi. Javanese is also spoken by around 60,000 descendants of indentured workers in the former Dutch colony of Suriname. Around 5,000 people of Javanese descent live in New Caledonia, though we have no information as to language use.

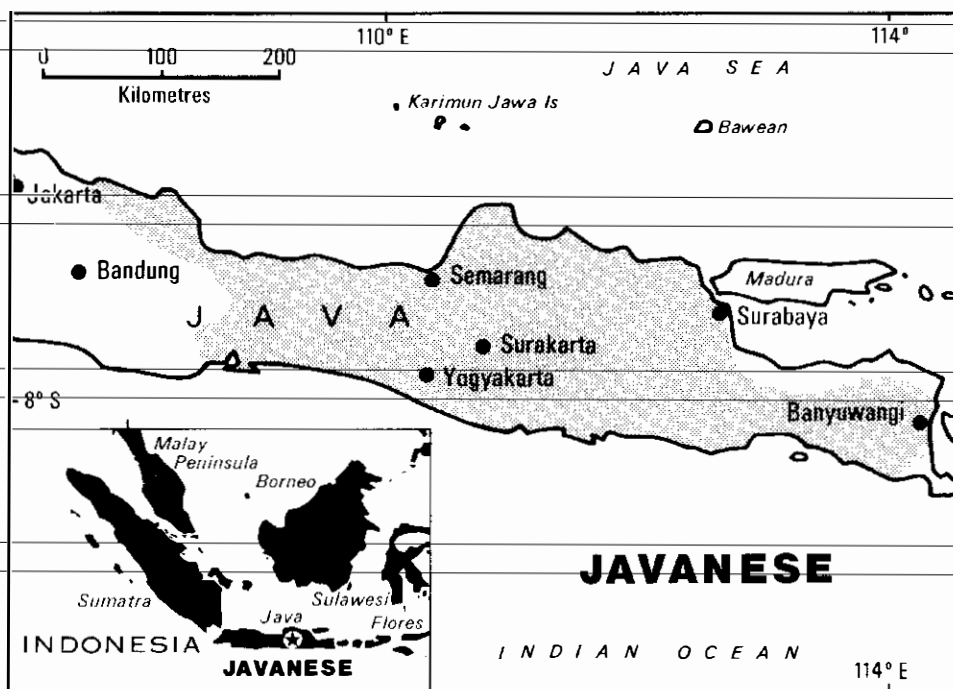

There is considerable dialectal variation. Dialect studies include Nothofer (1980, 1981), Smith-Hefner (1983), Kartomihardjo (1981), Wolfowitz (1984, on Suriname Javanese), Oetomo (1987), and a series of publications in Indonesian by the Pusat Pembinaan dan Pengembangan Bahasa (including Sabariyanto et al.1985, Iskandarwassid 1985, Soedjito et al. 1984, Soemarto et al.1986, Soetoko et al.1984). Generally three main dialect regions are recognised: western, central and eastern. Nothofer (1980) describes seven main sub-dialects in the western part of Java (Banten, Krawang, Indramayu, Cirebon, Brebes/Tegal, Banyumas, Ciamis). There is no similarly detailed sub-classification of central or eastern dialects, though Ras (1985) gives a brief summary of some phonological and morphological variation in central Javanese (which he sub-divides into four areas) and eastern Javanese (two areas, clearly an over-simplification). The Osing dialect spoken around

---

---

Banyuwangi (see Sugono 1983) deviates significantly from others. The language of the central Javanese towns (and former court centres) of Yogyakarta and Surakarta is the prestige variety and basis for the standard language used in schools, literature and the media.

Javanese is characterised by “speech styles” or “levels”: distinct formal, semi-formal and everyday registers, in which social distance and differences in the relative status of the speaker and the person spoken to (or referred to) are expressed by lexical choices. To express a wide variety of meanings occurring frequently in everyday speech, speakers must choose between two or more words or affixes. Errington (1985 and 1988) describes sociolinguistic aspects of Central Javanese style usage. Clynes (1989) proposes rules of lexical cooccurrence for the same variety, and (1992) argues that the styles phenomenon must have been already well developed in the fifteenth century, two centuries earlier than is generally assumed. In the wordlist only items from the *ngoko* (‘low’) lexis are listed, since this portion of the lexicon corresponds best to “native Javanese”.

Map 22. Javanese language area

With Malay, Javanese has been a dominant language in the Indonesian archipelago for many centuries. The two languages have extensively influenced each other, and neighbouring languages, during that time. Recently the pace of Indonesian influence on Javanese has increased, just as

Javanese now exerts a major influence on Indonesian (S. Poedjosoedarmo 1982). There was considerable Sanskrit influence on the lexicon during the Hindu-Javanese period (till the early sixteenth century), see Gonda (1952), and Arabic has since had a similar influence.

The extensive areal influence Javanese and Malay have had over the centuries has created difficulties for those studying the historical relationships between languages in the region. Javanese was sub-grouped with Madurese and Sundanese by Esser (1938), though the basis for this classification was not indicated. Dyen (1965) sub-grouped Javanese with Madurese, Sundanese and Malay, on lexicostatistical grounds. This was in turn the basis for Nothofer's reconstruction of a putative "Proto-Malayo-Javanic". Blust (1981) argues against Dyen's sub-grouping, and refers to a "Java-Bali-Sasak" group (1985), though again the basis for the grouping is not given. Nothofer (1985) proposes that Javanese sub-groups with Lampung, Malay, Iban, Sundanese and Madurese, but that the latter five languages are more closely related to each other than they are to Javanese.

Apart from issues of sub-grouping, historically Javanese is important in that it is one of the few Austronesian languages for which a large number of texts dating from before the nineteenth century (in fact from the eighth century onwards) have been preserved. The language in that time has evolved from one typologically similar to modern-day Philippines languages, to one which shares some features with languages in the Oceanic area. This evolution has been little studied, even though it may offer models to help explain linguistic change elsewhere in the Austronesian family.

Next to Malay, Javanese is the most studied of the Indonesian languages. Uhlenbeck (1964) and (1971) are critical bibliographical surveys of work up to that time, including the only extensive grammars written in Dutch in the nineteenth and early twentieth centuries. Our bibliography is not intended to be exhaustive: references to other recent publications may be found in the individual bibliographies of works listed there. Uhlenbeck (1978) is a collection of articles on the morphology of Javanese. Other works include S. Poedjosoedarmo et al. (1978a), G. Poedjosoedarmo (1986), and Suharno (1982). Manuals include Keeler (1984), Ras (1985) and Horne (1961). Dictionaries include Gericke – Roorda (1901), Pigeaud (1938), Horne (1974) and Prawiroatmodjo (1981). Studies of Old Javanese are fewer, but include Zoetmulder's important dictionary (1982) and his survey of Old Javanese literature (1974). Apart from Teselkin's brief outline (1972, a translation of 1963), the only short grammars are in Dutch (Zoetmulder 1950) and in Indonesian: Zoetmulder – Poedjawijatna (1961), and Mardiarsito – Kridalaksana (1984), principally a sketch of the morphology.

---

---

## 2. Sketch of phonology and morphology<sup>1</sup>

### 2.1 Phonology

The Javanese phoneme repertoire is similar to those of other Western Indonesian languages. The vowel system of the central Javanese “standard” varieties has been variously described as having from six to eight vowels (see below). Javanese shares with Madurese a phonemic distinction between apico-dental and apico-alveolar (“retroflex”) stop consonants, not generally found in the area. Phonetically the “voiced” stop series is voiceless, with breathy voice phonation of the following vowel (Fagan 1988, and references there). Both these features may be due to Indic influence (see Dahl 1981), though some say the two apical consonant series derive from PAN (e.g. Wolff 1988).

Short discussions of the phonology (of mainly central Javanese) are given in Horne (1974), Ras (1985) and Yallop (1982). Yallop also contains further references.

#### 2.1.1 Consonants

The consonant phonemes used in the wordlist are:

	Labial	Apico-dental	Apico-alveolar	Laminal	Dorsal	Glottal
Stops/Affricates	<i>p</i> <i>b</i>	<i>t</i> <i>d</i>	<i>ʈ</i> <i>ɖ</i>	<i>ç</i> <i>ʝ</i>	<i>k</i> <i>g</i>	<i>ʔ</i>
Fricatives				<i>s</i>		<i>h</i>
Nasals	<i>m</i>		<i>n</i>	<i>ɳ</i>	<i>ŋ</i>	
Laterals			<i>l</i>			
Vibrants			<i>r</i>			
Glides	<i>w</i>			<i>y</i>		

*/h/*, */wh/* and */yh/*, with the same phonetic characteristics as the “voiced” stop series (see above), have marginal status, being used in certain interjections and loanwords (G. Poedjosoedarmo 1986).

1. Thanks to Bob Bugenhagen and Avery Andrews for comments on an early version of this introduction.

The laminal series are traditionally described as “palatals”, however they are phonetically alveolar, as in neighbouring languages.<sup>1</sup>

The status of [ʔ] has been subject of debate. Uhlenbeck (1949) analyses it as an allophone of /k/, but gives the two phones separate phoneme status in Uhlenbeck (1950). In the dialect of the wordlist, /ʔ/ clearly contrasts with /k/, though it is restricted to syllable-final position (see “morpheme final stops”, below).

There is also evidence for a separate pre-nasalised obstruent series. Word-initial NC sequences usually occur only ‘across’ a morpheme boundary, though see Horne (1974: xvii), on verb roots of form (ə)NCV(C). Medially there is also evidence for a pre-nasalised series: generally vowels preceding such sequences pattern phonetically as though they were in open, not closed, syllables – the NC sequence thus behaves as a single segment:

<i>pintar</i> ‘clever’	: [pintər] not *[pintər]
<i>lunguh</i> ‘sit’	: [lunguh not *[lunguh]
<i>ban̩sa</i> ‘kind’	: [bɔŋsɔ] not *[ban̩sɔ]

The traditional ‘bi-phonemic’ analysis is assumed below.

### 2.1.2 Vowels

C. Rudyanto, the compiler of the word list, uses the following 8-vowel system:

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid-high	<i>e</i>		<i>o</i>
Mid-low	<i>ɛ</i>	<i>ə</i>	<i>ɔ</i>
Low		<i>a</i>	

Other vowel phoneme systems have been proposed, mainly because the vowels [e] and [ɛ] are largely if not entirely in complementary distribution, as are [o] and [ɔ]. Yallop (1982) surveys the various proposals: two different eight-vowel systems (Sumukti 1971, Uhlenbeck 1975), a seven-vowel

1. This has significance for the reconstruction of the PAN consonant repertoire: Dempwolff reconstructed a “palatal” series largely on the basis of descriptions of Javanese nasal substitution.

(Horne 1974), a classical phonemic six-vowel (Uhlenbeck 1949) and a generative six-vowel system (Dudas 1976). These analyses are hampered by an inadequate description of factors such as stress and syllable structure. Taking the latter into account, a six-vowel analysis (/i, e, u, o, ə, a/) of the wordlist variety is possible, even using an otherwise almost classical phonemic approach. Nothofer (1980) also proposes a six-vowel system for nearly all the dialects covered in that work. The following allophonic rules account for vowel allophony in the wordlist:

$V_{HI}$	→	lax	/ closed syllables
	→	tense	elsewhere
$V_{MID}$	→	mid-low	/1. closed syllables
NON-CENTRAL			
			2. in open syllables where the vowel in a following open syllable is high.
			3. in open syllables where the vowel in a following closed syllable is identical, or /ə/.
	→	mid-high	elsewhere
/ə/	→	[ə]	
/a/	→	[ɔ]	/1. word-finally
			2. In penultimate open syllables where the vowel in the following open syllable is /a/
	→	[a]	elsewhere <sup>1</sup>

This analysis depends on a recognition that different suffixes behave differently in terms of syllabification, as do high vowels as opposed to vowels of other heights:

1. Regardless of whether they are open or closed, when suffixes of form -C(...) are attached, the stem-final vowel behaves as though it is in a closed syllable:

<i>ombe</i> [ombe]	‘drink’
<i>ombe-nana</i> [ombenənɔ]	‘drink-locative imperative’
<i>pindo</i> [pindo]	‘twice’
<i>pindo-n</i> [pindən]	‘redone’;

1. In the variety that Ras (1985) describes (“standard central Javanese”), /a/ > [a] in closed syllables. This is not indicated in the wordlist data, even though the two varieties are very similar.

where that stem-final vowel is high, it is lowered to mid:

<i>isi</i> ‘fill’	<i>ise-nane</i> [isenane] (- <i>nane</i> ‘optative locative’ suffix)
<i>gugu</i> ‘believe’	<i>gugo-n</i> [gugɔn] ‘belief’
<i>lɔbu</i> ‘enter’	<i>di-lɔbo-ʔke</i> [dilɔbɔʔke] ‘be put into’.

Evidence from reduplication supports the hypothesis that the suffix-initial consonant syllabifies with the stem-final vowel, to form a new “phonological stem”:

<i>ɔnti</i> ‘wait’	<i>di-ɔnten-ɔnteni</i> [diɔntenɔnteni] ‘be waited for (durative)’ not * <i>di-ɔnti-ɔnteni</i>
<i>uni</i> ‘sound’	<i>di-uneʔ-uneʔ-ke</i> [diuneʔuneʔke] ‘be complained about’ not * <i>di-uni-uneʔke</i>

This analysis also removes the anomalous “initial” glottal stop of *-ʔke*, elsewhere occurring only syllable-finally.

“Clitics” can be differentiated from suffixes since they do not trigger the above vowel alternations, e.g. *-ku* ‘1st person’, *-mu* ‘2nd person’, *-ne* ‘3rd person’:

<i>isi</i> ‘contents’	<i>isi-ne</i> [isine] ‘its contents’
<i>aɟi</i> ‘younger sibling’	<i>aɟi-mu</i> [aɟimu] ‘your younger sibling’

However the allomorph of *-ne*, *-e*, behaves as a suffix, since it opens a preceding closed syllable (*salin* [salɪn], *salin-e* [saline]) see below. The homophonous affixes *-nən* ‘passive imperative’ and ‘bodily state verbaliser’ are also exceptional in patterning like clitics:

<i>ombe</i> [ombe] ‘drink’	<i>ombe-nən</i> [ombenən] ‘(let it) be drunk!’
----------------------------	--

2. When any vowel-initial suffix (i.e. of form *-V(...)*) is attached, the stem-final vowel behaves as though it is in an open syllable, if it is high:

<i>waŋsul</i> [waŋsɯl] ‘reply’	<i>eliŋ</i> [elɪŋ] ‘remember’
<i>waŋsulan</i> [waŋsɯlan] ‘reply (n)’	<i>keliŋan</i> [keliŋan] ‘remember’
<i>salin</i> [salɪn] ‘change’	<i>tutup</i> [tutɯp] ‘close’
<i>salin-ana</i> [salinɔnɔ] ‘change them!’	<i>tutup-ana</i> [tutɯpɔnɔ] ‘close them!’

otherwise there is no change:

<i>weneh</i> [weneh] ‘give’	<i>ŋ-isor</i> [ŋisɔr] ‘below’
<i>di-weneh-i</i> [diwenehi] ‘given to’	<i>ŋ-isor-e</i> [ŋisɔre] ‘below’.

For further discussion and examples, and different analyses, see Yallop (1982) and Horne (1974).

### 2.1.3. Phonotactic constraints

#### Consonant and vowel harmony

We refer the reader to Uhlenbeck (1949, 1950) for a discussion of morpheme phonotactics. Uhlenbeck reports constraints of consonant harmony similar to those identified in Malay and PMP by Adelaar (1983). In morphemes of shape  $C_1V(N)C_2VC$ , where  $C_1$  and  $C_2$  are obstruents, or  $w$ , and share the same place of articulation, they must also share the same manner of articulation (that is,  $C_1$  and  $C_2$  must be identical). There are very few exceptions to this rule.

There is also a strong tendency for height harmony between the first and the second vowel in morphemes of this shape: cooccurrence of high and mid-high vowels, in either order, or mid-high followed by schwa, is unusual.

#### Morpheme-final stops

In eastern and central dialects, including that of the wordlist, only voiceless stops may occur word-finally, for most speakers. Until recently in the central dialects, voiced stem-final stop phonemes alternated with their voiceless counterparts according to whether or not they bore suffixes: e.g. *gubuk* ‘hut’ and (formerly) *gubug-e* ‘the hut’, now most commonly *gubuk-e*. That is, the non-suffixed form has been re-analysed as being also the “underlying” form. The dictionaries cite such roots as having voiced final stops, partly because the orthography still makes the distinction (see e.g. Home (1974: xv-xvi), for a brief discussion).

This process of re-analysis has similarly given phoneme status to [ʔ], formerly the word-final allophone of /k/, since it now contrasts with morpheme-final /k/. In the wordlist dialect, /ʔ/ no longer alternates with /k/ word finally: *manuʔ* ‘bird’, *manuʔ-e* ‘the bird’.

#### Intervocalic *w* and *y*

In the orthography there is variation between forms such as *guɔ* and *guwɔ*, *keoŋ* and *keyoŋ*. Glides are thus optional in the orthography intervocalically after (mid-)high vowels. In the wordlist these glides are not indicated. It can be argued that they do not form part of the phonemic structure of the word. For example, native speakers syllabify thus: *gu-ɔ*, not *\*gu-wɔ*, *du-ur* not *\*du-wur*, *ko-e* not *\*ko-we*.

However certain occurrences of intervocalic *w*, usually deriving from an earlier *\*b*, e.g. *uwi* ‘yam’, *tuwuh* ‘grow’, *duwe* ‘own’, are retained in syllabification, and native speakers insist on the reality of such segments. These are therefore indicated.

## 2.2 Morphology

Javanese is an agglutinating language, with a variety of derivational and inflectional morphology. Studies of the morphology include Uhlenbeck (1978), and Poedjosoedarmo et al (1981). Horne (1974) has a useful short survey. Here we list only those items found in the wordlist.

### 2.2.1 Verb affixes

- N-* marks “active” or “actor-pivot” transitive verbs, and a sub-class of “dynamic” intransitive verbs. For realisations see 2.3, morpho-phonemic alternations.
- mə-* (*m-* before vowels, *l* or *r*) marks intransitive verbs, often expressing states or durative actions.
- kə-* indicates lack of volition, on some intransitive verbs.
- ke* (*-ʔke* after a vowel) marks transitive verbs, typically further specifying the semantic role of the undergoer NP (see Foley – Van Valin 1984) as “circumstantial”: benefactee, causee, thing transferred). In written and formal styles the forms are *-ake* and *-ʔake*.
- i* (*~ -ni* after a vowel, *~ -an* on imperatives) marks transitive verbs, typically further specifying the semantic role of the undergoer NP as “locative”: location, goal or recipient.
- ən* marks non-volitional stative intransitives, typically referring to bodily states.
- an* (*~ -n* after a vowel) derives intransitives with a stative, durative or habitual sense.

Some lexical items also contain the fossilized infix *um ~ əm*. This does not have separate morpheme status in modern Javanese.

### 2.2.2 Nominal affixes

*pə-* (*p-* before vowels, *l* or *r*) nominaliser, forming nouns with various meanings, including ‘person or instrument doing (*N-* [transitive] verb stem)’, ‘object or person undergoing ([transitive] verb stem)’. *pa-* replaces *pə-* in formal styles.

*-an* (*-n* after vowels) nominaliser, meanings include ‘thing which undergoes (verb)’, ‘thing like (stem)’, ‘collection of (noun)’, ‘place where (stem) is found/ done’.

*pə- -an*: this combination forms nouns with meanings including ‘place where (stem) is done/found’, ‘process or result of (stem)’. Varies with *pa- -an* (formal).

**RED** some nouns are formed by reduplication of the first syllable of a base (with reduction of the reduplicated vowel to schwa). The base may be a noun or an “adjective”.

*N<sub>loc</sub>-* a locative preposition, cliticises to a nominal base to form a prepositional phrase which is a single phonological word: *omah* ‘house’ *ŋ-omah* ‘at, to, in (etc) home’. Some forms function in turn as complex prepositions. For realisations see 2.3.

*kə- -an* nominaliser, forms abstract nouns ‘condition, quality of [stem]’, ‘place of [stem]’. Varies with *ka- -an* (formal).

### 2.3 Morphophonemic alternations

1. *N-* The verbal prefix *N-* and the locative *N<sub>loc</sub>-* have realisations varying with the initial segment of the stem to which they are affixed, and the number of syllables of that stem:

– as *ŋə-* (~ *ŋa-* lexically) before monosyllabic bases:

*ŋə-čət* ‘paint’                      *ŋə-bor* ‘drill’.

– as *ŋ-* before vowels, and bases of more than one syllable beginning with a liquid:

*ŋ-ombe* ‘drink’                      *ŋ-arəp* ‘before’  
*ŋ-larap-i* ‘cover’                      *ŋ-rəksə* ‘look after’

– as the homorganic nasal, with nasal accretion, before bases of more than one syllable beginning with a voiced stop:

*m-baŋun* ‘build’                      *n-ɗayun* ‘row’  
*ñ-ǰəro* ‘inside’                      *ŋ-gantuŋ* ‘hang’

- as the homorganic nasal, with nasal substitution, before bases of more than one syllable beginning with voiceless oral obstruents and *w*, with *n* replacing *t* :

labials: *menehi* (*N-weneh-i*) ‘give’

*maṅan* (*N-paṅan*) ‘eat’

apicals: *nəmu* (*N-təmu*) ‘find’

*noṭok* (*N-ṭoṭok*) ‘knock’

laminals: *ṅilih* (*N-silih*) ‘borrow’

*ṅəgah* (*N-čəgah*) ‘prevent’

dorsals: *ḡəkəp* (*N-kəkəp*) ‘embrace’

- as ‘Ø’ (i.e., there is no prefix) before nasals:

*maliṅ-i* (*N-maliṅ-i*) (undergoer pivot/passive: *di-maliṅ-i*)

*nunut-i* (*N-nunut-i*) (undergoer pivot/passive: *di-nunut-i*)

2. When the suffixes *-ʔke*, *-ni* and *-n* are suffixed to a vowel-final stem, that vowel is lowered if it is high. This can be motivated phonologically by assuming the underlying forms are  $\{aʔke\}$ ,  $\{ani\}$ , and  $\{an\}$  respectively:

$\{ruṅu+aʔke\}$	<i>ruṅʔke</i>	‘listen’ /ruṅʔke/
$\{turu+an\}$	<i>turən</i>	‘lie down’ /turon/
$\{pa+roti+an\}$	<i>parotən</i>	‘oven’ /paroten/
$\{təmu+ani\}$	<i>təməni</i>	‘find’ /təmoni/

There are good synchronic grounds for this assumption in the case of  $\{an\}$ , and diachronic ones in the case of  $\{ani\}$ : *-ani* is a surface form in Old Javanese. Similarly, forms such as *kelaṅan* can be presumed to derive from underlying  $\{ka+ilaṅ+an\}$ .

### 3. Orthography

There are two main writing systems, the *Aksara* and Roman scripts. The traditional *aksara* script, which has evolved over more than 1200 years, derives indirectly or directly from a Pallava script of southern India (de Casparis 1975). Forms of it are also used to write Sundanese, Madurese, Balinese and Sasak. Roman script is more commonly used now. This was last revised in 1974, following the revision of the Indonesian alphabet.

The traditional script is largely phonemic, assuming a six-vowel system. All phonemes except /a/ are represented by graphemes; /a/ is the “default” vowel: it is not normally represented, as in Indian scripts. For this reason, and perhaps also because certain phonemes are represented by more than one

grapheme according to whether they occur syllable-initially or finally, the script is sometimes said to be syllabic.

The roman script is phonemic, assuming a six-vowel system, except that:

- grapheme *e* represents both /ə/ and /e/.
- *n* also represents /ñ/ before /č/ and /j/
- prefixes of the form /Cə/ (including those formed by reduplication of the initial syllable of the stem) are written *Ca* ;

Note also that:

- the digraph *ng* represents /ŋ/, *ny* represents /ñ/ before vowels.
- the digraphs *th* and *dh* represent the corresponding apico-alveolars/retroflexes.

Javanese has a long literary tradition, and this has had a conservative influence on both orthographies. For example, the verb suffix *-(?)ke* is represented as *-(k)ake*, and prefixes of form /Cə/ are represented as *Ca*. Very formal spoken Javanese preserves the pronunciations [(?)ake] and [Ca]. Also, formerly “underlyingly voiced” morpheme-final consonants (see 2.1.3, above) are written as voiced, whether or not they occur as such in speech (see also 2.1.3 on intervocalic *w* and *y*).

#### 4. About the word list

##### Verb citation forms

Transitive verbs are cited in the “actor pivot” or “active” form (that is, prefixed by the appropriate realisation of the morpheme *N-*, since this form best translates the headword). The stem is given in brackets, where it is not immediately recoverable from the morpheme breaks indicated. Some intransitive verbs are also prefixed with *N-*.

Morpheme breaks are generally indicated, except where their synchronic status is questionable, e.g. *lodan* ‘whale’, historically (*iwak*) *lod-an* ‘sea fish’: synchronically a separate morpheme *lod* is no longer found.

## 23. Madurese

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>Adrian Clynes</i>
---------------	----------------------

Wordlist:	<i>Subandi Djajengwasito – Abdul Syukur Ghozali</i>
-----------	---

---

### 1. Introduction

---

Madurese is spoken by approximately 9 million people. This figure is arrived at based on the 1980 census (the last census for which language used in the home was surveyed), when just under 5% of the population indicated that Madurese was their first language, and an estimate of the current (1990) Indonesian population at 180 million. Around one third of these are said to live on the island of Madura itself, and the rest on adjacent areas of the eastern salient of Java (Stevens 1968: 2). Smaller settlements of Madurese speakers are found on island groups to the north and east of Madura, such as Bawean and Sapudi. Around 200,000 Madurese speakers are found in Kalimantan (three-quarters of them in West Kalimantan province) due to transmigration.

Madurese was sub-grouped with Javanese, Sundanese and Malay by Dyen (1965), on lexicostatistical grounds. This in turn was the basis for Nothofer's reconstruction of a putative "Proto-Malayo-Javanic". Blust (1981) argues against Dyen's sub-grouping. Nothofer (1985) proposes that Madurese sub-groups with Lampung, Malay, Iban, Sundanese and Javanese, with the first five languages more closely related to each other than they are to Javanese.

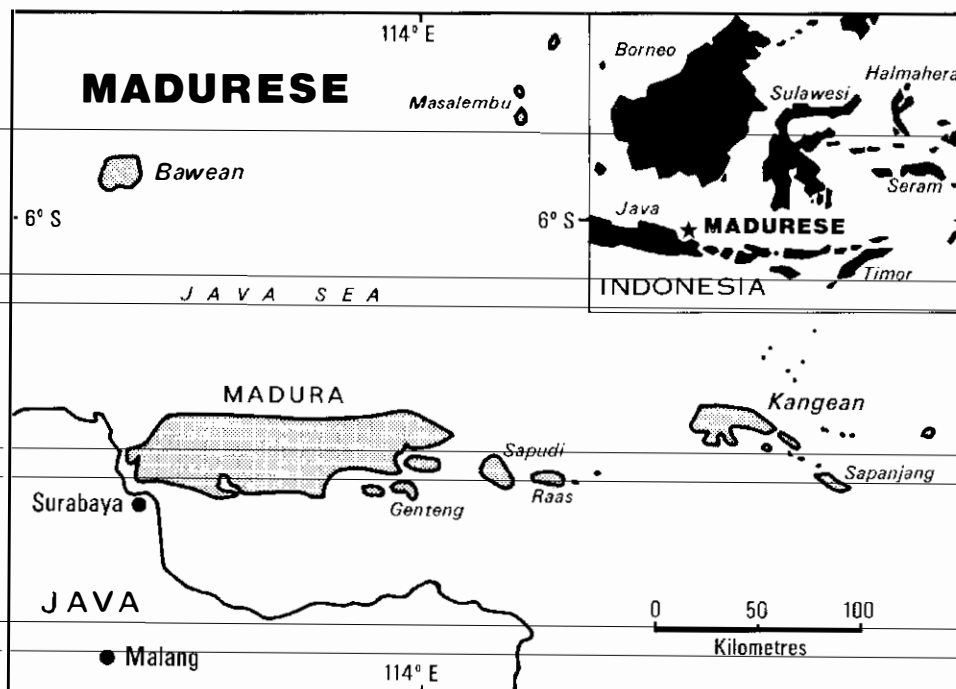

Three main dialects are recognised: Western (sub-dialects Bawean and Bangkalan), Central (Pamekasan and Sampang) and Eastern (Sumenep, Sapudi), though Stevens (1968: 4) refers to a dialect continuum extending from one end of the island through to the Sapudi islands in the east. Because of the flat terrain and general lack of geographical or other barriers to communication, variation is said to be relatively limited (Soegianto et al 1986). The variety spoken on the Kangean islands is said to be "barely understandable" by East Madurese speakers, sharing only 75% cognates using a 200-word Swadesh list. Stevens lists it as a separate language (Stevens 1968: 4). The dialect of the capital, Sumenep, located in the east, is the basis for standard Madurese (the variety taught in schools and used in the media). Some dialectal information is found in Kiliaan (1897), Stevens

---

---

(1968), and Soegianto et al. (1986). Dialects spoken on Java have not to our knowledge been the object of detailed study, but are said to vary with the origin (on Madura) of the particular community.

Madurese, like Javanese and Balinese, is characterised by “speech levels”, or distinct formal and informal registers, in which social distance and differences in the relative status of the speaker and the person referred to are expressed by lexical choices. From the phonological shapes of items in the “high” lexis it is clear that it was borrowed virtually entirely from Javanese (Stevens 1965, 1968; Nothofer 1975: 34). In the wordlist below only items from the low lexis are listed.

Map 23. Madurese language area

Madurese has a higher cognate count with Malay than do Javanese or Sundanese. It has been surmised that this is due to borrowing (by Dyen; see Stevens 1968: 2, also Blust 1981). Borrowings deriving from Javanese, Arabic, Dutch and other languages are indicated in the comparative wordlist where known.

Stevens (1968) contains a review of previous work on Madurese, which is mostly in Dutch. Kiliaan (1897) is the only attempt at a full-scale scientific grammar. Kiliaan's dictionary (1904) is the basis of later works by Penninga and Hendriks (1913) and Safioedin (1977). Stevens (1968) is a valuable generative analysis of the phonology and morphology of Madurese

(Sumenep variety). Recent work in Indonesian includes Moehnilabib et al. (1979) and Soegianto et al. (1986).

## 2. Sketch of phonology and morphology

### 2.1 Phonology

The Madurese phoneme repertoire is similar to those of other Western Indonesian languages. In the inherited vocabulary a four-vowel system is still found, whereas neighbouring languages have expanded to a six- or (arguably, for Javanese) an eight-vowel system. In the consonant repertoire Madurese shares with Javanese a phonemic distinction between apico-dentals and apico-alveolars (“retroflexes”) not generally found in the area. Other unusual features are an aspirated stop series, and phonemic consonant gemination.<sup>1</sup>

#### 2.1.1 Consonants

The consonant phonemes in the inherited portion of the lexicon are:

	Labial	Apico-dental	Apico-alveolar	Laminal	Dorsal	Glottal
Stop/Affricates	vl	<i>p</i>	<i>t</i>	<i>t̚</i>	<i>č</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>d̚</i>	<i>ǰ</i>	<i>g</i>
	asp	<i>b<sup>h</sup></i>	<i>d<sup>h</sup></i>	<i>d̚<sup>h</sup></i>	<i>ǰ<sup>h</sup></i>	<i>g<sup>h</sup></i>
Fricativeness				<i>s</i>		
Nasals	<i>m</i>	<i>n</i>		<i>ɲ</i>	<i>ŋ</i>	
Laterals		<i>l</i>				
Vibrants		<i>r</i>				
Glides	<i>w</i>			<i>y</i>		<i>ɿ</i>

1. The discussion below is based on Stevens (1968), supplemented with data from the wordlist, and from Safioedin (1977) and Penninga – Hendriks (1913). Note that Stevens’ analysis is in terms of underlying “symbols”, plus rule statements generating surface forms: it does not recognise a separate phonemic level. Here an attempt is made to restate Stevens’ rules in phonemic terms though, as he shows, a classical phonemic analysis is unsatisfactory in a variety of ways (see 2.1.3).

Note that below only the phoneme system of the inherited portion of the lexis is discussed. As is indicated, a larger phoneme repertoire is needed to account for the borrowed element of the lexicon. We refer the reader to Stevens (1968) for a description of phonotactic constraints.

All the consonant phonemes with the exception of /ʀ/ also occur as geminates, e.g. *bad<sup>ba</sup>* ‘exist, be’, *badd<sup>ba</sup>* ‘container’.

– Stevens characterises the oral stops in the following ways (i) voiceless: “voiceless, tense” (ii) voiced: “voiced, lax” (iii) aspirate: “voiceless, with indifferent tension, followed by strong aspiration” (1968: 38). Fagan’s (1988) instrumental analysis of the Javanese phonemes /b, d, d̥, g/ suggests that the Madurese “aspirated” series may better be described as “lax voice” or “whispery voiced”, though this needs investigation. As a class the aspirates pattern with voiced stops, e.g. in the allomorphy of following vowels, and in phonotactic distribution.

– /k/ and /ʀ/ are distinct phonemes, e.g. *əmbɔʔ* ‘mother’, *əmbok* ‘elder sister’.

– Stevens (1968: 24) establishes three distinct classes of consonants, according to (in phonemic terms) the patterns of vowel allophony associated with each. They are: “higher determinants” (D<sub>H</sub>), “lower determinants” (D<sub>L</sub>), and “neutral determinants” (D<sub>N</sub>). By our analysis, these have the following membership:

D<sub>H</sub>: voiced and aspirated oral stops.

D<sub>L</sub>: voiceless oral stops, nasal stops, intervocalic /s/.

D<sub>N</sub>: liquids, glides<sup>1</sup> and morpheme-initial and -final /s/.

These classes are discussed in the following sub-section.

### 2.1.2 Vowels

In inherited vocabulary Madurese has 4 vowel phonemes,<sup>2</sup> each of which has two principal allophones, one high, one low, as indicated in the following chart:<sup>3</sup>

	Front	Central	Back
High	i ([i], [e])		u ([u], [o])
Mid		ɔ ([i], [ə])	
Low		a ([ɐ], [a])	

1. Stevens classifies the symbols *w* and intervocalic *y*, which only occur in loans, as D<sub>H</sub>. Our /w/ and /y/, occurring in inherited lexis, are distinct from these.
2. This accounts for more than 95% of the lexicon. However, when the borrowed element in the lexicon is taken into consideration, 9 vowel phonemes are needed. These are (i) high vowels: /i/, /ə/, /u/, (ii) mid vowels: /e/, /ɐ/, /o/ and (iii) low vowels: /ɛ/, /a/, /ɔ/; see Stevens (1968: 18).
3. See Stevens (1968: 36-38) for a detailed statement of surface allophony.

- VV sequences occur, but always represent two distinct syllables.
- Height of vowel allophones is in general determined by the nature of the preceding segment:

- a) High vowel allophones occur after D<sub>H</sub> consonants (see 2.1.1), and after immediately preceding high-allophone vowels:

/baba/ [bæbæ] ‘under’	/ɖuwa/ [ɖuwæ] ‘two’
/biɖik/ [biɖik] ‘woven bamboo’	/ʃjau/ [ʃjɛu] ‘far’

- b) Low vowel allophones occur after D<sub>L</sub> consonants, word-initially, and after immediately preceding low-allophone vowels:

/pittuʔ/ [pettoʔ] ‘seven’	/tuwa/ [towa] ‘old’
/inum/ [enom] ‘drink’	/pau/ [pao] ‘mango’

- c) D<sub>N</sub> consonants do not influence allophony. Segments preceding a D<sub>N</sub> consonant determine the allophonic realisations of the following vowel:

/bulu/ [bulu] ‘body hair’	/pulu/ [polo] ‘ten’
/tuwa/ [towa] ‘old’	/ɖuwa/ [ɖuwæ] ‘two’

In the same way, the vowel after a word-initial D<sub>N</sub> consonant behaves as though it were itself word-initial:

/limaʔ/ [lemaʔ] ‘five’	/sibu/ [sebu] ‘thousand’
------------------------	--------------------------

- Morpheme-initial VV sequences are predictably nasalised:

/ias/ [ēās] ‘decorate’	/aiŋ/ [āēŋ] ‘water’
------------------------	---------------------

- Nasal vowel allophones also occur after nasal consonants. Nasality spreads across glides:

/maus/ [māõs] ‘read’ (Javanese)	/niyat/ [nēyāt] ‘intention’ (Arabic)
/nasiʔ/ [nāseʔ] ‘rice’	

### 2.1.3 Phonemic versus generative analyses

A strictly phonemic analysis requires that a variety of segments whose presence is predictable in certain environments be nonetheless assigned phoneme status, since in other contexts they have this status:

homorganic glides are always inserted between non-identical /uV/ and /iV/ sequences:

/čiyum/ [čeyom] ‘sniff’                      /buwa/ [buwa] ‘fruit’  
 /palabb<sup>h</sup>uwan/ [palabb<sup>h</sup>uwən] ‘port’    /bagiyan/ [bəgiyən] ‘part’

– [ʔ] is always inserted between identical vowel sequences:

/tuʔut/ [toʔot] ‘knee’                      /liʔir/ [leʔer] ‘neck’

– Consonant length is predictable (non-contrastive) when intervocalic after schwa: e.g. [təmmu] ‘meet’, [ləssu] ‘tired’, and before a liquid: [suttra] ‘silk’ (Sanskrit), [passra] ‘hand over’.

The evidence from the orthography, and from morphological processes such as reduplication indicates that these segments have phoneme status in the minds of native speakers. The most common type of reduplication is where the final syllable of the stem is copied:

/abbər/ ‘fly (v.itr.)’ > /bər-abbər/ ‘insect’ (*RED+abbər*)

As in the above example, this is a derivational process. Reduplication of [buwa] ‘fruit’, plus suffixing of the nominal affix *-an* produces the form:

[waʔ-buwaʔ-an], /waʔ-buwaʔ-an/, ‘different kinds of fruits’

For reduplication the second syllable of the stem is thus analysed to be /waʔ/, even though the presence of the segments *w* and *ʔ* is predictable in their respective environments. The orthography writes out these glide segments.

Similarly, we assign phoneme status to [w] and [y] off-glides occurring across morpheme boundaries, as in /palabb<sup>h</sup>uwan/ [palabb<sup>h</sup>uwən] ‘port’ (from /pa+labb<sup>h</sup>u+an/) and /bagiyan/ [bəgiyən] ‘part’ (from /bagi+an/). These are always represented in the orthography.

A generative analysis such that of Stevens (1968) excludes all the predictable elements above from the underlying representation of each morpheme, generating them by late rules.

## 2.2 Morphology

Madurese is an agglutinating language. Bound morphemes occurring in the wordlist, with summary descriptions of their function, include the following derivational affixes:<sup>1</sup>

1. For a fuller account, see Stevens (1968).

### 2.2.1 Verbal affixes

- N-* (~ *a-*, see morphophonemic alternations) marks “active” transitive verbs and a subclass of “dynamic” intransitive verbs.
- a-* marks intransitive verbs, with meanings ‘perform action of (root)’, ‘own, have, use (noun stem)’.
- pa-* derives causitive transitive verbs. In the wordlist they occur as *ma-* (*N-pa-*).
- ta-* marks verbs where the action is carried out unintentionally, or without a specified agent.
- i* marks transitive verbs. It typically specifies the semantic role of the undergoer NP as LOC (location, goal, recipient).
- ag<sup>hi</sup>* marks transitive verbs. It typically further specifies the semantic role of the undergoer NP as “circumstantial” (benefactee, causee, thing transferred). Where the root is already transitive (e.g. verbs of perception), it can signify deliberate effort on the part of the actor/agent.
- ka- -an* marks verbs with the meaning ‘be affected by (stem)’.

### 2.2.2 Nominal affixes

- an* derives nouns from nominal and verbal stems.
- pa- -an* derives nouns from nominal and verbal stems, with meanings ‘place for (stem)’, ‘person/thing which does (stem)’, ‘the action of (stem)’.
- na* links two nominals in a “genitive” or “associative” relationship to form a compound e.g. *ǰila-na apuy* ‘tongue-*na* fire’, i.e. ‘flame’. (see also 2.2.4).

### 2.2.3 Reduplication

Reduplication can target the final syllable (*RED*) or the initial syllable (*RF*) of the stem, as well as the entire stem. Reduplication can be used to derive both verbs and nouns.

*RED*: This derives nominals e.g. from *tumbu* ‘grow’, *bu-tumbu* ‘kind of disease’, *bu-tumbu-an* ‘plants’ (from *RED-tumbu-an*). With derived verbs *RED* indicates repetition.

*RF*: In the wordlist this derives nominals: *mamatan* ‘jewel’ (*RF-mata-an*), *mata* ‘eye’.

## 2.2.4 Morphophonemic alternations

Alternations encountered in the wordlist include the following:

The verbal prefix *N-* (2.2.1) has the following realisations:

– /ŋ/ before vowels:

*ŋ-aku* ‘confess’, *ŋ-uan* ‘to herd’

– /ŋə/ before monosyllabic bases:

*ŋə-čap* ‘stamp’

– as the homorganic nasal (with nasal substitution) before bases of more than one syllable beginning with a voiceless oral obstruent:

labials:

*məɖaŋ (N-pəɖaŋ)* ‘hit with a sword’

apicals:

*nutup (N-tutup)* ‘close’

*nattəŋ (N-ɬattəŋ)* ‘be wide open’

laminals:

*ñuču (N-čuču)* ‘stab’

*ñoso (N-soso)* ‘feed at the breast’

dorsals:

*ŋirim (N-kirim)* ‘send’

– as /a/ before nasals or liquids:

*a-naŋala* ‘plough’

*a-rusak* ‘break’

– as either the homorganic nasal (with substitution), *a-*, or (very rarely) *aN-*, before voiced consonants:

*massa-i, a-bassa-i* ‘wash’

*a-b<sup>h</sup>ab<sup>h</sup>aʃa-i, am-b<sup>h</sup>ab<sup>h</sup>aʃa-i* ‘endanger’

*ŋib<sup>h</sup>a, a-g<sup>h</sup>iba* ‘carry’

(For details, see Stevens (1968: 84-95).)

– *ag<sup>h</sup>i* (2.2.1): stem final consonants to which *-ag<sup>h</sup>i* is affixed are doubled:

*kabarrag<sup>h</sup>i* ‘report (vb.trans)’, *kabar* ‘news’

– *na* (2.2.2): Where the head nominal to which *-na* is affixed ends in a consonant, the initial segment of *-na* assimilates totally:

*təlur-ra kutu* ‘egg-*na* louse’, i.e. ‘nit’

*tubaŋ-ŋa iluŋ* ‘hole-*na* nose’, i.e. ‘nostril’

– *an* (2.2.2): occurs as *-wan* after stem-final /u/, and *-yan* after stem-final /i/:

*palabb<sup>h</sup>uwan* [palabb<sup>h</sup>uwən] ‘port’, *bagiyan* [bəgiyəŋ] ‘part’

(see discussion, 2.1.3).

### 3. Orthography

There are two writing systems, the traditional *Aksara*, borrowed from Java and deriving ultimately from southern India, and Roman script, more commonly used now.

The roman orthography was last revised in the 1970s, on the model of that of Indonesian. Some features are:

- *o* represents [o], *e* represents [e] and [ə]. Other vowel symbols used are *i*, *u* and *a*. (Diacritics are used in the dictionaries to distinguish [a] and [ɐ], but not [ə] and [i].)
- glides where predictably inserted are always written.
- glottal stop is written as *q*.
- gemination is always written.
- apico-alveolar stops and apico-dentals are usually not distinguished.
- aspirated and non-aspirated voiced stops are usually not distinguished.
- *n* also represents /ñ/ before /č/ and /ǰ/.
- the digraph *ng* represents /ŋ/, *ny* represents /ñ/ before vowels.

### 4. About the wordlist

#### Citation forms

Transitive verbs are cited in the “actor pivot” or “active” form, that is, prefixed by the appropriate realisation of the morpheme *N-* (see 2.4.1, 2.5), since this form best translates the headword. The bare stem is given in brackets only where it is not immediately recoverable from the morpheme breaks indicated. Some intransitive verbs also carry *N-*; however the stem in this case is always bound.

Morpheme breaks are indicated, except where their synchronic status is questionable.

Wordlist:	<i>I Wayan Bawa – Adrian Clynes</i>
-----------	-------------------------------------

---

### 1. Introduction

---

Balinese is the native language of the island of Bali, Indonesia. In 1980, the last census for which language spoken was surveyed, just under two and a half million people indicated they spoke Balinese in the home. At current rates of population increase, there are now around 2,900,000 speakers of Balinese. Of these, around 80,000 live on the neighbouring island of Lombok while, largely due to transmigration, 40,000 speakers are found in southern Sumatra, and 60,000 in Sulawesi.

Balinese was sub-grouped with Sasak and Sumbawanese by Esser (1938), based on shared lexis and grammatical features, “especially the [verbal] suffixes *-an* and *-in*” (Noorduyn 1963: 336), and also by Dyen (1982), on lexicostatistical grounds. Blust (1985) refers to a “Java-Bali-Sasak” group, though without giving the basis for this analysis.

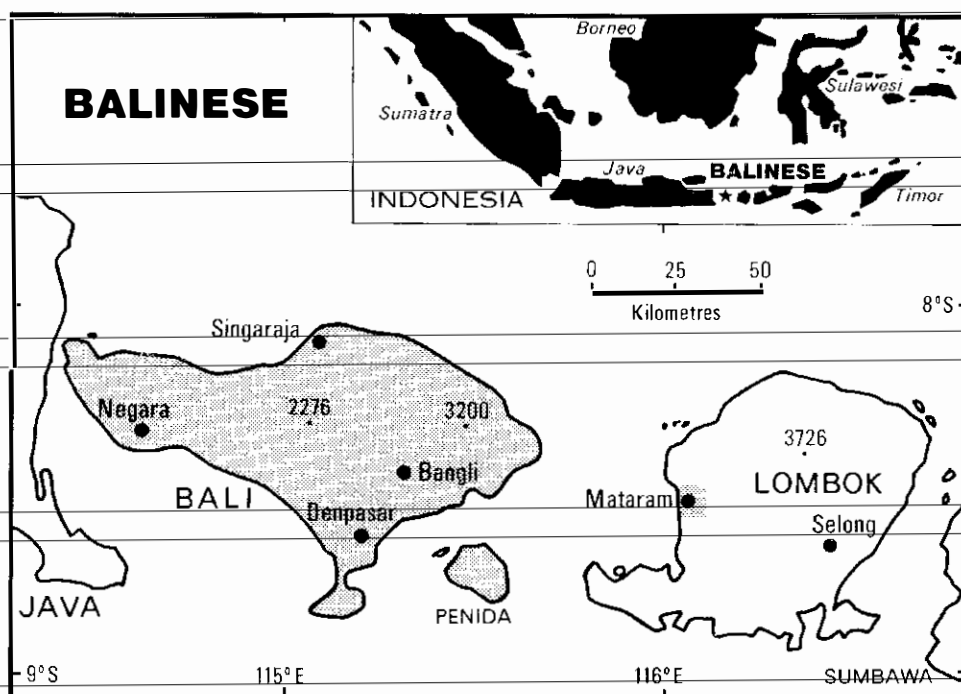

There is phonological and lexical variation across the island, though nearly all varieties are mutually intelligible. Dialectal studies include Bawa (1982), and Jendra (1976). A distinction can be made between the “mountain” or conservative (MNB) group of varieties on the one hand, and the “lowland” (LNB) varieties. MNB varieties are found largely but not entirely in the central mountainous area, and on the small island of Nusa Penida to the southeast. They lack certain phonological, morphological and lexical innovations found in the LNB varieties, which were influenced by contact with Old Javanese. It seems unlikely that MNB varieties constitute a homogeneous sub-group, given their wide geographical spread. For ease of discussion, LNB varieties are often further distinguished according to the present-day regional capitals, which were formerly court centres: Klungkung, Karangasem, Buleleng, Gianyar, Badung, Tabanan and Negara. In fact the situation is more complex than this, with noticeable lexical and phonological variation sometimes occurring over distances of less than a few kilometres. The greatest difference within the LNB varieties is between those spoken in the north and east (the basis for the “Standard Balinese” of newspapers and

---

---

broadcasting) and the varieties of the Denpasar area in the south. Denpasar Balinese is characterised by a loss or neutralisation of verbal and nominal suffixes found elsewhere (see below, morphology).

LNB varieties are characterised by “speech styles”, or distinct formal and informal registers. In formal registers social distance and differences in the relative status of the speaker and the person referred to are expressed by lexical choices. Almost any utterance is marked in terms of the perceived social relationship obtaining between the speaker and the addressee/person referred to. Virtually all Balinese practise a variety of Hinduism, and the primary status determinant has traditionally been caste. Correct use of speech styles is thus a part of correct expression of caste-related status distinctions. (Though see Bagus 1979 on the effect of social change on

Map 24. Balinese language area

styles usage). Speech styles were borrowed from Javanese, and the membership of all but the low lexical class consists virtually entirely of Javanese borrowings (Clynes 1989). In the wordlist only items from the low lexis are included

Apart from borrowings from Javanese, there is a significant Sanskrit element in LNB varieties, as well as borrowings from other languages such as Malay, Dutch, Portuguese and Chinese. Most of the latter borrowings can

be presumed to have come via Malay, recently. Borrowings from Javanese largely ceased after the 16th century (Clynes 1989). We have indicated borrowings in the list where known, though often it is impossible to determine whether a particular word derives from Javanese or Malay. Moreover, because of the similar phonologies of the three languages, borrowings cannot always be identified.

The earliest known texts in Balinese are the royal decrees inscribed on copper/bronze plaques from the 9th to the 11th centuries. The language of these texts (about ten thousand words in all) is referred to as Old Balinese (OB). Goris (1954) contains almost all known OB texts, with his translations into Dutch, as well as a glossary, proposing glosses for all OB words occurring in the texts, and distinguishing OB from Old Javanese (OJ) and Sanskrit items. There is clear OJ influence in these texts, hence occurrence of an item in an OB text is not always proof that it belongs to the native OB lexis. Some OB items are given in the wordlist and identified as such.

Major phonological changes since the OB period include the lenition of OB /r/ to /h/ everywhere, except in /Cr/ sequences, and the subsequent loss of /h/ initially and, in LNB, intervocally. In MNB /h/ is retained intervocally: see OB *b̄aras* > MNB *b̄ahas*, LNB *baas* (with subsequent vowel assimilation). This lenition of /r/ was just beginning in the OB period (or just finding its way into the orthography). Due to the large influx of Javanese borrowings from then to the 16th century, *r*-lenition appears to have been braked before working fully through the lexicon, leaving a residue of exceptions (Clynes 1989). Hence the presence of /r/ in “illegal” environments (anywhere other than after a consonant) is an indication, but not absolute proof, that an item is a borrowing. Another change characteristic of LNB, but not MNB, is OB /a/ > /ə/ word finally (see 2.5, morphophonemic alternations).

Previous work on Balinese not already mentioned includes sketch grammars by Kersten (1948, revised and translated into Indonesian 1970, 1984), Barber (1977), Anom (1983). All leave significant areas of the phonology, morphology and syntax untreated. Ward (1973) analyses aspects of the phonology and morphology, Hunter (1988) features of morphology, syntax, and discourse. A more comprehensive descriptive grammar is forthcoming (Clynes, in preparation). Dictionaries include Warna (1990) and Kersten (1984), both Balinese-Indonesian, as well as Barber (1979) and Shadeg (1977), both Balinese-English, and Balai Penelitian Bahasa Singaraja (1975), Indonesian-Balinese. The main dictionary of Old Balinese is Goris (1954). Oka Granoka (1985) is largely based on this.

## 2. Sketch of phonology and morphology

### 2.1 Phonology<sup>1</sup>

#### 2.1.2 Consonants

*Table 1. Consonants*

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	
	vd	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>	
Fricatives				<i>s</i>		<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ñ</i>	<i>ŋ</i>	
Laterals			<i>l</i>			
Vibrants			<i>r</i>			
Glides		<i>w</i>		<i>y</i>		

Both apical and laminal series are realised in the alveolar region. (LNB Balinese does not follow the common West Indonesian pattern in having an alveolar, not dental, realisation of /t/).

#### 2.1.2 Vowels

LNB has 6 vowel phonemes:<sup>2</sup>

*Table 2. Vowels*

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

1. This description is based on the variety in Peguyangan, Singaraja, Buleleng.
2. There may be a case for assigning phoneme status to the segment [ɛ] when it occurs in the third-person possessive morpheme, [-nɛ]. In some varieties this appears to contrast with /-ne/, an allomorph of the 'DEF' nominal suffix. More information is needed on the phonological behaviour of both morphemes in given varieties to confirm this. If /ɛ/ does occur here, it would be a case of a phoneme manifesting itself in a single lexical item, but one of very high functional load. A generative analysis, deriving {nɛ} from the underlying segments /ne/, may be a better reflection of the status of [ɛ]

VV sequences are common, but always represent two distinct syllables. Compare *ṅə-tis* (*N-tis*) 'rest in the cool' vs *niis* (*N-tiis*) 'drain (vb.trans)', where the form of the nasal prefix *N-* depends on the number of syllables in the root, see 2.5. below.

## 2.2. Syllable and root structure

In the native lexis a syllable has the structure (C)(L)V(C) where only V is obligatory, and L (= /l/ or /r/) does not occur in monosyllables.

The minimal form of a phonological word (one which carries stress) is CV. Grammatical words of structure (C)V(C) also occur (see 2.3). The majority (more than 90%) of root morphemes are disyllabic, with preferred structures CVCV(C) and CVNVC(C). A liquid may occur before one but not both vowels. Disyllabic morphemes of structure (C)VV(C) are also common. These possibilities can be summed up in the formula:

$$C_1LV_1NC_2LV_2C_3$$

where all segments are optional except  $V_1$ . Constraints on the phonemes which may occur in each position are indicated in the following two subsections.

A second possible (disyllabic) structure is a reduplicated  $C_1(L)V_1C_3$  sequence, i.e.

$$C_1(L)V_1C_3C_1V_1C_3$$

Morphemes of this second structure often have onomatopoeic or otherwise iconic meanings, see the examples below.

### 2.2.1 Phonotactic constraints on consonants:

#### Initial, medial and final position

All consonants may occur syllable initially (i.e. in  $C_1$  and  $C_2$  positions), except /h/, which only occurs finally. In syllable final ( $C_3$ ) position the following do not occur: laminal stops, /w/ and /y/.

## Constraints on glides

Initial /w/ and /y/ occur largely in loans. /w/ generally does not occur before or after back vowels,<sup>1</sup> and /y/ generally does not occur before or after front vowels. Two qualifications to these restrictions are:

- 1 Medially a high glide optionally occurs between VV sequences where the first vowel is /i, e, u/ or /o/:

*iis* ‘slice’: [iis] ~ [iyis]      *leak* ‘witch’: [leaʔ] ~ [leyaʔ]  
*uəd* ‘origin’: [uəd] ~ [uwəd]      *tuak* ‘palm wine’: [tuaʔ] ~ [tuwaʔ]

2. In the Denpasar - Gianyar region, word-initial /wo/ and /wu/ sequences do occur sporadically. Thus *oon* ‘tired’ is [oon] in most varieties but in Denpasar /won/ varies with /oon/.

## Consonant clusters

The principal medial clusters allowed in simple roots (as opposed to those containing a reduplicated C(L)VC sequence) are NC (a nasal homorganic with a following oral stop, or /ŋ/ if C<sub>2</sub> = /s/)<sup>2</sup> and, more rarely, NCL:

*bambaŋ* ‘hole’                      *klaŋsah* ‘woven palm leaf’  
*kamplaŋ* ‘hit’                      *paŋkriŋ* ‘cage’

However where roots consist of a reduplicated C<sub>1</sub>(L)V<sub>1</sub>C<sub>3</sub> sequence; any consonants acceptable in C<sub>1</sub> and C<sub>3</sub> position can cluster medially:

*tləktək* ‘inspect carefully’      *səlsəl* ‘regret’  
*ñahñah* ‘dry roast’              *ñiŋñiŋ* ‘baby mouse’

## Constraints on liquids

Only one of the L slots may be filled in a two-syllable root, that is L may occur in either first or second syllable, but not in both. In bases formed from reduplicated C(L)VC sequences, L occurs only in the first syllable:

*črukčuk* ‘kind of bird’              *sluksuk* ‘weave in and out of a crowd’

In CL sequences, C may not be a liquid or a glide.

1. Except word-initially in some loans.

2. An alternative analysis is to treat these as unitary pre-nasalised phonemes. See Clynes (in preparation).

## Consonant harmony

For morphemes of a structure  $C_1V(N)C_2V(C)$ , there are constraints of consonant harmony similar to those reported by Adelaar for Malay (1983) and Uhlenbeck for Javanese (1950, 1978). That is, with very few exceptions, if  $C_1$  is an obstruent or nasal, and  $C_2$  is of the same place of articulation and an obstruent, nasal or  $w$ , then  $C_2$  must also agree with  $C_1$  in manner of articulation (ie,  $C_2$  must be identical to  $C_1$ ). Thus morpheme-internal sequences like  $bVpV(C)$ ,  $pVwV(C)$ ,  $kVŋgV(C)$  etc are either exceptional or simply do not occur. (This constraint does not apply to  $t$ -initial morphemes, in agreement with Adelaar's findings for Malay. However it does apply to  $d$ -initial morphemes.)

## Reduplicated forms

Lexemes formed from reduplicated disyllabic morphs behave as a sequence of two phonological words, e.g. *lumbə-lumbə* 'porpoise', *lumba-lumba-ne* 'the porpoise' (/a/ normally alternates with /ə/ only word-finally, see Section 2.5); also *čiplak-čiplak* 'slurp (vb.intrans)' [čiplaʔčiplaʔ], not \*[čiplakčiplaʔ].

### 2.2.2 Phonotactic constraints on vowels

#### Vowel harmony

There is a strong tendency for harmony in the height of front and back vowels, such that where  $V_1$  and  $V_2$  are both non-central (i.e. not /a/ or /ə/), they agree in height, regardless of whether consonants intervene medially. There are thus very few non-borrowed morphemes with  $V_{HI}(N)(C)V_{MID}$ ,  $NON-CENTRAL$ , and  $V_{MID}, NON-CENTRAL(N)(C)V_{HI}$  sequences in the disyllabic morphemes listed in Warna et al (1978).

#### A constraint on schwa

Sequences of the form /əV/ do not occur. Where such sequences were created by the loss of medial  $r$  historically, total assimilation to the following vowel has occurred e.g. OB *bəras* 'rice' > NB *baas*; OB *təriŋ* 'bamboo' > NB *tiŋ*.

### Word-final \*/a/

Due to a historical change which has occurred in LNB varieties, \*/a/ > [ə] word-finally, [a] never occurs in this position (see also 2.5). In LNB varieties, all word-final [ə] derive from this change. In most MNB varieties except on Nusa Penida, the change did not occur.

### 2.3. Stress

Stress is on the last syllable of a lexeme (consisting of root morpheme plus any affixes): *bapə* ‘father’ [ba’pə], *ḷagur-in* ‘punch repeatedly’: [ḷagu’rin]. Unstressed enclitics may then follow this. No function word of form V or CV carries stress. They instead cliticise to stress-bearing words to form a single phonological word, e.g.: *kə=tukad* [kətu’kad] ‘to (the) river’ *a=piring* [api’ring] ‘one plateful’. Suffixes can thus be distinguished from enclitics according to whether or not they take stress. For example, the bound morpheme *-e* ( ~ *-ne* after vowels), ‘DEF’, is phonologically a suffix, carrying stress: *bapane* [bapa’ne] ‘the father’, while *ə*, the third person agent marker on ‘undergoer pivot’ verbs, is an enclitic: *ḷagur-in=ə* ‘punched repeatedly by 3rd person(s)’: [ḷagu’rinə].

In the varieties spoken around Denpasar, stress always remains on the last syllable of the root, even when suffixes are added.

### 2.4 Morphology

Balinese is an agglutinating language. Bound morphemes occurring in the wordlist, with summary descriptions of their function, include the derivational affixes listed below.

#### 2.4.1 Verb affixes

*N-* : marks “active” or “actor pivot” (see Foley – Van Valin 1984) transitive verbs (those where the actor/agent NP is preverbal in the unmarked word order), and a subclass of “dynamic” intransitive verbs. For realisations, see Section 2.5.

‘Ø-’ : the unprefixed stem constitutes the “passive” or “undergoer pivot” form of a transitive verb (that where the undergoer NP is preverbal in the unmarked word order).

*mə-* : (~ *m-* before a vowel-initial stem) marks some intransitive verbs.

- an** : marks some intransitive verbs (typically those prefixed with *mə-*). It sometimes indicates plurality of the action, including where the action is carried out reciprocally: *mə-ǰagur-an* ‘punch one another, punch repeatedly’. Attached to a nominal base it can have a locative sense: ‘covered or affected by (base)’ e.g. *sayoŋ-an* ‘covered in fog’, *sayoŋ* ‘fog’. **-an** can be considered an allomorph of **-in**, and sometimes of **-aŋ**. For discussion see Clynes (in preparation).
- in** : marks (mainly) transitive verbs. It typically further specifies the semantic role of the undergoer NP as LOC (location, goal, recipient).
- aŋ** : marks (mainly) transitive verbs. It typically further specifies the semantic role of the undergoer NP as “circumstantial” (benefactee, causee, thing transferred). Where the stem is already transitive (e.g. verbs of perception), it can signify deliberate effort on the part of the actor.

#### 2.4.2 Nominal affixes<sup>1</sup>

**pə-** : nominaliser, with various meanings according to the stem:

1. where the stem is the “undergoer pivot” form of a transitive verb:
  - a) ‘object/person undergoing (vb)’ e.g. *pəbaaŋ* ‘gift’ (*baaŋ* ‘give’);
  - b) ‘the action of (vb)’ *pədum* ‘division’ (*dum* ‘divide’);
2. where the stem is the “actor pivot” form of a transitive verb, or a “dynamic intransitive”:
  - a) ‘object/person carrying out (vb)’: *pəŋaŋon* ‘cowherd’ (*N-aŋon* ‘herd (vb.trans)’); *pəŋiǰəŋ* ‘house guard, shrine of spirit which guards a house’ (*N-iǰəŋ* ‘guard a house (vb.intrans)’);
  - b) ‘the action of (verb)’ *pəŋrəsəp* ‘understanding’ (*N-rəsəp* ‘understand’);
3. where the stem is an intransitive verb:
  - a) ‘person who carries out the action of the stem’: *pə-dərəp* ‘person who helps harvest rice’ (*mə-dərəp* ‘help harvest rice (vb intrans)’);
  - b) ‘the action of (verb)’: *pərəren* ‘stopping’ (*mə-reren* ‘stop (vb intrans)’).

1. This analysis is based on data taken primarily from Kersten (1984).

*-an* : nominaliser, attaching to a variety of stems:

1. where the stem is a transitive or intransitive verb:

- (a) ‘thing which undergoes (verb)’ *duman* ‘share’ (*dum* ‘divide (vb.trans)’); *alapan* ‘harvest’ (*alap* ‘pick (vb.trans)’); *tagikan* ‘seat’ (*-tagak* ‘sit down (vb.intrans)’);
- (b) (less commonly) ‘thing/person which does (verb)’ : *kikih-an* ‘grater’ (*kikih* ‘grate (vb.trans)’); *antikan* ‘plant’ (*-antik* ‘grow (vb.intrans)’); *tututan* ‘follower’ (*-tutut-in* ‘follow (vb.trans)’);
- c) ‘the action of (verb)’ : *jaguran* ‘punch, hitting’ (*-jagur* ‘hit (vb.trans)’); *saṅkapan* ‘meeting’ (*saṅkəp* ‘hold a meeting (vb.intrans)’);

2. where the stem is a noun:

- a) thing like (noun): *adəṅan* ‘freckle’ *adəṅ* ‘charcoal’;
- b) place of (noun): *prəbəkəlan* ‘area of a *prəbəkəl*’ (*prəbəkəl* ‘village official’, *səkolahan* ‘school, school building’ ([*səkolah*] ‘school’ (Dutch)).

*pə-* and *-an* may co-occur, producing nominals with the meanings listed under *pə-* and *-an* above:

- 1) meanings given for *pə-* above (all except ‘the action of (verb)’), with the same relationship between meaning and the nature of the stem: *pəmanṅaṅan* (*pə-N-paṅgaṅ-an*) ‘oven’, *N-paṅgaṅ* ‘bake (actor pivot)’; *pə-turun-an* ‘payment’, from *pə-turun-in* ‘make a payment (undergoer pivot)’;
- 2) meanings given for *-an* above: ‘location (place or time) of (stem)’: *gəlaṅ* ‘bracelet’, *pəgəlaṅan* ‘wrist’; *ləkad* ‘be born’, *pələkadan* ‘birthplace, day of birth’; *mə-bakti* ‘pray’, *pəbaktian* ‘day or time for prayer’; *pə-sare-an* ‘bed’ *mə-sare* (vb.intrans) ‘lie down, sleep’.

*-n* : links two nominals in a “genitive” or “associative” relationship to form a compound e.g. *puña-n kayu* ‘plant-*n* wood’, i.e. ‘tree’. The suffix-*n* only occurs on vowel-final heads, since phonotactic constraints rule out Cn clusters. Compounds where the head nominal ends in a consonant simply conjoin the two elements e.g. *anak luh* ‘person-female’, i.e. ‘woman’.

**RED:** the first CV sequence of a stem may be reduplicated (with schwa) to form a noun. The stem may be a verb or a noun. Examples of derivations from verbs: *mə-botoh* ‘gamble’, *bəbotoh* ‘gambler’; *N-saṅi-aṅ* ‘make a vow’, *səsaṅi* ‘vow’. Meanings include both ‘thing/person doing (intransitive verb)’ and ‘thing/person undergoing (transitive verb)’.

Both *RED* and affixation of *-an* commonly co-occur: *dəmən-in* ‘like, love (vb.trans)’, *dədəmənən* ‘loved one’; *-daar* ‘eat (vb.trans)’ *dadaaran* ‘food’. On nominal stems the derived noun can have the meaning ‘thing like (noun)’: *buah* ‘fruit’, *babuahan* ‘kidney’.

## 2.5. Morphophonemic alternations

### Realisation of *N-*

The verbal prefix indicated in 2.4.1 as *N-*, (including the same element in verbal stems to which the nominal prefix *pə-* is attached, 2.4.2) has the following realisations:

– as /ŋ/ before vowels, liquids and semivowels:

<i>ŋ-iis</i> ‘slice’	<i>ŋ-orah-aŋ</i> ‘say’
<i>ŋ-lantig</i> ‘hit with a stick’	<i>ŋ-raab-in</i> ‘roof (vb.trans)’
<i>ŋ-wayay</i> ‘perform shadow puppets’	<i>ŋ-yeh-in</i> ‘water (vb.trans)’

– as /ŋə/ before monosyllabic bases, and all stems beginning with a nasal:

<i>ŋə-tis</i> ‘rest in the cool’ ( <i>tis</i> ‘cool’)	<i>ŋə-leb</i> ‘escape (of an animal)’
<i>ŋə-mati-aŋ</i> ‘kill’ ( <i>mati</i> ‘dead’)	<i>ŋə-nəŋnəŋ</i> ‘stare’

– as the homorganic nasal (with nasal substitution) before bases of more than one syllable beginning with an obstruent:

labials:	<i>mula</i> ( <i>N-pula</i> ) ‘plant (vb.trans)’	<i>maan</i> ( <i>N-baan</i> ) ‘obtain, get’
apicals:	<i>niis</i> ( <i>N-tiis</i> ) ‘drain’	<i>naar</i> ( <i>N-daar</i> ) ‘eat’
laminals:	<i>ñaçad</i> ( <i>N-čačad</i> ) ‘criticise’	<i>ñəmak</i> ( <i>N-ĵəmak</i> ) ‘take’
	<i>ñadin</i> ( <i>N-sadin</i> ) ‘believe’	
dorsals:	<i>ŋikih</i> ( <i>N-kikih</i> ) ‘grate coconut’	<i>ŋugu</i> ( <i>N-gugu</i> ) ‘believe’

### Deletion of morpheme-final *h*

In most varieties (except MNB, and Tabanan and Karangasem LNB), stem-final *h* is normally deleted when a suffix or enclitic follows:

<i>ambah</i> ‘path’ [ambah]	<i>ambah-in</i> ‘take a path’ [ambain]
<i>kikih</i> ‘grate’ [kikih]	<i>kikih-an</i> ‘grater’ [kikian]

In some varieties (e.g. parts of Klungkung) this /h/ can be realised in formal speech, and so the deletion can perhaps be considered a rapid speech elision.

In other varieties, stem-final /h/ is always lost in this context; the loss can therefore be analysed as a morphophonemic alternation.

### Word-final \*/a/

Historical word-final /a/ has undergone changes in LNB varieties. It is realised as [ə] in north and east Bali, and as [ɛ], [ɔ], [ʋ] or a similar central vowel in the Gianyar-Tabanan regions. Only MNB varieties have not undergone such changes, retaining [a] word finally. However, in all varieties when an enclitic or suffix is attached the realisation reverts to [a]. For example, *puñə* ‘plant’ [puñə] ~ [puñɔ] etc, but *puña-n kayu* ‘tree’ [puñankayu], all varieties. In the wordlist we use the “schwa variety”, and assume morphophonemic alternation when affixes occur. In words of a historical form /Caa#/, the penultimate vowel assimilates to the final: e.g. *bəə* [bəə] ‘embers’ but *baane* [baane] ‘the embers’.

### 3. Orthography

There are two writing systems, the traditional *Aksara*, borrowed from Java and deriving ultimately from southern India, and Roman script, more commonly used now. The traditional script is phonemic except that:

- prefixes of form /Cə/ (including those formed by reduplication of the initial syllable of the stem) are written as though they were /Ca/<sup>1</sup>, reflecting an earlier historical stage of the language; similarly, final /ə/ is represented as though it were /a/;
- graphemes originally used to write Sanskrit aspirates and retroflexes are used idiosyncratically in some personal and place names.

Similarly, the Roman script is phonemic except that:

- grapheme *e* represents both /ə/ and /e/;
- *n* also represents /ñ/ before homorganic stops;
- prefixes of form /Cə/ (including those formed by reduplication of the initial syllable of the stem) are written *Ca*;
- final /ə/ is represented as grapheme *a*;
- the digraph *ng* represents /ŋ/; *ny* represents /ñ/ before vowels.

1. All phonemes except /a/ are represented by graphemes; /a/ is the ‘default’ vowel: it is not normally represented. For this reason, and perhaps also because certain phonemes are represented by more than one grapheme according to whether they occur syllable-initially or -finally, the script is sometimes said to be syllabic.

#### 4. About the wordlist

##### Citation forms

Transitive verbs are cited in the “actor pivot” or “active” form (that is, prefixed by the appropriate realisation of the morpheme *N-*; (see 2.4.1, 2.5)), since this form best translates the headword. The bare stem (which is the form of the “undergoer pivot/passive” form and also of the imperative) is given in brackets, only where it is not immediately recoverable from the morpheme breaks indicated. Some intransitive verbs also carry *N-*. However, the stem in this case is always bound.

Morpheme breaks are indicated, except where their synchronic status is questionable. Thus *ambah-in* ‘take a path’, from *ambah* ‘path’, but *mənek* ‘go up’ derives synchronically from *N-pənek*, not \**N-pənek*, despite cognates such as *naik* (Malay).

##### Variants

Variant forms are sometimes given in the notes, though the geographical origin is not always indicated. If an item is marked as “south Bali”, this is usually an indication that it is found in Warna (1978) but not Kersten (1984). Similarly, an item listed as “north Bali” is one listed in Kersten (1984) but not Warna (1978).

## 25. Sasak

---

---

<b>Contributors:</b>
----------------------

Introduction: <i>Adrian Clynes</i>
------------------------------------

Wordlist: <i>Stamet Ryadi Ali</i>
-----------------------------------

---

### 1. Introduction

---

Sasak is the principal language of the island of Lombok, in the province of Nusa Tenggara Barat, Indonesia, spoken by perhaps 2 million speakers. Thoir (1984: 5) estimates that more than 90% of the population speak Sasak.

Sasak was sub-grouped with Balinese and Sumbawanese by Esser (1938), based on shared lexis and grammatical features “especially the [verbal] suffixes *-an* and *-in*” (Noorduyn 1963: 336). Dyen (1982) proposes the same sub-grouping, on lexicostatistical grounds. Blust (1985) refers to a “Java-Bali-Sasak” group, though the basis for the grouping is not given.

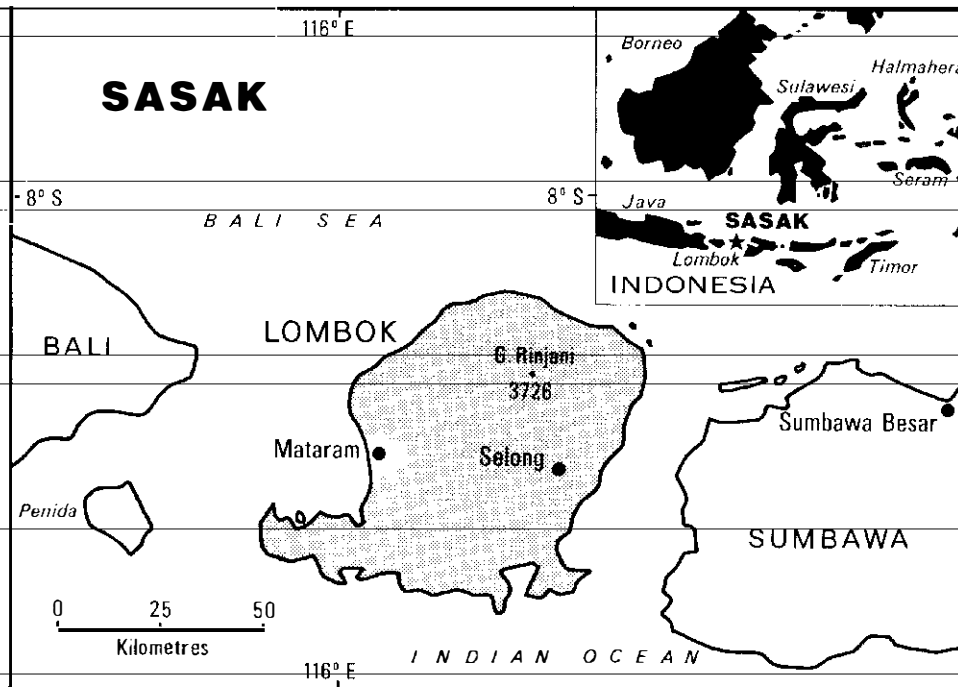

A dialect survey was carried out by Teeuw (1951, 1958). Teeuw’s work indicates a considerably more complex pattern of dialectal divergence than is indicated by the traditional classification into five major dialects: *ngeno-ngene* (spoken on both the central-west coast and the central-east to north-east coast), *meno-mene* (around the town of Pejanggik, central Lombok), *mriak-mriku* (central-south area around Pujut), *kuto-kute* (around Bayan in the north) and *ngeto-ngete* (in two separate areas, around Suralaga and around Sembalun, north-east) (see map, Thoir 1979, 1985).

There has been Balinese influence on the language since the mid-seventeenth century, due to the political dominance of the Balinese, at least in the west (see Teeuw 1954). A considerable Balinese population (approx. 80,000) is found in the area around Mataram-Cakranegara, originating historically from the Karangasem region of Bali. There have also been borrowings from Javanese (some via Balinese). The map in Thoir 1979 shows two towns with Javanese-speaking communities (Praya and Selong). In the east there is influence from Sumbawa, with several Sumbawanese villages there (Teeuw 1951, 1958). Since most of the population are Muslims, there is also influence from Arabic.

A full descriptive account of a Sasak variety is yet to be written. The discussion below is based on data in the literature, and the present wordlist.

Map 25. Sasak language area

## 2. Phonology

### Consonants

	Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	<i>ʔ</i>
	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>	
Fricatives			<i>s</i>		<i>h</i>
Nasals	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals		<i>l</i>			
Vibrants		<i>r</i>			
Glides	<i>w</i>		<i>y</i>		

*ʔ* is in contrast with */k/* finally, for example *roaʔ* 'old', *toak* 'shoulder'. The two phonemes are sometimes in variation cross-dialectally.

## Vowels

According to Teeuw, most varieties of Sasak have 6 vowel phonemes:

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

In a few villages in the south, [ɛ] and [ɔ] are said to be phonemic (Teeuw 1951, 1957), giving an eight-vowel system. Thoir (1985) on the other hand describes the eight-vowel system as standard, but does not illustrate with minimal pairs. Moreover, their phonemes /e/, /ɛ/ and /ə/ are represented by a single grapheme *e* in their wordlist. Slamet Ryadi Ali, the compiler of the present wordlist, uses the six-vowel system above.

### 3. Phonotactic constraints

#### Syllable and root structure

In the native lexis a syllable has the structure (C)(L)V(C) where only V is compulsory, and L (/l/ or /r/) does not occur in monosyllables. Only one vowel can occur per syllable.

The majority (more than 90%) of root morphemes are disyllabic, with preferred structures CVCV(C) and CVNVCV(C). A liquid (L) may occur before one but not both vowels. Disyllabic roots of structure (C)VV(C) are also common. These possibilities can be summed up in the formula:

$$(C_1)(L)V_1(N)(C_2)(L)V_2(C_3)$$

A second possible disyllabic structure is a reduplicated C<sub>1</sub>(L)V<sub>1</sub>C<sub>3</sub> sequence, i.e.:

$$C_1(L)V_1C_3C_1V_1C_3$$

Some phonotactic constraints applying to roots of these structures are discussed in the following sub-sections.

### 3.1 Constraints on consonants

#### Initial, medial and final position

All consonants may occur initially and medially (i.e. in C<sub>1</sub> and C<sub>2</sub> positions), except /h/ and /ʔ/. Initial /w/ and /y/ occur largely in loans, while medially [y] and [w] may optionally break up VV sequences where the first vowel is /i, e/ or /u, o/. Phonemic homorganic vowel-glide sequences do not occur:

*loek* [lowek ~ loek] ‘soft’      *sean* [sean ~ seyan] ‘separate’

In final (C<sub>3</sub>) position the following do not occur: voiced stops, laminal stops (including *n̄*), *w*<sup>1</sup> and *y*.

#### Consonant clusters

The principal medial clusters allowed in simple roots (as opposed to those containing a reduplicated C(L)VC sequence) are NC (a nasal homorganic with a following oral stop, or /ŋ/ if C<sub>2</sub> = /s/) and, more rarely, NCL:

*gompəʔ* ‘group’      *aŋsuh* ‘instalment’  
*kamplaŋ* ‘hit’      *čontlak* ‘jump’

A few roots of form CVLCV(C) are listed in Thoir (1985). These mostly have affective/iconic meanings, or are names of plants and animals (like phonotactically exceptional items in Javanese, see Uhlenbeck 1950):

*talsek* ‘jab’      *terboʔ* ‘baby vomit’  
*terset* ‘kind of insect’      *ǰoltak* ‘jump’

Acceptable intervocalic clusters in roots are thus usually either NC, NCL or LC. However where roots consist of a (meaningless) reduplicated C<sub>1</sub>(L)V<sub>1</sub>C<sub>3</sub> sequence, any consonants acceptable in C<sub>1</sub> and C<sub>3</sub> position can cluster medially:

*laŋlaŋ* ‘village official’      *kiskis* ‘thresh’  
*taʔtaʔ* ‘chop up’      *luhluh* ‘mortar’

1. Thoir (1985) lists one form with final /w/, *geraw* ‘many’.

### A constraint on liquids

Only one of the L slots may be filled in a two syllable root, that is L may occur in either first or second syllable, but not in both. In bases formed from reduplicated CLVC sequences, L occurs only in the first syllable:

*črokčok* ‘kind of bird’      *blukbuk* ‘roast, burn’

### Consonant harmony

Consonant harmony similar to that reported by Adelaar for Malay and reconstructed by him for Proto-Malayo-Polynesian (1983) also occurs in Sasak. That is, in roots of form  $C_1V(N)C_2V(C)$ , where  $C_1$  and  $C_2$  are obstruents or nasals (or, for  $C_2$  only, a glide) sharing the same place of articulation, with few exceptions they must also share the same manner of articulation (in other words, they must be identical).

## 3.2 Constraints on vowels

### Initial, medial and final position

Any vowel can occur initially, though very few /u/-initial roots are listed in Thoir (1985). All vowels occur word-medially, though constraints of vowel-height harmony (below) restrict occurrence in some ways. In some dialects (including that of the comparative wordlist), /a/ does not occur word-finally, due to the historical change /a/ > [ə] finally. All word-final /ə/ derive from this change. In those dialects where the change has not occurred (e.g. those in the northwest), /ə/ does not occur in final position.

### Height harmony

There is a strong tendency for harmony in the height of front and back vowels, such that  $V_1$  and  $V_2$  agree in height, regardless of whether consonants intervene medially. Compare Dutch *pistool* ‘pistol’, Sasak *pestol*; Malay *tumit* ‘ankle’, Sasak *tomet*. Exceptions generally involve a high  $V_1$  followed by a mid  $V_2$ : *tio?* ‘grow’; *puro* ‘chase away’.

## 4. Stress

“Stress can almost always be predicted as falling on the the last syllable” (Thoir 1979: 6). How affixation influences this is not indicated.

## 5. Morphology

Sasak is an agglutinating language. There are significant variations from dialect to dialect in verbal and nominal morphology (Thoir 1979, 1985). Bound morphemes occurring in the wordlist, with summary descriptions of their function, include the following derivational affixes.

### Verb affixes:

*hə(r)-*: marks intransitive verbs, typically expressing states, or durative actions.

*bər-ambu* ‘smell (vb.intrans)’ *bə-tian* ‘be pregnant’ (*tian* ‘stomach’).

*bə(r)-* in combination with *-an* indicates reciprocity of the action:

*bə-kapoŋ-an* ‘embrace’ *bə-jaŋur-an* ‘fight’

*kə(r)-*: indicates involuntary action:

*kə-səku?* ‘hiccough (vb.intrans)’

*N-* : (for realisations see Section 6 below). Marks “active” or “actor pivot” (see Foley – Van Valin 1984) transitive verbs, and a subclass of “dynamic” intransitive verbs:<sup>1</sup>

*ñeda?* (*N-seda?*) ‘crush’ *ŋə-ləle?* (*N-ləle?*) ‘laugh’

*pə(r)-*: derives causative transitive verbs:

*pər-eŋət* ‘remind’ (*eŋət* ‘remember’), *pər-anak-aŋ* ‘give birth to’ (*anak*, ‘child’)

*tə* : marks passive voice (Thoir 1979: 35):

*tə-(pər-)anak-aŋ* ‘be born’ *tə-tolo?* ‘put down, placed’

*-in* : marks transitive verbs, typically further specifying the semantic role of the undergoer NP as LOC (location, goal, recipient):

*taek-in* ‘climb (vb.trans)’ *endeŋ-in* ‘ask (someone)’

*-aŋ* : marks transitive verbs, typically further specifying the semantic role of the undergoer NP as “circumstantial” (benefactee, causee, thing transferred):

*taek-aŋ* ‘raise’ *endeŋ-aŋ* ‘ask (for someone)’

Where the root is already transitive (e.g. verbs of perception), *-aŋ* can signify deliberate effort on the part of the actor/agent:

*-dəŋah* ‘hear’ *dəŋah-aŋ* ‘listen to’

1. Thoir (1985: xx) indicates that in the *ngeto-ngete* dialect, a homophonous morpheme with different morphophonemic behavior, marks “passive voice”.

- ʔ : occurs sporadically on vowel-final bases only. It has the same causative function as *pə(r)-*, e.g.:
- tali-ʔ* ‘tie up’ (*tali* ‘rope’) *təmoe-ʔ* ‘receive (a guest)’ (*təmoe* ‘guest’)

### Nominal affixes

*pə-* : nominaliser, forming nouns with various meanings determined by the nature of the stem, including:

1. Where the stem is an “undergoer pivot/passive” verb form, or an intransitive:

a) ‘object or person undergoing (verb)’:

<i>pə-sajǐ-ʔ</i> ‘thing served’	<i>pə-r-beŋ</i> ‘gift’
( <i>sajǐ-ʔ</i> ‘serve’)	( <i>bər-beŋ</i> ‘give’) <sup>1</sup>

2. Where the stem is a verb carrying prefix *N-* :

a) ‘object or person carrying out (verb)’:

<i>pəñesek</i> ‘loom’	<i>pə-ŋ-arət</i> ‘herder’
( <i>N-sesek</i> ‘weave (vb.intrans)’)	( <i>N-arət</i> ‘herd’)

*-an* : nominaliser, where the stem is a transitive or intransitive verb, meanings include “thing which undergoes (verb)”:

<i>inəm-an</i> ‘drink’	<i>kakən-an</i> ‘food’
( <i>inəm</i> ‘drink’ (vb.trans))	( <i>kakən</i> ‘eat’)

*-n* : links two nominals in a “genitive” or “associative” relationship to form a compound e.g. *bale-n lani* ‘house-*n* bee’, i.e. ‘hive’. *-n* only occurs on vowel-final heads – phonotactic constraints rule out /Cn/ clusters. Compounds where the head nominal ends in a consonant simply conjoin the two elements e.g. *anak bembeʔ* ‘child-goat’ i.e. ‘kid’. Some compounds with vowel-final heads do not have *-n*, e.g. *madu lani* ‘beeswax’.

## 6. Morphophonemic alternations

There are significant variations from dialect to dialect in verbal and nominal morphophonemics (Thoir 1979, 1985). Only information relevant to the wordlist is given here. The discussion is based on data from the comparative wordlist, and, where indicated, Thoir (1979, 1985).

1. On morphophonemics see section 6.

1. *N-*: The verbal prefix indicated in Section 5 as *N-* (including the same element in verbal stems to which the nominalising prefix *pə-* is attached) has the following realisations:

as /ŋ/ before vowels:

*ŋ-impi* ‘dream’                      *ŋ-usap* ‘sweep’;

as the homorganic nasal, with nasal accretion, before stems of more than one syllable beginning with a voiced obstruent:

*m-bača* ‘read (vb.trans)’      *n-dəŋah* ‘hear’  
*ñ-ǰau?* ‘bring’                      *ŋ-giliŋ* ‘grind’;

as the homorganic nasal, with nasal substitution, before stems of more than one syllable beginning with voiceless obstruents:

labials:      *mŋgo?* (*N-pŋgo?*) ‘carry on shoulder’  
 apicals:      *nai* (*N-tai*) ‘defecate’  
 laminals:      *ñobə* (*N-čobə*) ‘try’  
                     *ñeda?* (*N-seda?*) ‘crush’  
 dorsals:      *ŋubur-aŋ* (*N-kubur-aŋ*) ‘bury’;

as /ŋə/ before:

1. sonorant consonants:

*ŋə-maliŋ* ‘steal’                      *ŋə-lələ?* ‘laugh’;  
*ŋə-rəba?* ‘cut down’                      *ŋə-wartə-aŋ* ‘announce’

2. monosyllabic stems:

*ŋə-čop* ‘give up’                      *ŋə-beŋ* ‘give’

3. some stems of more than one syllable beginning with /b/:<sup>1</sup>

*ŋə-bələ?* ‘break’                      *ŋə-bəta?* ‘flay’.

2. *bə(r)-*, *kə(r)-*, *pə(r)-*: these have the realisation *bər-*, *kər-*, *pər-* before stems beginning with vowels.<sup>2</sup> Elsewhere, they occur as *bə-*, *kə-*, *pə-* (Thoir 1985: xxiii, xxiv). Note that *tə-* is invariant.

*bər-aǰah* ‘learn’                      *bə-tian* ‘be pregnant’ (*tian* ‘stomach’),  
*kə-səku?* ‘hiccough’                      *kər-anti?* ‘taken accidentally’ (*anti?* ‘take’)  
*pə-bələ?* ‘enlarge’                      *pər-anak-aŋ* ‘give birth to’

1. This is not attested in Thoir (1979, 1985). The compiler, Slamet Ryadi Ali, says it is due to influence of the dialect to the east of Praya.

2. Thoir (1979, 1985) indicate that *bər-*, *kər-*, *pər-* occur before stems beginning with nasals, e.g. *bər-mbeŋ* ‘give’: we analyse such stems as beginning with ə, e.g. *bər-əmbəŋ*. There are no cases of *bər-*, *kər-*, *pər-* occurring before unambiguously nasal-initial stems in Thoir 1985.

3. *bər-* is reduced when occurring as part of the stem of a derived nominal (with the nominaliser *pə-* above):

*pə-r-beŋ* ‘gift’, *bər-beŋ* ‘give’

## 7. Orthography

There are two writing systems, the traditional *aksara*, borrowed from Java and deriving ultimately from southern India, and Roman script, more commonly used now.

The Roman script is largely phonemic except that:

- grapheme *e* represents both /ə/ and /e/;
- *n* also represents /ñ/ before /č/ and /j/;
- final /ə/ is represented as grapheme *a*;
- the digraph *ng* represents /ŋ/; *ny* represents /ñ/ before vowels;
- /ʎ/ is represented by *q*.

## 8. About the wordlist

The comparative wordlist was compiled by Slamet Ryadi Ali, originally from Praya, central Lombok, and is thus based on the variety of that town. Annotations are by Clynes, based mainly on the following dictionaries: *Kamus Sasak-Indonesia* (Thoir 1985), Goris (1938), as well as relevant data from Teeuw (1951, 1958).

Transitive verbs are cited in the “actor pivot” or “active” form (that is, prefixed by the appropriate realisation of the morpheme *N-* (see 2.4.1, 2.5)), since this form best translates the headword. The bare stem (which is the form of the “undergoer pivot/passive” form and also of the imperative) is given in brackets only where it is not immediately recoverable from the morpheme breaks indicated. Some intransitive verbs also carry *N-*, however the stem in this case is always bound.

Morpheme breaks are indicated, except where their synchronic status is questionable. Thus *ambah-in* ‘take a path’, from *ambah* ‘path’, but *mənek* ‘go up’ derives synchronically from *N-pənek*, not \**N-pə-nek*, despite cognates such as *naik* (Malay).

## 26. Gorontalo

---

---

<b>Contributors:</b>
Introduction: <i>A. John Little, Jr.</i>
Wordlist: <i>Hamzah Machmoed, Asma Djafar Mustafa, A. John Little, Jr.</i>

---

---

### 1. Introduction

Gorontalo is a Philippine-type language, spoken by more than 900,000 speakers living mainly in the western half of the Sulawesi Utara (North Sulawesi) province, Indonesia. As well, sizable communities are found in the cities of Manado (eastern tip of the North Sulawesi peninsula), and in Jakarta, the capital of Indonesia. The principal traditional occupations of the Gorontalo are farming (rice, copra, corn), timber getting, resin gathering, fishing and hunting. Nearly all are Muslims, Islam having been propagated in the Gorontalo region from the mid-sixteenth century.

Musa Kasim (1981) distinguishes five main dialects: east Gorontalo; Gorontalo town (in the southeast corner of the Gorontalo area); Limbotto, also in the east; west Gorontalo, and Tilamuta, in the centre. The dialect of the wordlist is principally that of the town of Gorontalo. Other languages spoken in the area include Suwawa, Atinggola, Kaidipang, Bolaang-Mongondouw, Bajo, Tontemboan and Sangir. Gorontalo, Suwawa and Atilongga are said to be mutually intelligible (Machmoed 1973).

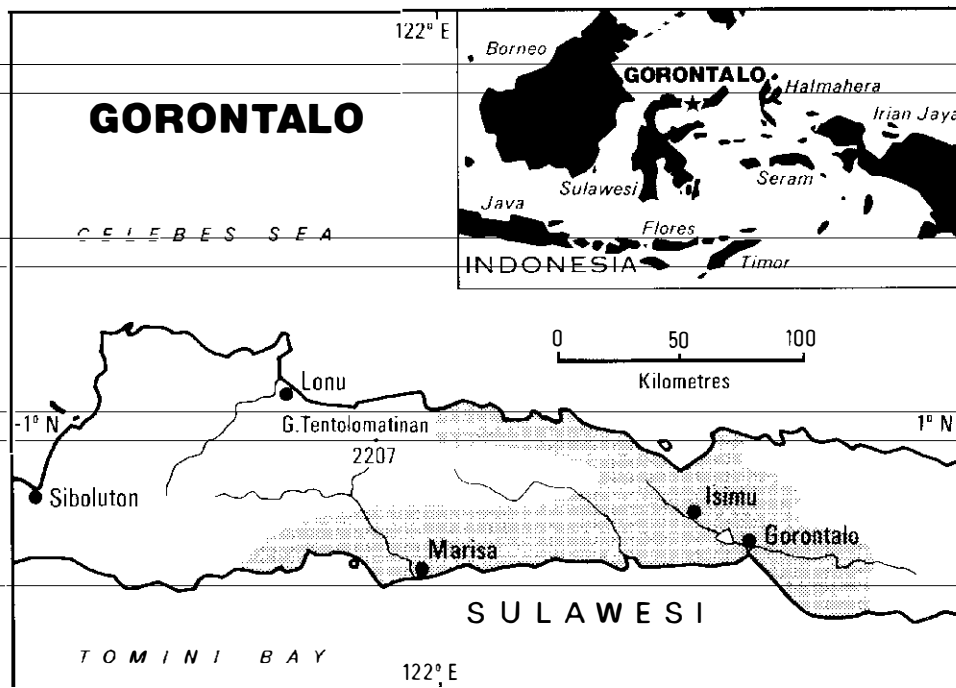

The several small kingdoms of the Gorontalo region were vassal states of the Sultan of (Galela-speaking) Ternate from about 1570 to 1677 (Kern 1938), with the Portuguese in turn controlling Ternate from 1532 till 1663 (Atlas van tropisch Nederland, Blad 10). In 1677 the Gorontalo area was ceded to the Dutch East Indies company (Klerck, 1938: 310). In 1889 the Dutch colonial government took control.

Many Gorontalo also speak Manado Malay and Indonesian. These, with Arabic, Portuguese, Dutch and Galela (a non-Austronesian language), are the principal sources of loanwords. Examples of borrowings from Galela include *?abila* 'basket', *?oloŋiya* 'king', *jogugu/huhuhu* 'state administrator'.

Map 26. Gorontalo language area

## 2. Phonology

Table 1. Consonants

		Labial	Apical	Dorsal	Glottal
Oral stops	vl	<i>p</i>	<i>t</i>	<i>k</i>	?
	vd	<i>b</i>	<i>d</i>		
Prenasalised		<i><sup>m</sup>b</i>	<i><sup>n</sup>d</i>	<i><sup>ŋ</sup>g</i>	
Fricatives					<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels		<i>w</i>	<i>y</i>		

*t* is apico-dental, *d*, *<sup>n</sup>d* and *l* are apico-alveolar. Pateda (1977) and Badudu (1982) write *<sup>n</sup>d* as *<sup>n</sup>t* and *<sup>n</sup>ṭ* respectively.

Stops are unaspirated. Voiced stops *b* and *d* are simultaneously glottalised in stressed syllables, and in the first syllable of trisyllabic words.

Allophones of phonemes and minimal pairs are presented and exemplified in Machmoed (1973), Badudu (1982).

The consonants  $\tilde{n}$ ,  $\check{c}$ ,  $\check{j}$ ,  $\tilde{n}\check{j}$ ,  $g$ ,  $r$ ,  $f$  and  $s$  occur only in loanwords.  $k$  occurs mainly in loanwords, but may occur in a small number of inherited items (Badudu 1982).

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

VV sequences occur, including sequences of identical vowels: *taa* 'personal nominaliser', *mo-diilo* 'kiss'. Only one vowel occurs per syllable (see syllable structure).

### Stress

Stress is not phonemic, falling predictably on the penultimate syllable of phonological words (including enclitics). Thus *momikiira'raŋi* 'think', *momikiira'ŋi-po* 'think before (doing something)'.<sup>1</sup>

### Syllable structure

Syllables may have the structure CV or V.<sup>1</sup> Syllables are thus always open, with all morphemes and words ending in vowels, at least in (careful speech) surface phonetic forms. The most common structure of monomorphemic lexical roots is CVCVCV. Other morpheme structures occur, such as CV, V (mainly grammatical morphemes), and sequences such as CVV, CVCV, CVCVV, CVVCV, CVVCVCV, CVCVVVCV and longer, in (mainly) lexical morphemes. Roots given as vowel-initial in Pateda (1977) are here and in Musa Kasim (1981) analysed as beginning with /?/.

1. Surface CC sequences are created by reduplication of the first syllable of roots, where they are preceded by another prefix (see below). These are rapid speech alternants of CV reduplications, the vowel being optionally deletable.

### 3. Morphology

Here we list only the bound morphemes found in the comparative wordlist. This by no means covers all the bound morphology of Gorontalo; for further information see Badudu (1982), Pateda (1977), Musa Kasim (1981) and Little (in progress).

#### Verb morphology

<i>mo-</i>	forms both transitive and intransitive verbs (including verbs with adjectival senses) <i>mo-bale</i> ‘turn around (vi)’, <i>mo-hutu</i> ‘do, make’, <i>mo-putiʔo</i> ‘white’.
<i>moN-</i>	forms ‘actor focus’ transitive and intransitive verbs, e.g. <i>momilohu</i> ( <i>moN-bilohu</i> ) ‘look, look at’. For realisations see section 5.
<i>moh-</i>	‘actor focus prefix’. <sup>1</sup>
<i>mo-po-</i>	‘causative prefix’, compare <i>mo-laʔito</i> ‘burn (vi)’, <i>mo-po-laʔito</i> ‘light, burn (vt)’, <i>momilohu</i> ( <i>moN-bilohu</i> ) ‘look, look at’, <i>mo-po-bilohu</i> ‘show’.
<i>mo-poʔo-</i>	also forms causatives: <i>lapato</i> ‘finished’ <i>mo-poʔo- lapato</i> ‘finish (vt)’
<i>mo-ʔo-</i>	‘active, abilitative’ <i>mo-luli</i> ‘healed (vi)’, <i>mo-ʔo-luli</i> ‘cure (vt)’, <i>sababu</i> ‘cause (n)’, <i>mo-ʔo-sababu</i> ‘cause (vt)’.
<i>mo-hi-</i>	attaches to nouns, forming verbs with an instrumental sense ‘use, wear [noun]’. Only used of items of clothing (Badudu 1982).
<i>ti-</i>	‘reflexive affix’. Occurs in combination with <i>mo-</i> to form intransitive verbs.
<i>mee-</i>	(~ <i>mei-</i> , <i>mai-</i> ) marks accidental and other non-volitional actions, or actions where the actor is not stated.
<i>ʔo-</i>	forms intransitive verbs from noun roots: ‘have [noun]’: <i>ʔo-hiyalo</i> ‘have-spouse, be married’.
<i>-um-</i>	often forms intransitive, stative verbs. Only occurs on roots with initial segments /t d l h ʔ/ (Badudu 1982: 74).
<i>olo</i>	attached to the bare verb stem marks object focus. Does not co-occur with “active” forms.

1. This is not listed by Badudu (1982), Pateda (1977).

- alo* attached to the verb stem, marks direction focus. Does not co-occur with “active” forms.<sup>1</sup>
- a* marks both transitive and intransitive verbs of more than three syllables with an object, adjunct or adverbial: *momintaʔo* ‘lift (vi)’, *momintaʔaa* ‘lift (vt)’; *motihuloʔo* ‘sit (vi)’, *motihuloʔaa to kadera* ‘sit in a chair’, *motihuloʔaa ooʔoolaana* ‘sit all day long’ (Badudu 1982, see also section 5).
- mayi, maʔo* Certain verbs occur with locative particles, *mayi* ‘to here’ *maʔo* ‘to there’. These in some cases obligatorily cliticise to the verb stem as *-ayi, -aʔo*.

### Noun morphology

- poN-* forms instrumental nouns *-bite* ‘row (v)’ *pomite* ‘paddle’, *putu* ‘cut’ *pomutu* ‘knife’.
- po-* plus reduplication of the initial syllable of the root, forms manner nouns: *po-bo-botoʔo* ‘way (someone) faints’.
- ŋo-* ‘one’, forms nominals: *ŋo-olo* ‘one portion, some’.
- ʔu-* nominaliser *ʔu-du-laʔa* ‘parents’, from *daʔa* ‘big’.
- a1* derives nominals, either in combination with *po-* (*wutato* ‘sibling’ *po-ʔu-wutata-a* ‘cousin’), and/or with partial reduplication of the stem (below).
- a2* “ligature” forms complex NPs, e.g. *maluʔaa bange* ‘rooster’, from *maluʔo* ‘fowl’, *-a, bange* ‘male (of birds)’.
- RED** There are several types of reduplication, sometimes derivational, sometimes (on verbs) marking aspect. **RED** may affect only the first syllable of a stem: *-biyahu* ‘look after’, *bi-biyahu* ‘livestock’, *i-iilo* ‘grater’, *-iilo* ‘grate’; this may be in combination with other bound morphemes: *mo-lihu* ‘bathe’, *mo-li-lihu* ‘habitually bathe’, *po-li-lihu-a* ‘bathing place’; *-hiliŋo* ‘mill (v)’, *hi-hiliŋ-a* ‘mill (n)’. **RED** may also be of the first two syllables of the stem: *pawu-pawusi* ‘whale’ (from Dutch [paus]), *-tumulo* ‘life, alive’, *tumu-tumulo* ‘living (durative)’, *-huumo* ‘close’, *huu-huumo* ‘closed (durative)’.
- il-* forms deverbal nouns *m-il-ate* ‘corpse’, *mate* ‘dead’; *ʔa-alo* ‘eat’, *ʔ-il-a* ‘rice’. As an inflectional affix *-il-* marks perfective aspect.

1. Note that Badudu and Pateda collapse *-olo* and *-alo* in a single affix, *-lo*.

## 5. Morphophonemics

The rules of morphophonemic alternation in Gorontalo are complex. Here only the types of contraction and assimilation occurring in forms in the wordlist are illustrated. These processes often apply differentially according to the type of affix, or the class of the root morpheme concerned: there are two classes of root morphemes, differing as to whether they undergo loss of final vowel when in conjunction with certain affixes and enclitics. For further discussion, see Badudu (1982), Machmoed (1973) and Little (in progress).

– *N-* in *moN-*, *poN-* is realised as:

<i>ŋ</i>	before stems beginning with <i>ʔ</i> , <i>w</i> or <i>y</i>
<i>m</i>	before labial stops and <i>h</i> <sup>1</sup>
<i>l</i>	before apical stops

examples:

<i>moN+wuʔadu</i>	>	/moŋuʔadu/ ‘untie’
<i>moN+puduʔo</i>	>	/momuduʔo/ ‘carry under arm’
<i>moN+tali</i>	>	/molali/ ‘carry’

– root-final *o* is assimilated to the ligature *a*:

<i>maluʔo + a + ba<sup>u</sup>ge</i>	>	/maluʔaa ba <sup>u</sup> ge/ (see wordlist 03.520)
--------------------------------------	---	--

similar processes across morpheme boundaries occur in:

<i>wulato+alo</i>	>	/wulatalo/
<i>ŋo+walaʔo+a</i>	>	/ŋa-alaʔ-a/

– root final *u* plus the (initial) *a* of an affix or clitic is realised as the sequence *ee*:

<i>lindudu + a</i>	>	/lindidee/ 11.790, 18.160 ‘good’
--------------------	---	----------------------------------

– stem-initial *w* and *y* are lost following an *o*-final prefix or enclitic:

<i>mo+woti</i>	>	/mo-oti/ ‘calm (of sea)’
<i>mo+yimbidu</i>	>	/meembidu/ ‘near’ (with subsequent lowering and assimilation)

and following *poh-* and *moh-*:

<i>moh+yilapito</i>	>	/mohilapito/ ‘pursue’
<i>moh+walamo</i>	>	/mohalamo/ ‘weave’

1. There are very few examples of *moN-* before *h*-initial stems, or *w* and *y*. An analysis not followed here is to group *moh-/poh-* as lexically determined allomorphs of *moN-*.

– the stem initial sequence *wa* goes to *e* after *poh-* or *woh-* :

*moh+ wajobu* > /mohejobu/ ‘have sexual intercourse (animals)’

*moh+ wudedu* > /mohededu/ ‘rub, wipe’.

---

---

### 1. Introduction

Da'a is one of several speech varieties of the Kaili dialect cluster spoken in western Central Sulawesi. There are approximately 32,000 Da'a speakers living predominantly in the mountains. There are variations within the Da'a speaking area. Except where noted otherwise, the word list and introduction refer to the Dombu variety of Da'a.<sup>1</sup>

Much of Da'a life revolves around shifting agriculture in which sweet potatoes, taro, cassava, and corn are grown. In a few areas dry-field rice is cultivated. Some sago is eaten in western lowland villages. Cash crops are coffee, cloves, and fruit.

Although local political structure currently conforms to the Indonesian government system for village hierarchy, the more traditional *madika* leader continues to arbitrate disputes and perform ceremonies that fall outside the modern system. Islam, Christianity, and traditional beliefs are all adhered to in the Da'a area.

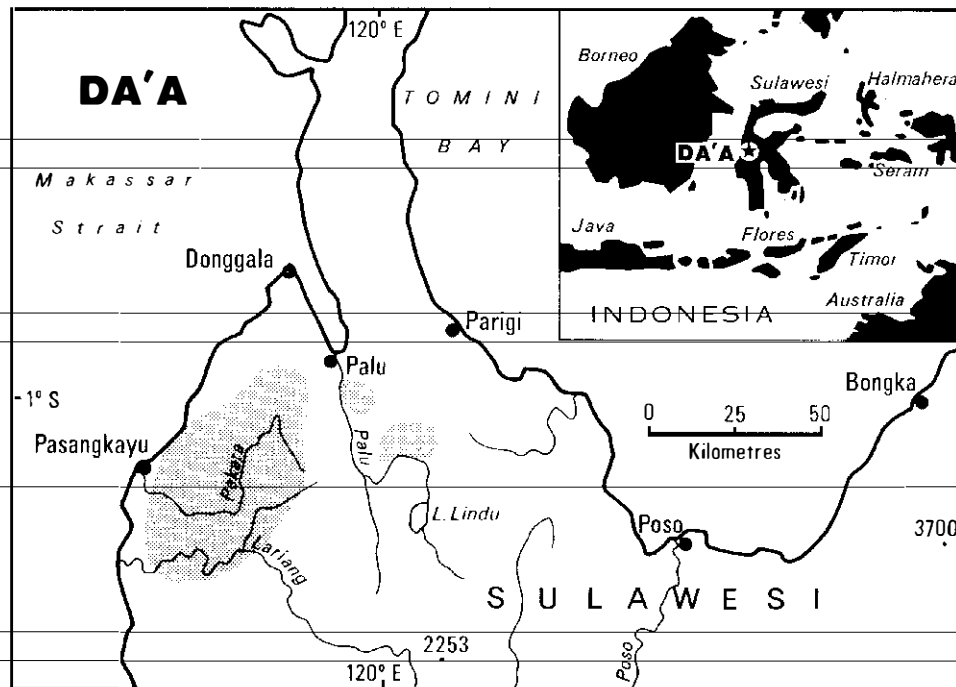

Da'a is classified with the Kaili-Pamona languages within the Central Sulawesi Group (cf. Barr – Barr – Salombe 1979).<sup>2</sup> The Kaili languages were formerly known in the Dutch literature (e.g. Adriani – Kruyt 1912-1914, A.C. Kruyt 1938) under the term "West Toraja", a term that is currently unacceptable to the people of the region.

Da'a phonology is described in D. Barr – S. Barr (1988); realis-irrealis distinctions in D. Barr (1983); verbal affixes and clitics in D. Barr (1988a); functions of reduplication in D. Barr (1988b); the mechanisms for signalling

- 
1. The author has been studying the Da'a language since 1979 and has been resident in the language area for much of that time. The study is part of a larger programme of cooperation between Hasanuddin University (Ujung Pandang) and the Summer Institute of Linguistics.
  2. [The Central Sulawesi languages may group at a higher level with the South Sulawesi languages and with the languages of south-east Sulawesi to form a "Nuclear Sulawesi" group within WMP, excluding the Gorontaloic, Minahasan, and Sangiric languages. -Eds.]
-

focus and mood in Da'a discourse are discussed in D. Barr (1988c); kinship and marriage are described in S. Barr (1988).

Map 27. Da'a language area

## 2. Summary of Da'a phonology

### 2.1 Inventory of consonants

Table 1. Da'a consonants

	Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl vd	p b	t d	j	k g
Prenasalised stops	vl vd	<sup>m</sup> p <sup>m</sup> b	<sup>n</sup> t <sup>n</sup> d	<sup>n</sup> j	<sup>ŋ</sup> g
Fricatives		v	s		
Nasals		m	n	ŋ	
Laterals			l		
Trills			r		
Semivowels				y	

The /v/ is phonetically a voiced labio-dental fricative. There are no consonant clusters in Da'a as syllable types are restricted to CV and V. Thus, prenasalised stops are considered unit phonemes rather than sequences of two phonemes. The /ʃ/ is an affricate. The phonemes /č/ and /ñč/ that occur in closely related Kaili languages do not occur in Da'a except in a few loans. For the most part, /č/ in other languages has merged with /s/ in Da'a. The apical trill /r/ surfaces in some subdialects of Da'a as a flap or as a voiced velar fricative [ɣ]. The glottal is optionally present before vowel-initial roots. The glottal is in contrast with zero intervocally.

- |     |             |                             |
|-----|-------------|-----------------------------|
| (1) | <i>neʔe</i> | 'don't'                     |
|     | <i>tee</i>  | 'tea'                       |
| (2) | <i>kuʔu</i> | 'stiff with dirt'           |
|     | <i>kuu</i>  | 'small black biting insect' |

## 2.2 Inventory of vowels

Table 2. Da'a vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

In Da'a each vowel forms a syllable nucleus. Thus, vowel sequences, which may be either like or unlike vowels, constitute two syllables. Vowel sequences occur in all combinations.

The semivowel /y/ does not occur before front vowels /i e/, except in a few loans.

## 2.3 Word stress

Word stress in Da'a falls on the penultimate syllable of the root. Thus, with vowel sequences, stress falls on the penultimate vowel, regardless of whether or not the sequence is geminate.

(3)	['tara]	'look at'
	[ta'raa]	'pineapple'
	['mata]	'eye'
	['pue]	'lord, master'
	['kuu]	'small black biting insect'
	['uma]	'father'
	['peo]	'down below'
	[ma <sup>n</sup> diu]	'will bathe'

Primary word stress shifts to the right with the addition of suffixes (e.g. *-(C)aka*) to fall on the newly formed penultimate syllable. With the addition of enclitics, however, word stress remains on the penultimate syllable of the root and does not shift to the right.

(4)	['nawu]	'fall'
	[ra-nawu-'saka]	'it (will) drop (to me)'
(5)	['sapo]	'house'
	['sapo-ku]	'my house'
(6)	['vavu]	'pig'
	['vavu-na]	'his/her pig'
(7)	[na'ria]	'have'
	[na'ria-mo]	'already have'

### 3. Morphology

Much of Da'a verbal morphology revolves around mood distinctions of *realis* (real, fact, fully actualised, past, completed action, state already existing) marked with *n-*, and *irrealis* (contemplated, anticipated, future, not yet complete, unreal, not fact) marked with *m-*. Furthermore, like many of the Philippine languages, Da'a uses separate, but interlocking strategies for encoding the semantic role structure on the one hand, and pragmatic prominence or *focus*, on the other. For Da'a this requires mechanisms for Actor Focus, and Goal Focus with its associated encoding for Non-focused Actor. The third major parameter of Da'a morphology revolves around *aspect*.

Pronominal deixis is marked by the following forms:

Table 3. Da'a personal pronouns

	Focused Free pronouns	Non-focused Actor proclitics	Actor enclitics/ genitive enclitics
1sg	<i>aku</i>		<i>-ku</i>
2sg	<i>iko</i>	<i>mu-</i>	<i>-mu</i>
3sg	<i>i'a</i>	---	<i>-na</i>
1pl excl	<i>kami</i>	---	<i>(kami)</i> <sup>1</sup>
1pl incl	<i>kita</i>	---	<i>-ta</i>
2pl	<i>komi</i>	---	<i>-mu</i> <sup>2</sup>
3pl	<i>ira</i>	---	<i>(ira)</i> <sup>3</sup>

Where the syntactic subject of a transitive verb is in pragmatic focus, the focused free pronouns are used to indicate the Actor (Actor Focus). Where the grammatical Object is in pragmatic focus and where indexing the Actor is also required, the non-focused Actor enclitics are used (Goal Focus). The non-focused Actor proclitics are used only occasionally in very informal intimate conversation. Focus and mood affixes in Da'a are as follows:

Table 4. Da'a focus and mood affixes

	Actor focus	Goal focus
Declarative	<i>na(N)</i> <sup>4</sup>	
Realis	<i>ne(N)-</i> <i>no(N)-</i>	<i>ni-</i>
Declarative	<i>ma(N)-</i>	
Irrealis	<i>me(N)-</i> <i>mo(N)-</i>	<i>ra-</i>
Imperative	<i>pa(N)-</i> <i>pe(N)-</i> <i>po(N)-</i> $\emptyset$ (STEM alone)	<i>rapo-</i> + ROOT/STEM

1. Only the free pronoun is used.
2. Some Da'a areas use *-mi*.
3. The same areas which use *-mi* '2pl' use *-ra* '3pl'. The Dombu area uses the free pronoun.
4. The different vowels /a e o/ occur with separate verb classes and do not differentiate meaning. The morphophonemic nasal assimilates to the homorganic point of articulation

Additional prefixes are listed below.

(8)	<i>nati-/mati-</i>	non-volitional
	<i>notiN-/motiN-</i>	reflexive
	<i>neti-/meti-</i>	pretence
	<i>nipo-/rapo-/rapo<sup>m</sup>ba-</i>	purpose
	<i>si-</i>	reciprocal and multiple actors
	<i>ki-</i>	requestive
	<i>ka-</i>	affected by the action of root
	<i>pa-/po-</i>	causative
	<i>pa-/pe-/po-</i>	valence increaser, transitiviser

There is further a derivational suffix *-(C)aka* where the (C) is an epenthetic apical /t s n r/ appearing with some roots. The function of the suffix is to repackage the semantic role structure of the root, often with a causative sense.

(9)	<i>nawu</i>	'fall'
	<i>nawu-saka</i>	'drop (cause to fall)'
(10)	<i>sua</i>	'enter'
	<i>sua-raka</i>	'insert (cause to enter)'
(11)	<i>ga?a</i>	'separate'
	<i>ga?a-naka</i>	'divorce (cause to be separated)'
(12)	<i>goli</i>	'turn'
	<i>goli-aka</i>	'turn over'

There are also phrase and clause-level clitics that do not affect stress.

(13)	<i>da</i>	durative (proclitic)
	<i>-pa</i>	continuing/extending stem
	<i>-mo</i>	perfective <sup>1</sup>

### 3.1 Reduplication in Da'a

In Da'a, reduplication may be of just the root, or of the entire stem.

of the following stop, resulting in prenasalised stops. With /k/-initial roots the resulting stop is voiced /<sup>h</sup>g/.

1. Used with realis, *-mo* has the sense of the perfective 'already'; with irrealis it indicates the action is imminent, about to happen; and with the imperative it softens the command making it less harsh.

- |      |                          |                            |
|------|--------------------------|----------------------------|
| (14) | <i>eo-eo</i>             | ‘every day’                |
|      | <i>tuḵa-tuḵa</i>         | ‘plants’                   |
|      | <i>mo-tesa-tesa</i>      | ‘talk on and on’           |
|      | <i>naka-kata-kata</i>    | ‘be very itchy’            |
| (15) | <i>sa-ᵛgani-sa-ᵛgani</i> | ‘once in a while’          |
|      | <i>sa-ᵐpuʔu-sa-ᵐpuʔu</i> | ‘one plant here and there’ |

The functions of reduplication are many, often expressing plurality of action, direction, or result. Reduplication may signal a diffuse or distributive effect relating to multiple undergoers.

- |      |   |                                |
|------|---|--------------------------------|
| (16) | <i>no<sup>m</sup>ba-bi<sup>ᵛ</sup>ga-bi<sup>ᵛ</sup>ga</i> | ‘broke s.th. into many pieces’ |
|      | <i>nom-bagi-bagi</i>                                      | ‘divide s.th. up’              |
| (17) | <i>ḵuʔa-ḵuʔa</i>  | ‘sicknesses (various kinds)’   |

Reduplication also has aspectual functions indicating repeated/iterative aspect, or continuous aspect.

- |      |   |                        |
|------|---|------------------------|
| (18) | <i>ni-kita-kita</i>                           | ‘he looked and looked’ |
|      | <i>neka-wa<sup>n</sup>tu-wa<sup>n</sup>tu</i> | ‘he kept jumping’      |
|      | <i>nipo-pea-pea</i>                           | ‘he waited on and on’  |

Reduplication of motion verbs can indicate a randomness of direction, or with question words indicate indefiniteness.

- |      |   |                                       |
|------|---|---------------------------------------|
| (19) | <i>ne-<sup>m</sup>bua-<sup>m</sup>bua</i>   | ‘fly around (hither and thither)’     |
|      | <i>ma-<sup>ḵ</sup>ḵayo-<sup>ḵ</sup>ḵayo</i> | ‘going for a walk (no specific goal)’ |
| (20) | <i>u<sup>m</sup>ba-u<sup>m</sup>ba</i>      | ‘wherever’                            |
|      | <i>sema-sema</i>                            | ‘whoever’                             |

Certain adverbs and stative verbs are intensified by reduplication.

- |      |   |              |
|------|---|--------------|
| (21) | <i>ᵐpuʔu</i>                                | ‘very’       |
|      | <i>ᵐpuʔu-ᵐpuʔu</i>                          | ‘extremely’  |
| (22) | <i>naka-kata-kata</i>                       | ‘very itchy’ |
|      | <i>na-da<sup>m</sup>ba-da<sup>m</sup>ba</i> | ‘very happy’ |

## 4. Notes on orthography

Table 5. Orthography conventions for Da'a

Practical orthography	Wumbu 1975	CAD
<i>mp</i>	<i>mp</i>	<i><sup>m</sup>p</i>
<i>m̄b</i>	<i>m̄b</i>	<i><sup>m̄</sup>b</i>
<i>nt</i>	<i>nt</i>	<i><sup>n</sup>t</i>
<i>nd</i>	<i>nd</i>	<i><sup>n</sup>d</i>
<i>nj</i>	<i>nj</i>	<i><sup>n̄</sup>j</i>
<i>n̄ḡḡ</i>	<i>n̄ḡḡ</i>	<i><sup>n̄</sup>ḡ</i>
<i>ng</i>	<i>ng</i>	<i>ŋ</i>

## 28. Uma

---

---

<b>Contributors:</b>
Introduction: <i>Michael Martens</i>
Wordlist: <i>Michael Martens – Herman Rigo</i>

---

### 1. Introduction

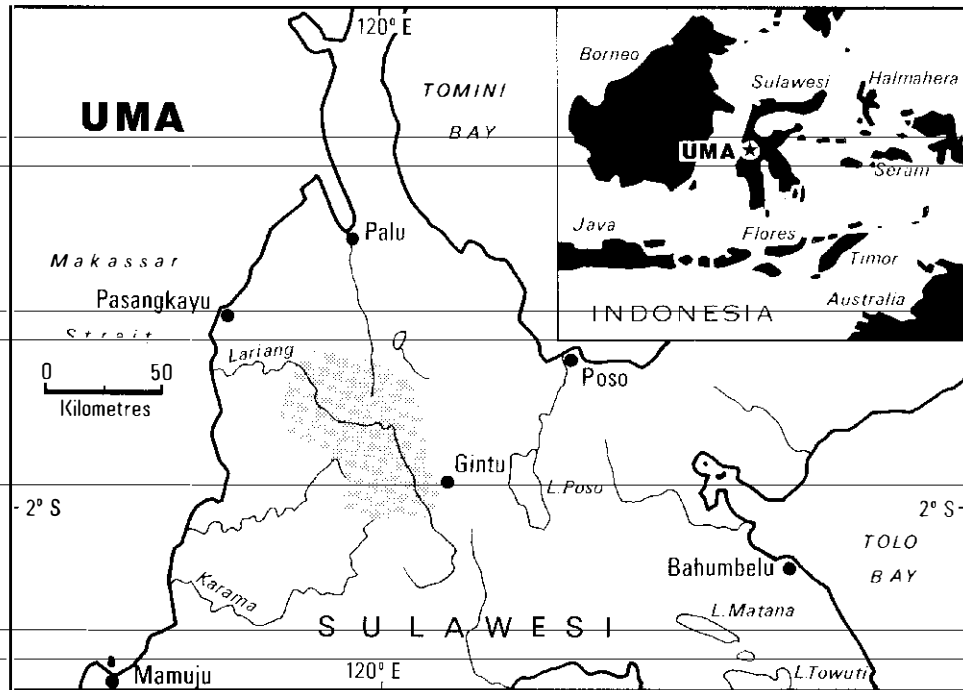

---

Uma (Pipikoro) is spoken by about 20,000 people in the mountains of western Central Sulawesi near the Lariang river. It is classified as one of the Kaili-Pamona languages in the Central Sulawesi subgroup (see Barr – Barr – Salombe 1979). The Kaili-Pamona languages were formerly known in the Dutch literature as “West Toraja” (see Adriani and Kruyt 1912-1914), a term currently unacceptable to the people of the region. The CAD word list is from the village of *Kantewu* representing the central dialect of Uma.<sup>1</sup> Other dialects of Uma are the northern dialect, *Winatu*, spoken in the Winatu, Lonca’ and Gimpu/Tori’untu areas; the western dialect, *Tobaku*, spoken in Towulu’, Siwongi, and several smaller villages; and the southern dialect, *Aria*, spoken in Peana, Banasu, and other smaller villages. All of these dialects are very closely related with percentages of lexical similarity ranging in the mid-to-high 90s. Intelligibility between dialects is not a problem. Any significant dialect variants will be noted in the footnotes to the word list.<sup>2</sup>

The best known study of languages related to Uma (Pipikoro) with comments about Uma scattered throughout, is the three-volume study of Adriani – Kruyt (1912-1914). Lesser known studies are the three-volume study of Kulawi by Adriani – Esser (1939), and Esser (1964). More recently,

- 
1. The author has been resident in the Uma area for the bulk of the time since 1980 when he began study of the Uma language as part of a cooperative effort between Hasanuddin University and the Summer Institute of Linguistics under the auspices of the Department of Education and Culture of the Republic of Indonesia.
  2. To the west of the Uma area, along the western coast of Sulawesi, there is a language called *Sarudu* (see Grimes – Grimes 1987: 59). Preliminary assessment of intelligibility and inspection of wordlists both suggest that Sarudu could be considered as either a divergent dialect of Uma, or as a very closely related language. There is also an old migration (over 100 years ago) of people from the Uma village of Kantewu to Bengkulu in South Sulawesi. The people of Bengkulu all adhere to Islam. Within the Seko speaking area of South Sulawesi there is also an enclave of Uma speakers known as the Bana (To Bana).

articles have been published by M.P. Martens (1985, 1988a, b, c, d, e), Gregerson – Martens (1985), and Martens – Martens (1988).

Map 28. Uma language area.

## 2. Summary of the phonology

### 2.1 Inventory of consonants

Table 1. Uma consonants

	Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	p	t	k	ʔ
	vd	b	d	ǰ	g
Prenasalised stops		<sup>m</sup> p	<sup>n</sup> t	<sup>ñ</sup> ç	<sup>ŋ</sup> k
Fricatives		β	s		h
Nasals		m	n	ñ	ŋ
Laterals			l		
Trills			r		

The /β/ is a voiced bilabial fricative. Glottal stop /ʔ/ carries a functional load intervocally and root-finally, but is neutralised with zero word-initially. /h/ functions like a nasal in some respects. It has a nasal quality and causes the nasalisation of following non-front vowels. /l/ is retroflexed contiguous to non-front vowels with older speakers.

Uma has no consonant cluster and no word-final consonants other than glottal /ʔ/. Final glottal occurs in possibly half of the lexical roots in the Uma lexicon and is contrastive with non-glottal roots.

- |     |                |  |             |
|-----|----------------|--|-------------|
| (1) | <i>uma</i>     |  | ‘no’        |
|     | <i>umaʔ</i>    |  | ‘uncle’     |
| (2) | <i>motomo</i>  |  | ‘heavy’     |
|     | <i>motomoʔ</i> |  | ‘delicious’ |

The prenasalised stop series is problematic. Unambiguous syllable types are CV and V encouraging an analysis of prenasalised stops as unit phonemes rather than as consonant sequences. However, in some cases the prenasalisation can be shown to be morphological where they are the result of a verbal prefix /N-/.

- |     |                             |              |           |
|-----|-----------------------------|--------------|-----------|
| (3) | <i>koni</i>                 |              | ‘to eat’  |
|     | <i><sup>h</sup>koni</i>     | /N-koni/     | ‘to eat’  |
| (4) | <i>sarumaka</i>             |              | ‘hope’    |
|     | <i><sup>h</sup>čarumaka</i> | /N-sarumaka/ | ‘to hope’ |

The prenasalised stops can also be shown to be a morphophonemic ligature, such as between a numeral and a classifier.

- |     |                            |              |                        |
|-----|----------------------------|--------------|------------------------|
| (5) | <i>ro-</i>                 |              | ‘two (bound morpheme)’ |
|     | <i>pepaʔ</i>               |              | ‘to be wide’           |
|     | <i>ro<sup>m</sup>pepaʔ</i> | /ro-N-pepaʔ/ | ‘two sheets of’        |

There are, however, unambiguous occurrences of prenasalised stops that cannot be easily reanalysed.

- |     |                          |           |
|-----|--------------------------|-----------|
| (6) | <i>lo<sup>m</sup>peʔ</i> | ‘good’    |
|     | <i>o<sup>n</sup>iʔ</i>   | ‘ant’     |
|     | <i>da<sup>n</sup>či</i>  | ‘bird’    |
|     | <i>la<sup>h</sup>ko</i>  | ‘be tall’ |

## 2.2 Inventory of vowels

Table 2. Uma vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Vowel sequences are common in Uma. Geminate vowels are true vowel sequences, not long vowels. Thus, the sequence CV.V consists of two syllables, regardless of whether or not the vowels are identical.

## 2.3 Stress

Word stress falls on the penultimate syllable of the root. With the addition of suffixes stress shifts to the resulting penultimate syllable. However, with the addition of enclitics stress does not shift to the right. Each vowel counts as the nucleus of a separate syllable.

- (7) ['keni-a] 'carry me' (pronominal enclitic)  
 [ke'ni-a] 'baggage' (carried things)/(nominal suffix)
- (8) ['luna-na] 'its hole for handle' (3sg enclitic)  
 [lu'nana] 'k.o. tree'

Although each vowel is a syllable nucleus and stress falls on the penultimate vowel, there is a blurring that occurs under certain phonotactic conditions. When two vowels occur sequentially in the penultimate and antepenultimate syllables, and the second vowel of which is phonetically higher than the first, the two vowels act as a unit for stress placement (like a unitary diphthong).<sup>1</sup>

- (9) ['paiβa] 'feeding trough'  
 ['pae-a] 'there is rice' (-a is a verbal suffix)  
 ['daeo?] 'grave'

## 3. Morphology

Uma has a morphological system that can be described in terms of Actor-focus and Goal-focus (Object-focus). Because of the alignment of its topic

1. The stress placement is phonetically ambiguous in these conditions.

and non-topic pronominal system, however, Uma can also be described as a morphologically ergative language (see Martens 1988e). Unlike other Kaili languages (see CAD introduction for Da'a), Uma does not have a morphological realis-irrealis distinction marked on the verbs.

Free pronouns are used less frequently than the sets of clitics. When free pronouns are used, they either 1) indicate emphasis or pragmatic prominence, 2) highlight a contrast between one referent and another, or signal an apposition, 3) signal a shift in the story line back to the main character, or 4) function as the object of simple prepositions.

Table 3. Pronominal systems in Uma

	Free pronouns	Absolutive enclitics	Ergative proclitics	Genitive enclitics
1sg	<i>aku?</i>	<i>-a</i>	<i>ku-</i>	<i>-ku</i>
2sg	<i>iko</i>	<i>-ko</i>	<i>nu-</i>	<i>-nu</i> <sup>1</sup>
3sg	<i>hi?a</i>	<i>-i</i>	<i>na-</i>	<i>-na</i>
1pl excl <sup>2</sup>	<i>kai?</i>	<i>-kai</i>	<i>ki-</i>	<i>-kai</i>
1pl incl	<i>kita?</i>	<i>-ta</i>	<i>ta-</i>	<i>-ta</i>
2pl <sup>3</sup>	<i>koi?</i>	<i>-ki</i>	<i>ni-</i>	<i>-ni</i>
3pl	<i>hira?</i>	<i>-ra</i>	<i>ra-</i> <sup>4</sup>	<i>-ra</i>

Absolutive enclitics are used to mark the subject of an intransitive verb or the object of a transitive verb. Absolutive enclitics are the unmarked set and do not necessarily highlight anything pragmatically. They tend to signal given information in the discourse. The absolutive enclitic is the syntactic pivot of the clause.

Ergative proclitics mark the actor of a transitive verb when that actor is non-topic (Goal Focus). Ergative proclitics are obligatory in Goal Focus constructions and are, by definition, non-topic.

Actor-focus and Goal-focus constructions are distinguished morphologically. Actor-focus constructions have the verbal prefix *<sup>m</sup>po-* (*N-po-*) or *mō-*. Goal-focus is, by contrast, unmarked (except by use of the ergative enclitic), and can be considered the normal construction for transitive verbs. The Goal-focus construction is used for simple declarative

1. In the Tobaku, Tolee' and Winatu dialects of Uma 2sg genitive is *-mu*.

2. In the Tolee' and Winatu dialects the 1pl excl forms are *kami?*, *-kami*, *ki-*, and *-kami*.

3. In the Tolee' and Winatu dialects the 2pl forms are *komi?*, *-komi*, *ni-*, and *-mi*.

4. The *ra-* may also be used as an impersonal passive.

verbs as the backbone of a narrative. Actor-focus constructions, on the other hand, tend to be found in relative clauses, in complements of auxiliary verbs, or as non-initial verbs in a string.

Additional affixes are listed below. The list is not exhaustive. Discussion may be found in Martens (1988c).

(10) <i>mo-/ma-</i>	Intransitive (on verbs)
<i>me-</i>	Intransitive (action associated with noun)/ Detransitivises transitive roots
<i>te-</i>	Non-volitional (agentless passive)
<i>pe</i>	Causative
<i>po-/pa-/pe-</i>	Transitive derivational
<i>pe-</i>	Attemptive 'test out, try to do'
<i>me-</i>	Reciprocal
<i>N-</i>	Agentive
<i>ka-</i>	Affected (by the action or state of verb)
<i>ka--GEN</i>	Dependent verb/deverbal noun
<i>po--GEN</i>	Dependent verb (INTRANS)/deverbal noun
<i>li-</i>	Reflexive
<i>haN-</i>	Singular occurrence of ROOT
(11) <i>-i/-hi</i>	Locative
<i>-a</i>	Qualitative/existential 'to be characterised by the presence of ROOT'

#### 4. Morphophonemics

Morphophonemic processes in Uma are of three types: a) involving vowel harmony and ordering changes in clitics, b) prenasalisation caused by prefixing, and c) movement of final glottals with suffixation.

##### 4.1 Vowel harmony and ordering changes in clitics

There are several verbal enclitics which interact with other morphemes triggering vowel harmony and ordering changes. The *perfective -mi* signals completed action. With a stative verb *-mi* indicates a change of state. With imperatives *-mi* strengthens the command. The *continuative -pi* signals a continuation or additive meaning 'still, more', and carries some of the load of the irrealis found in related languages. With a negative *-pi* means 'not any

more, no longer'. With a conditional *-pi* means 'if, when'. In procedural discourse *-pi* marks continuing head-tail linkages. The *contrastive -di* sets off alternatives, contrastive assertions, or contra-expectations and can often be translated 'in fact/actually/but rather'. The *benefactive -ki* encodes datives, benefactives or sometimes other oblique case roles.

**Table 4.** Morphophonemic changes of pronominal clitics with verbal enclitics

	Perfective- <i>MI</i>	Continuative- <i>PI</i>	Contrastive- <i>DI</i>	Benefactive- <i>KI</i>
1sg <sup>1</sup>	<i>tumai-a-ma</i> I came	<i>ane tumai-a-pa</i> If I (still) come	<i>tumai-a-da</i> I did come!	<i>na-wai<sup>?</sup>-ka</i> He gave [it] to me
2sg	<i>tumai-mo-ko</i> You came	<i>ane tumai-po-ko</i> If you (still) come	<i>tumai-da-ko</i> You did come!	<i>na-wai<sup>?</sup>-ko-ko</i> He gave [it] to you
3sg	<i>tumai-i-mi</i> He/she came	<i>ane tumai-i-pi</i> If he/she comes	<i>tumai-i-di</i> She in fact came!	<i>na-wai<sup>?</sup>-ki</i> He gave [it] to her
1pl excl	<i>tumai-ma-kai</i> We(excl) came	<i>ane tumai-pa-kai</i> If we(excl) come	<i>tumai-da-kai</i> We(excl) did come!	<i>na-wai<sup>?</sup>-ka-kai</i> He gave [it] to us
1pl incl	<i>tumai-ta-mo</i> We(incl) came	<i>ane tumai-ta-pa</i> If we(incl) come	<i>tumai-ta-da</i> We(incl) did come!	<i>na-wai<sup>?</sup>-ta-ka</i> He gave [it] to us
2pl	<i>tumai-mo-koi</i> You(pl) came	<i>ane tumai-po-koi</i> If you(pl) come	<i>tumai-da-koi</i> You(pl) did come!	<i>na-wai<sup>?</sup>-ko-koi</i> He gave [it] to you
3pl	<i>tumai-ra-mo</i> They came	<i>ane tumai-ra-pa</i> If they (still) come	<i>tumai-ra-da</i> They did come!	<i>na-wai<sup>?</sup>-ra-ka</i> He gave it to them

## 4.2 Prenasalisation caused by prefixing

There is homorganic nasal accretion before roots beginning with voiceless stops /p t k/.

(12) <i>haN-</i> + <i>pua<sup>?</sup></i>	>	<i>ha<sup>m</sup>pua<sup>?</sup></i>	'a piece'
<i>haN-</i> + <i>toŋo<sup>?</sup></i>	>	<i>ha<sup>n</sup>toŋo<sup>?</sup></i>	'a half'
<i>haN-</i> + <i>ke<sup>?</sup>di<sup>?</sup></i>	>	<i>ha<sup>ŋ</sup>ke<sup>?</sup>di<sup>?</sup></i>	'a little'

There is homorganic nasal substitution before roots beginning with voiced stops /b d g/.

1. Pronominal forms have dialectal variants as described in the notes to table 3.

- (13) *haN-* + *buli* > *hamuli* 'a bunch (of fruit)'  
*haN-* + *dopo* > *hanopo* 'a fathom'

There is laminal prenasal substitution before roots beginning with voiceless fricatives /s h/.

- (14) *haN-* + *hoʔi* > *ha<sup>h̃</sup>čoʔi* 'a bunch/hand (of bananas)'  
*meN-* + *suaʔ* > *me<sup>h̃</sup>čuaʔ* 'to visit'

Before roots beginning with other consonants the nasal element is lost. However, with a few roots beginning with /r/ there is homorganic nasal substitution.

- (15) *raʔa* 'branch'  
*haN-* + *raʔa* > *hanaʔa* 'a branch'

#### 4.3 Movement of final glottals

When suffixes /-i/ or /-a/ are added to roots ending in a glottal /ʔ/, the glottal shifts to the end of the word (following the suffix).

- (16) *ʃilaʔ* 'tongue' + *-i* > *ʃila-iʔ* 'to lick'  
*bereʔ* 'to appear' + *pe--a* > *pe-bere-aʔ* 'place of appearing'

#### 5. Notes on orthography

Table 5. Orthographic conventions for Uma.

## 29. Bugis

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>Husen Abas – Charles E. Grimes</i>
---------------	---------------------------------------

Wordlist:	<i>Husen Abas</i>
-----------	-------------------

---

### 1. Introduction

Bugis is spoken by some 3,600,000 people scattered throughout insular southeast Asia. Approximately 3,100,000 Bugis live in their homeland in South Sulawesi and in most large towns and cities throughout Sulawesi. Large enclaves are also found in Kalimantan, Sabah, Singapore, Surabaya, east Sumatra, and Irian Jaya. The Bugis dominate the lowland areas of South Sulawesi, carrying out extensive wet rice cultivation. At the same time, the Bugis are renowned as seafarers and as boat-builders. The Bugis have had periods of their history in which they dominated not only their immediate region, but also in which their princedoms fought with and related to far-flung sultanates and empires. Thus, not only have the Bugis people had extensive contact with other languages in certain speech domains, but the Bugis language has also been a source of lexical borrowing for many languages throughout the Indonesian archipelago, not just for languages on Sulawesi.

“Bugis” itself is a cover term referring to a semi-cohesive set of princedoms speaking a broad range of speech varieties that differ in historical sound correspondences (e.g. PAN \**b* > /b/ ~ /w/), phonetics, morphological variation, and lexicon. The speech varieties of Bugis are generally assumed to be intelligible either directly with each other, or with an intermediate variety, but more study is clearly needed. Friberg – Friberg (1988) identify the following major dialects of Bugis (with alternate names and subdialects in parentheses): *Bone* (Palakka, Dua Boccoe, Mare), *Pangkep* (Pangkajene), *Camba*, *Sidrap* (Sidenrang, Rappang, Pinrang Utara, Alitta), *Sinjai* (Enna, Palattae, Bulukumba), *Soppeng* (Kessi), *Wajo*, *Barru* (Pare-pare, Nepo, Soppeng Riaja, Tompo, Tanete), *Sawitto* (Pinrang), *Luwu* (Luwu’, Bua Ponrang, Wara, Malangke-Ussu), *Pasangkayu* (Ugi Riawa). *Sawitto* may be divergent enough to be considered a separate language.

*Pangkep* is a dialect area in which Bugis-speaking villages are checker-boarded between Makassar-speaking villages with their separate identities

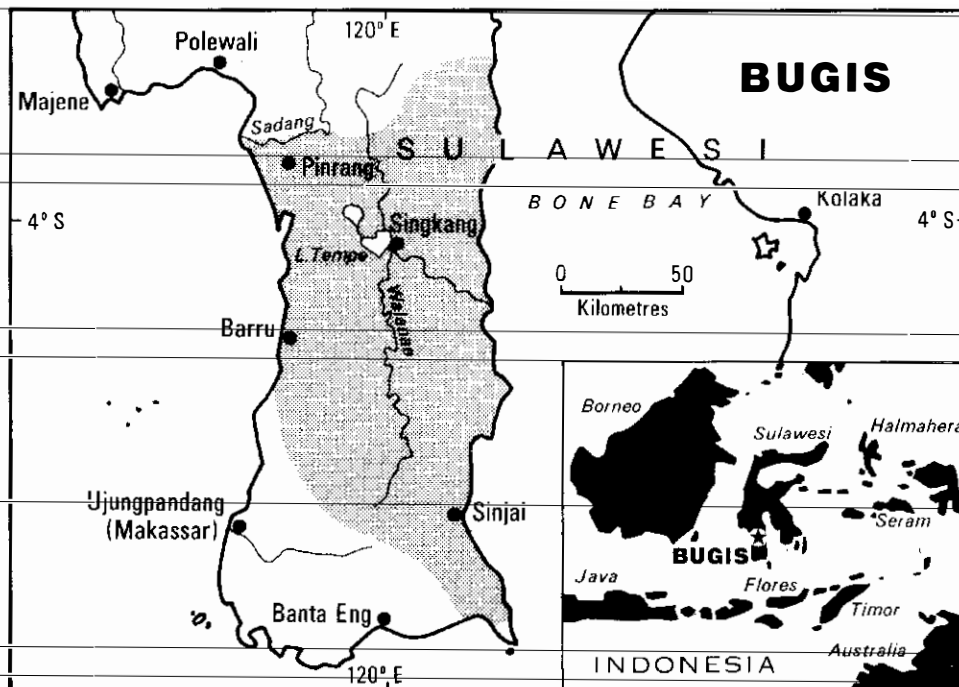

---

---

intact. A popular view holds that there is cultural convergence between Bugis and Makassar, and the literature often assumes there is a “close” linguistic relationship between the two languages, but such an assumption is erroneous (Grimes – Grimes 1987). Several neighbouring languages, such as the Masenrempulu languages, are often incorrectly grouped with Bugis, but that is because of religious, rather than linguistic, criteria; the Muslim speakers of Masenrempulu languages tend to identify with the Muslim Bugis in contrast to the Christian Sa'dan Toraja to the north.

This present description and the data in the wordlist reflect primarily the *Bone* dialect of Bugis, of which Husen Abas is a native speaker.

A growing body of literature is becoming available on Bugis culture, history, demography and language. The cornerstone of Bugis studies are the works of B.F. Matthes. His dictionary (1874b, 1889) and grammar (1875) are among the earliest works of significance on Sulawesi languages. In addition, he published several volumes of Bugis texts and chronicles (1864-1872, 1900) and translated materials (1874a) in the distinctive *lontara* syllabary script used for the Bugis, Makassar, and Mandar languages. Matthes produced many other works on Bugis in addition to those cited above, as well as extensive materials on Makassar and other languages of South Sulawesi.

Map 29. Bugis language area

Of more recent interest related to the Bugis language are a collection of annotated romanised texts by Noorduyn (1955), a generative grammar of the Rappang [Sidrap] dialect by Samsuri (1965), a comparative study of South Sulawesi languages including a sketch of Bugis phonology and morphology by Mills (1975), a dictionary by Ide Said (1977), a study of verb valence and valence-changing devices of the Soppeng dialect by Kaseng (1982), a study of reduplication in Bugis by Kaseng (1983), and a description based on written Bugis by Sirk (1983). Other comparative works of importance to understanding Bugis include a discussion of the morphophonemics of genitive enclitics by Sirk (1988) and notions of ergativity reflected in the verb morphology by B. Friberg (1991).

## 2. Summary of the phonology

### 2.1 Inventory of consonants

In addition to the consonants listed below, /f/ and /x/ are found in loan words, with alternate pronunciations of [p] and [h], respectively. Apical /t/ is phonetically dental. Other apical consonants are alveolar. Trill /r/ tends to become a flap or tap intervocally. Laminals /č/ and /ǰ/ are phonetically alveo-palatal affricates. Lateral /l/ varies in quality from light to dark, with dark /l/ following central or back vowels and light /l/ following front vowels. Semivowels /w/ and /y/ are non-syllabic.

Table 1. Bugis consonants

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>	
Fricatives			<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ɳ</i>	<i>ŋ</i>	
Trills			<i>r</i>			
Laterals			<i>l</i>			
Semivowels		<i>w</i>		<i>y</i>		

All consonants except /ʔ/ occur syllable initially, but in word final position only /ʔ/ and /ŋ/ are found for words that end in a consonant.<sup>1</sup> Clusters of various types occur. Closed syllable structure (C)V(C) with final /ŋ/ and /ʔ/ allows geminate consonants to be analysed as sequences of consonants rather than as a separate consonant grade. All consonants may be geminated except glottals /ʔ h/. Geminate consonants are phonetically longer than a single consonant. Thus /pp/ is a stop held longer than /p/, /rr/ is a trill of longer duration, /ŋŋ/ is a nasal of longer duration, and so forth. As a generalisation, root internal geminate consonants tend to be found only following a stressed vowel. However, single consonants and homorganic nasal-consonant clusters are encountered in the same position. Gemination also occurs as the result of certain morpheme combinations discussed briefly below.

Clusters of /ʔ/ followed by other consonants except /y ŋ/ occur, but this pattern may reflect dialectal and ideolectal alternate pronunciations to geminate consonants. In some dialects glottal followed by a voiced stop is articulated as a light implosive.

A third type of consonant cluster is homorganic nasal + stop or /r/. The sequence /nr/ is phonetically [ndr̥].

## 2.2 Inventory of vowels

Table 2. Bugis vowels

	Front	Central	Back
High	<i>i</i>	<i>ɨ</i>	<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

High vowels /i/ /ɨ/ and /u/ lower to their respective lax allophones [ɪ] [ɨ] and [ʊ] in syllables closed by consonants other than nasals.

Each vowel forms a syllable nucleus. Thus vowel sequences indicate two (or more) syllables. Non-phonemic [w] and [y] may occur as epenthetic glides between non-geminate vowel sequences within morphemes, with [w] following back vowels and [y] following front vowels.

1. Except for final /l r s/ posited for underlying forms which trigger an extrametrical echo vowel followed by a glottal stop, discussed below.

The phonetic range of /i/ varies dialectally in height of articulation between [i] and [a]. Vowel height of /i/ tends to be high between sibilants, but its basic quality depends on both the region of origin of the speaker and the individual speaker. The phonemic status of /i/ is slightly problematic. /i/ does not occur in vowel sequences, nor does it occur in final open syllables. /i/ can be shown to derive historically from several different historical sources. /i/ has variants in some Bugis dialects as [a].

- (1) *bai?* ~ *bara?* ‘west’  
*ali?* ~ *ala?* ‘forest’

### 2.3 Stress

Bugis words are generally stressed on the penultimate syllable. Stress is prototypically indicated by a slight rise in pitch and slight lengthening of the vowel of stressed open syllables.

The addition of phonological suffixes such as the genitive enclitics<sup>1</sup>, the verbal *-iŋ*, or, following vowel-final roots, the proximal deictic *-e* and the locative *-i* all cause stress to shift to the right to fall on the newly formed penultimate syllable. Affixed words are not indicated for stress shift in the wordlist.

In loans ending in /s l r/ an echo vowel is added followed by a glottal. The echo *-V?* is extrametrical and thus does not shift the stress from the penultimate syllable of the underlying root, giving the appearance of antepenultimate stress. This analysis posits underlying roots ending in /s l r/ that trigger the echo *-V?*.<sup>2</sup>

(2) Echo vowels

['kambara?]	←	/kambar/	‘twins’
['kappala?]	←	/kappal/	‘ship’ (loan via Malay?)
['bimbala?]	←	/bimbal/	‘sheep’
['mimbara?]	←	/mimbar/	‘altar, pulpit’ (Arabic)
['dassere?]	←	/dasser/	‘guess’
['sehere?]	←	/seher/	‘magic, witchcraft’ (Arabic)
['čaŋkiri?]	←	/čaŋkir/	‘cup’ (loan via Malay)
['pikkiri?]	←	/pikkir/	‘think’ (Arabic)

1. The genitive enclitics are phonologically suffixes, but grammatically phrase-level enclitics.
2. Mills (1975: 54) attributes *all* Bugis words that exhibit an echo vowel to influence from or via the Makassar language.

['boñčisiʔ]	←	/boñčis/	'bean' (loan via Malay)
['dottoroʔ]	←	/dottor/	'physician' (Dutch?)
['aŋgoroʔ]	←	/aŋgor/	'grape, wine' (loan via Malay)
['komporoʔ]	←	/kompor/	'stove' (Dutch)
['ukkuruʔ]	←	/ukkur/	'measure' (Arabic)
['umuruʔ]	←	/umur/	'age' (Arabic)
['pausuʔ]	←	/paus/	'whale'
['kubburuʔ]	←	/kubbur/	'grave' (Arabic)

### 3. Notes on morphology and morphophonemics

Personal deixis in Bugis is complex with extensive use of honorifics and kin terms in addition to or in place of personal pronouns. First person plural inclusive forms are commonly used as an honorific 2sg.

Free pronouns may occur as subject, object, or object of a preposition. However, the free pronouns normally occur in narrative text for pragmatic prominence, such as in topicalisation constructions or for contrastive emphasis. Participant tracking in discourse is normally born by the use of subject and object affixes on the verb complex. Bugis can be characterised as split-ergative, with the ergative prefixes indexing the actor of transitive verbs, while the absolutive suffixes index the subject of intransitive verbs and the undegoer of transitive verbs. The syntax reflects an accusative system.<sup>1</sup> [2 hon = 2 (honorific); 2 fam = 2 (familiar)].

*Table 3. Personal deixis in Bugis*

	Free pronouns		Ergative	Absolutive	Genitive
	singular	plural	prefixes	suffixes	enclitics
1sg	<i>iyyaʔ</i>		<i>u-</i>	<i>-kaʔ</i>	<i>-ku</i>
1pl/2hon		<i>idiʔ-maniŋ</i>	<i>ki-/ta-</i>	<i>-ki</i>	<i>-ta</i>
2fam	<i>iko</i>	<i>ikoʔ-maniŋ</i>	<i>mu-</i>	<i>-o/-ko</i>	<i>-mu</i>
3	<i>alena/iyya</i>	<i>alena-maniŋ</i>	<i>na-</i>	<i>-i</i>	<i>-na</i>

1. See B. Friberg (1991) for more discussion. The sentence examples below the chart are from her article.

Table 4. Bugis verbal affixes

<i>maN-</i> <sup>1</sup>	Active transitive, actor focus [AF]; usually with transitive verbs or verbs of variable transitivity; does not co-occur with ergative (Undergoer) prefixes.
<i>aN-</i>	Active intransitive.
<i>maR-</i>	With noun root = 'have ROOT'; With active verb roots = 'do ROOT (intransitively)/ (habitually)'
<i>ke-</i>	With noun roots = 'have ROOT' (often interchangeable with <i>maR-</i> ).
<i>ri-</i> <sup>2</sup>	Passive voice, goal focus; agentless passive; agentive passive with NP (non-pronominal agent); may cooccur with other prefixes.
<i>taR-</i> <sup>3</sup>	Involuntary, spontaneous, accidental passive.
<i>pa-</i> <sup>4</sup>	Causative (active, agentive); permissive.
<i>si-</i>	Reciprocal; simultaneous.
<i>ma-</i>	Non-active stative BE (subject of predicate is Undergoer).
<i>ka-</i>	Stative CAUSE BECOME (often with active verb roots)
<i>-(C)i</i> <sup>5</sup>	Locative role repackager (prototypically makes Goal behave as core argument); result is transitive; iterative.
<i>-(C)ij</i>	Non-locative role repackager (repackages which arguments are core); often encodes benefactive/instrumental; resulting construction is transitive.

Combinations of verbal affixes are common (e.g. *appa-* /*aN-pa-*/, *ri-pa-si-*, *riassi-* /*ri-aN-si-*/, *ripataR-* /*ri-pa-taR-*/, *-ij* /*-i-ij*/, etc.). Complex prefixes combined with suffixes are also common (see Kaseng 1982).

Some affixes occur with low enough frequency that they are considered frozen, such as the infix *-in-* 'nominaliser (noun resulting from verb/noun undergoing action of verb)' or another type of stative *ba-*.

1. A few examples reflect an alternate *meN-* (e.g. *me-čawa* 'laugh'), while others reflect a reduced *m-* (e.g. *m-anre* 'eat', *m-inuŋ* 'drink').
2. The Sidrap dialect uses *i-*.
3. With variants *čaR-* and *tiN-* (e.g. *čak-karu?du?* 'sleepy').
4. With low frequency variants *pe-* and possibly *po-*.
5. In a few cases an epenthetic consonant /-k- -s- -r-/ surfaces when suffixes *-(C)i* or *-(C)ij* attach to glottal-final roots. Sometimes the epenthetic consonant reflects a historical consonant (e.g. *nipi?* 'thin', *man-nipi-si* 'make s.th. thin' [see PMP \**nipis* 'thin']). However, several roots can show up in different morphological combinations with alternate consonants /-k- -s- -r-/ surfacing with the same root.

Table 5. Bugis nominal affixation

<i>pa(R)-</i>	1) agent who normally does ROOT or uses ROOT; 2) instrument used to do ROOT; 3) deverbal noun characterising or resulting from ROOT.
<i>si-</i>	One of; singular occurrence of.
<i>-aŋ</i>	1) object or instrument commonly used to do ROOT; 2) location commonly associated with doing ROOT; 3) abstract noun characterising ROOT.
<i>a-ROOT-iŋ</i>	Abstract noun reflecting process, source, result, or location of verbal ROOT.
<i>pa(R)-ROOT-aŋ</i>	Abstract noun reflecting state, goal, or location of verbal ROOT.

### 3.2 Common morphophonemic processes

Morphophonemic /...N-/ /...R-/ and final /ŋ/ or /ʔ/ trigger several processes at morpheme boundaries and across word boundaries within the clause.

/...N-/ /...R-/ or /ŋ ʔ/ followed by voiceless stops, nasals, /s r l y/ assimilate to the following consonant, resulting in a geminate consonant:

(8) <i>mattunu</i>	←	/maN-tunu/	‘burn s.th., bake s.th.’
<i>attunuŋ</i>	←	/aN-tunu-aŋ/	‘oven’
<i>mappidde</i>	←	/maN-pidde/	‘extinguish (fire)’
<i>mallimmiʔ</i>	←	/maN-limmiʔ/ <sup>1</sup>	‘bury (the dead)’
<i>pakkampiʔ</i>	←	/paR-kampiʔ	‘herdsman, goatherd’
<i>aññawaŋ</i>	←	/aN-ñawa-aŋ/	‘lung’
<i>massiriŋ</i>	←	/maN-siriŋ/	‘sweep’
<i>tassolla</i>	←	/taR-solla/	‘slide, slip’

/...N-/ /...R-/ or /ŋ ʔ/ followed by voiced stops become geminate voiced stops, with alternate pronunciations of glottal + voiced stop or light implosive:<sup>2</sup>

1. The *maN-* prefix clearly contrasts with the stative *ma-*, cf. *ma-lisi* ‘strong’.
2. Initial /w/ behaves morphophonemically as if it were a /b/, resulting in [bb] or [ʔb]. Bugis initial /w/ derives from \*b.

(9)	<i>majjimmu?</i>	←	/maN-ʃimmu?/	‘knead’
	<i>aggiliŋiŋ</i>	←	/aN-giliŋ-iŋ/	‘mill’
	<i>pajjai?</i>	←	/paR-ʃai?/	‘tailor’

/...N-/ followed by a vowel becomes /k/ or /ŋ/ followed by that vowel. The consonant is sometimes geminated:

(10)	<i>maŋŋaniŋ</i>	←	/maN-aniŋ/	‘weave’
	<i>maŋemboŋ</i>	←	/maN-emboŋ/	‘shake’
	<i>makkiriŋ</i>	←	/maN-inriŋ/	‘owe’

/...R-/ followed by a vowel becomes /r/ or /rr/ followed by that vowel:

(11)	<i>marakka?</i>	←	/maR-akka?/	‘raise, lift’
	<i>marala</i>	←	/maR-ala/	‘get, obtain’

Morphological combinations of *e + e* and *i + i* trigger *w*-insertion:<sup>1</sup>

(12)	<i>utudaŋŋiwi</i>		<i>kaderaewe.</i>
	u-	tudaŋ-Ci -i	kadera-e -e
	1sgERG-sit	-LOC-3ABS	seat -ART-DISTAL
	‘I’m sitting on that chair.’		

Under some conditions that morphologically yield a sequence of vowels *V + V*, the first vowel is deleted.

The behaviour of the genitive enclitics deserves mention. Sirk (1988) discusses this in more detail. Final dorsal /ŋ/ or glottal /ʔ/ assimilate to the consonant of the genitive enclitic:

(13)	<i>jaruŋ</i>	‘needle’	
	<i>jarukku</i>	‘needle-1sgPOSS’	← /ʃaruŋ-ku/

Following vowels, however, two patterns emerge. Following mid vowels /e o/, and sometimes /a/, no gemination is triggered:<sup>2</sup>

(14)	<i>bua-na</i>	‘fruit-3sgPOSS’	<	<i>*buaq</i>
	<i>dara-mu</i>	‘blood-2fPOSS’	<	<i>*daRaqa</i>

Following high vowels /i u/ and other final /a/ morphemes, gemination of the consonant of the genitive enclitic is triggered:

1. Example from Friberg (1991).

2. Sirk points out that Bugis /e/ derives from the historical combinations of Pre-South Sulawesi *\*-iq* and *\*-ay*, /o/ from *\*-uq* and *\*-aw*, and the /a/-final roots that do not trigger gemination derive from *\*-aq*.

(15) <i>lima-mmu</i>	‘hand-2fPOSS’
<i>mata-nna</i>	‘eye-3sgPOSS’
<i>ulu-kku</i>	‘head-1sgPOSS’

### 3.3 Reduplication

Reduplication in Bugis is pervasive. The forms and functions of reduplication are far too numerous and complex to summarise here. The interested reader is referred to Kaseng (1983) and other sources.

### 4. Notes on orthography

The variety of orthographies for Bugis are almost as numerous as the sources on the language. Several problems mitigate against easy solutions for a “standard” orthography for Bugis. Firstly, the dialects are numerous and both phonetically and lexically diverse. Secondly, even for speakers of the same dialect there are disagreements as to how such things as geminate consonants should be indicated. For example, /VCCV/ has been written: *v cv*, *vccv*, *vvcv*, *v'cv*, *vCv*, *vchv*, and possibly other ways as well. Another area that triggers various creative solutions is whether to maintain morpheme recognition or to follow the surface form. The vowel /i/ has occasioned a variety of solutions, including a variety of diacritics over different vowels. Orthography problems are further compounded by features such as gemination which are sometimes hard to distinguish and are written inconsistently across sources.

Most Bugis material, even today, is written in the *Lontara* syllabary. This syllabary, while yielding a wealth of written material in the Bugis language going back several centuries, nevertheless underdifferentiates several important phonological aspects of the language. For example, the *lontara* is principled around open syllable structure and is thus inadequate for indicating final /ʔ/ or /ŋ/, or for mapping geminate consonants. Only four nasal-consonant clusters (open syllable NCV) are accounted for. /a/ is the unmarked vowel, with other vowels (including /i/) indicated by diacritics above or below the graph. Studies of the phonology and morphology of Bugis based primarily on texts written in *lontara* rather than on spoken Bugis are fraught with pitfalls.

## 30. Konjo

---

---

**Contributor:**

Introduction and Wordlist: *Timothy Friberg*

---

---

### 1. Introduction

---

Konjo is spoken by some 200,000 people living in South Sulawesi. It lies between the dominant Bugis and Makassar languages, and has frequently been called a dialect of Makassar, primarily for socio-political reasons. Konjo shares a number of features with both Bugis and Makassar, but as a member of the Makassar chain of languages (Grimes – Grimes 1987), it is more closely related to Makassar and Selayar than to Bugis, which latter is not a member of the Makassar chain. Konjo and Makassar are end points of a dialect chain, separated lexico-statistically at about 70%.

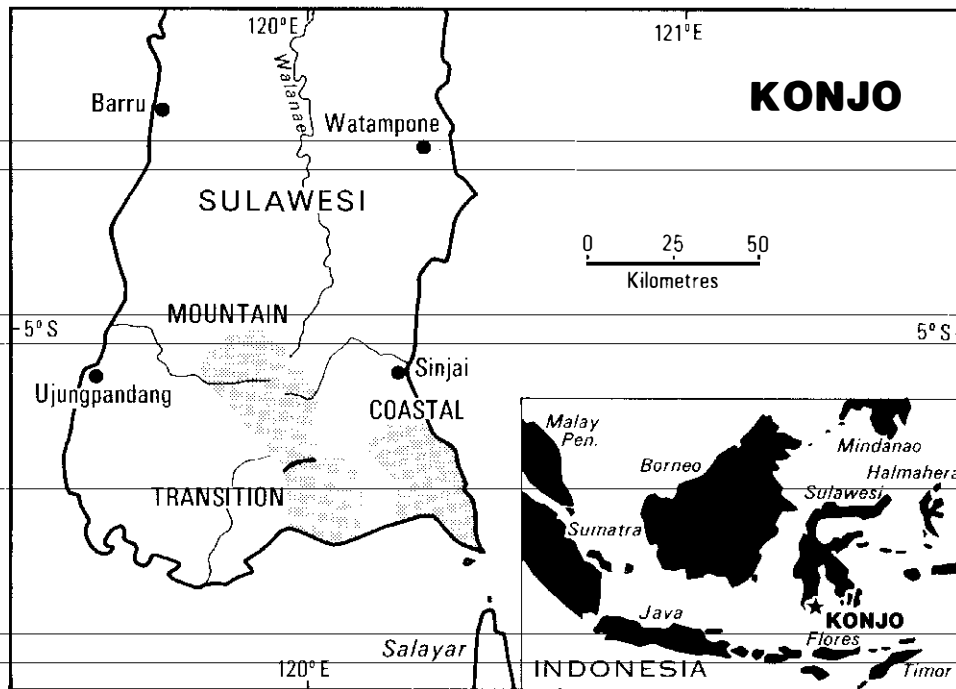

Within Konjo there are two major speech varieties, here termed Mountain Konjo and Coastal Konjo (after Grimes – Grimes 1987). In terms of intelligibility and lexicostatistics (75%), they should be considered separate languages. There is minimal chaining between them. However, their phonologies are nearly identical. With only minor morphophonemic, morphological and syntactic differences, the factor which makes them distinct is their vocabularies.

This description reflects the Coastal Konjo language situation. The Coastal Konjo number about 125,000 and live mainly in the four east-coastal subdistricts of Bulukumba district. Coastal Konjo is itself a dialect chain running north and south. The changes are small between adjacent communities. The whole chain represents a divergence of perhaps 10-15%. The most marked differences are at the northern and southern extremes. At the northern end lies the culturally distinct Tana Toa area. It is not certain whether the differences are due to influence of the Bugis language or that they are, as they claim to be, the original Konjo who have refused to have much to do with outside influences. In the south the Ara and Bira areas are distinct, showing an increasing affinity with insular Selayar to the south. Fishing and boating are an integral part of the lives of the people in Ara and Bira and thus there is much contact with nearby islands. Again, the differences noted are largely lexical. The field work giving rise to these

---

---

notes was carried out in the twin villages of Jannaya and Kalimporo in Kajang subdistrict. Just to the northwest lies Tana Toa.

Map 30. Konjo language area

## 2. Summary of the phonology

### 2.1 Stress

Konjo words are generally stressed on the penultimate syllable. Exceptions to this rule are marked for stress in the wordlist. Suffixes /-aŋ, -na, -i/ etc. cause the stress to shift to the right. Affixed words are not indicated for stress shift in the wordlist.

In underlying forms /r l s/ are posited as syllable-final or word-final consonants. Stress is applied in a regular manner, so that all words receive penultimate stress, then later an echo vowel (a copy of the vowel preceding the final /r l s/) is added. Recognising the underlying final consonant yields a closed syllable. This also allows the clear presentation of geminate consonants as two phonemes rather than one (as has been posited by others in previous attempts at analysing Makassar and Bugis). The syllable structure is thus straightforward (C)V(C).

(1) Echo vowels

['təllasa]	<	/tallas/	‘to live, be alive’
['gunturu]	<	/guntur/	‘thunder’
['kəppala]	<	/kappal/	‘ship’

2.2 Inventory of consonants

Table 1. Konjo consonants

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ǰ</i>	<i>g</i>	
Fricatives				<i>s</i>		<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ṅ</i>	<i>ŋ</i>	
Trills			<i>r</i>			
Laterals			<i>l</i>			

Apical /t/ is phonetically dental. Other apical consonants are alveolar. Laminals /č/ and /ǰ/ are phonetically alveopalatal affricates. The sequence /nr/ is phonetically [ndr̥]. Geminate consonants are phonemically sequences of consonants and phonetically longer than a single consonant. Thus /rr/ is a trill of longer duration, /tt/ is a stop of longer duration, and so forth.

All consonants except /ʔ/ occur syllable-initially, but in syllable-final and word-final position only /r̥/ and /ŋ/ are found (with the exception of /s r l/ described above which trigger an echo vowel).

The semivowel /w/ does not occur. /w/ is represented in correspondence sets with related languages by /h/ and /b/.

(2)	Makassar	/bawi/	‘pig’	<	PMP *babuy	‘pig’
	Konjo	/bahi/	‘pig’			
(3)	Makassar	/bawa/	‘mouth’	<	PMP *baqbaq	‘mouth’
	Konjo	/baba/	‘mouth’			

[y] arises only by epenthesis at morpheme boundaries. What is /y/ in other languages is usually borrowed into the Konjo language as /ǰ/ and a putative proto-\*y has become /ǰ/ in Konjo.

- (4) Makassar /kayu/ 'wood' < PAN \*kaSiw 'tree, wood'  
 Konjo /kaʃu/ 'wood' PMP \*kayu

There is variation between /l/ and /n/ in a few words, the latter perhaps being from neighbouring Bugis.

- (5) [ta'lia] ~ [ta'nia] 'not'

There is widespread variation between /č/ and /s/.

- (6) [čidoŋ] ~ [sidoŋ] 'to sit'

Root words of two and three syllables are common. Root words of four or five syllables are not uncommon, e.g., [binsa'lessere] 'a kind of parrot'. Words with derived and inflected affixes may number seven or more syllables.

### 2.3 Inventory of vowels

Table 2. Konjo vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

There is phonetic alternation between [a] and [ə], the latter occurring before phonetic geminates. Actually there are three vowel heights for /a/: low, before single consonant segments or nongeminate sequences; raised [â], before voiceless geminates and nonnasal sonorant geminates; and schwa [ə] before nasal geminates. A few nongeminate sequences show a raised vowel, e.g. [lântaŋ] 'deep'. Thus,

- (7) /a/ > [a] ['batu] 'rock' [maka] 'ordinaliser'  
 [â] ['bâttu] 'come from' [nu'mâkkala] 'to laugh'  
 [ə] ['bønne] 'seed rice' [mənŋaŋ] 'weary'

/e/ also has variants, [ɛ] (lax) before nasal-stop sequences and in open syllables, and [e] (tense) elsewhere, even before geminate stops and geminate

nasals. Some free variation has been noted, but has not been mapped either geographically or sociolinguistically.

(8)	['bembɛ]	'goat'	['kɛkɛ]	'to dig'
	['deppa]	'kind of cake'	['kekkeʔ]	'torn'
	['bentɛŋ]	'pillar'	['lɛlɛŋ]	'do repeatedly'

There is some hint of the typical Austronesian /i/ and /e/ as well as /u/ and /o/ variation, but quite minimally.

(9)	['miaʔ]	~	['meaʔ]	'to speak'
	[am'baon]	~	[am'baun]	'to rise'

However, there are also minimal pairs that permit no variation.

(10)	['pao]	'mango'
	['pau]	'to report'

The five vowels may appear in sequence, that is, without an intervening consonant. These are real sequences of vowels and not merely diphthongs. When the stress is on the first vowel of a sequence in root forms, the addition of a stress-changing suffix will shift the stress to the second member of the pair. Sequences of like vowels arising through morpheme concatenation are disallowed by either of two rules, Vowel Degemination or Vowel Glottalisation, both rules maintaining the preferred CV syllable structure. Potential /ei, ou, uo/ sequences might be disallowed because of phonetic nearness; indeed /ie/ is found in only a few root words, and thus the symmetry is nearly complete; an example of this is /rieʔ/ 'to be', a high frequency word.

## 2.4 Underlying and surface forms

The variances in the surface forms of Konjo can best be accounted for by positing underlying forms which differ in a number of respects from the surface forms. A detailed description of the Konjo phonology including the rules to derive the surface forms from their underlying forms is presented in Friberg – Friberg (1989).<sup>1</sup> The details are particularly significant when considering Konjo morphophonemics, as there is extensive assimilation,

1. The morphophonemic processes in Konjo are far more complex than what is summarised below. For a discussion of additional processes and greater detail than is found here the reader is referred to Friberg – Friberg (1989).

nasal gemination, etc., across morpheme boundaries which greatly complicates the surface forms. Some of the morphophonemic processes are summarised here.

### 2.4.1 Nasal /ŋ/

/ŋ/ assimilates to the point of articulation of the following consonant, that is, to [m n ñ ŋ], both word medially and across morpheme boundaries.

- |      |                   |   |                |                 |
|------|-------------------|---|----------------|-----------------|
| (11) | <i>ambindoeki</i> | < | /aŋ-bindoek-i/ | ‘hang s.th. up’ |
|      | <i>anrui</i>      | < | /aŋ-rui/       | ‘to pull’       |
|      | <i>aŋgentuŋ</i>   | < | /aŋ-gentuŋ/    | ‘hang s.th. up’ |

When followed by a voiceless stop or /s/, the second consonant in the cluster further assimilates to the preceding nasal.<sup>1</sup>

- |      |                  |   |              |             |
|------|------------------|---|--------------|-------------|
| (12) | <i>ammirua?</i>  | < | /aŋ-pirua?/  | ‘to vomit’  |
|      | <i>annettere</i> | < | /aŋ-tettere/ | ‘to shiver’ |
|      | <i>aŋŋokko?</i>  | < | /aŋ-kokko?/  | ‘to bite’   |
|      | <i>añña?riŋ</i>  | < | /aŋ-sa?riŋ/  | ‘wake up’   |

When followed by a root beginning with /l/, the nasal assimilates to the lateral.

- |      |                 |   |             |             |
|------|-----------------|---|-------------|-------------|
| (13) | <i>allappa?</i> | < | /aŋ-lappa?/ | ‘to fold’   |
|      | <i>allañña?</i> | < | /aŋ-lañña?/ | ‘disappear’ |

When followed by a vowel-initial root, there is nasal gemination.

- |      |                |   |           |            |
|------|----------------|---|-----------|------------|
| (14) | <i>aŋŋeraŋ</i> | < | /aŋ-eraŋ/ | ‘to carry’ |
|      | <i>aŋŋalle</i> | < | /aŋ-alle/ | ‘to bring’ |
|      | <i>aŋŋuppa</i> | < | /aŋ-uppa/ | ‘to get’   |

When followed by a root beginning with /h/, the transitive prefix /aŋ-/ surfaces as a geminate *amm*-<sup>2</sup>.

- |      |                   |   |               |           |
|------|-------------------|---|---------------|-----------|
| (15) | <i>ammuno</i>     | < | /aŋ-huno/     | ‘to kill’ |
|      | <i>ammunŋkara</i> | < | /aŋ-hunŋkara/ | ‘untie’   |

1. This pattern is followed by the transitive indefinite usage of the prefix /aŋ-/. For the transitive definite usage of /aŋ-/the following consonant does not assimilate to the nasal (see Friberg – Friberg 1989, for details).

2. It was noted earlier that /h/reflects a historical \*b. Thus, having the nasal of the prefix surface as a labial is not as unusual as it might first seem.

### 2.4.2 Glottal /ʔ/

Glottal /ʔ/ assimilates to the point of articulation of following consonants.<sup>1</sup>

(16)	[atlaulau]	<	/aʔ-lau-lau/	‘yawn’
	[ačñaha]	<	/aʔ-ñaha/	‘breathe’
	[akŋoroʔ]	<	/aʔ-ŋoroʔ/	‘snore’
	[atdeŋka]	<	/aʔ-deŋka/	‘to pound in a mortar’
	[apbaʃu]	<	/aʔ-baʃu/	‘to put on (clothes)’

Thus the intransitive prefix /aʔ-/ surfaces as a geminate sequence before /p t č k s/.

(17)	<i>assoŋoʔ</i>	<	/aʔ-soŋoʔ/	‘to perspire’
	<i>appeʔru</i>	<	/aʔ-peʔru/	‘to spit’
	<i>attunu</i>	<	/aʔ-tunu/	‘roast’
	<i>akkalloŋ</i>	<	/aʔ-kalloŋ/	‘to choke’

Before a vowel-initial root the intransitive prefix /aʔ-/ surfaces as a geminate sequence *amm*.

(18)	<i>ammore</i>	<	/aʔ-ore/	‘cold (catarrh)’
	<i>ammitiʔ</i>	<	/aʔ-itiʔ/	‘turn around’

### 2.4.3 Doubling of root-final consonants

Root final consonants /ŋ ʔ r l s/ are geminated before derivational suffixes.

## 3. Grammar

Konjo is typical of a number of the languages in Sulawesi. VSO is its basic word order, with much variation from that order due to fronting of whatever is in focus in the sentence. The morphology is rich with a number of derivational affixes, clitics and limited inflectional affixes. Although there are clear distinctions between nouns, transitive and intransitive verbs, emotive and other adjectives in their base forms, any of these can freely be extended to nouns or verbs with all the incumbent morphology. The suffix set consists primarily (although other suffixes and clitics are found as well)

1. In the word list intransitive /aʔ-/ is written as *aʔ-* rather than indicating the assimilation to point of articulation. Before /s/ it is written as *as-*.

of a benefactive suffix /-aŋ/ and a transitiviser or locationaliser suffix /-i/, as found in many Austronesian languages.

Free pronouns occur as subject or object and both only when emphasised. It is the verbal affixes that carry the major burden of pronominalisation. Only here is there an ergative system functioning; syntactically Konjo functions as an accusative system. A set of ergative prefixes and absolutive suffixes occur as follows (the possessives are included here for convenience):

*Table 3. Konjo pronominal affixes*

	Ergative	Absolutive	Possessive
1sg	<i>ku-</i>	<i>-a</i>	<i>-ku</i>
1pl	<i>ki-</i>	<i>-ki</i>	<i>-ta</i>
2 hon	<i>ki-</i>	<i>-ki</i>	<i>-ta</i>
2 fam	<i>nu-</i>	<i>-ko</i>	<i>-nu</i>
3	<i>na-</i>	<i>-i</i>	<i>-na</i>

There is interesting movement of the absolutive suffixes, along with their preceding aspect markers, to follow whatever is fronted in the sentence. Along with this there is the phenomenon that when the fronted word cannot readily take the absolutive suffix, it forces it to be prefixed to the full verb form as an ergative form. For some examples of the morphology of several languages in South Sulawesi, see B. Friberg (1991).

Adjectival morphology consists mainly of denominal and deverbal derivation. Emotive adjectives are singled out because they demand a different deverbal derivation from other adjectives. Nouns may undergo verb derivation, be possessed and derive to other types of nouns. The complexity rises with the possibility of several levels of derivation. A noun derived from a verb may in turn be verbalised. A possessed verb becomes a kind of gerund or a subordinated temporal clause.

## 1. Introduction

Wolio is one of several languages spoken on the islands off south-east Sulawesi. Wolio is spoken primarily on the island of Buton (Butung), the largest of these islands. However, “Buton” is also the generic term used in other parts of the archipelago for all the islands off south-east Sulawesi. People referred to as *orang Buton* ‘Butonese’ are found throughout most parts of coastal Maluku and parts of Sulawesi and Nusa Tenggara. They are renowned as seafarers, boat-builders, fishermen, gatherers of *tripang* ‘sea cucumber’ and commercial seashells, and as seafaring merchants, with many old trade items (such as brass gongs) used as items of bridewealth in parts of eastern Indonesia known to be purchased from *prahu Buton* ‘boats from Buton’. Colonies from the Buton region established for many generations are found on the west coast of Irian Jaya, Seram, Sula, Buru, and elsewhere with some communities numbering well over one thousand persons. Regular contact continues to be maintained with the homeland areas with each monsoonal season. People from “Buton” are often acknowledged as the source of know-how and lexical borrowings related to the sea for mountain-oriented cultures such as those found in Buru, Ambon and Seram. The difficulty, however, is that the “Buton” region is by no means homogeneous. Numerous ethno-linguistic groups are captured by the one generic term.

Since at least the 16th century and on through the Dutch era and now in modern times, the port of Baubau on the island of Buton has served as a stopover for ships travelling from both Ternate and Ambon to Makassar. It is in this port area and in surrounding villages that the Wolio language is spoken.

- 
1. J.C. Anceaux began work on his Wolio contribution to CAD prior to his death in 1988. René van den Berg has not only been able to check the material extracted from Anceaux (1987) with speakers of Wolio, but also has been able to add material not found in Anceaux’s dictionary.
-

Although Wolio is the mother tongue of people in only a few villages centred around Baubau in the south-western part of the island of Buton, it was once the official language of the Islamic sultanate of the region seated in Baubau and was apparently also the language of the nobility in the greater “Buton” region where other languages are also spoken. Associated with the old sultanate is a body of traditional literature and poetry in the Wolio language written in an adaptation of the Arabic script with a few manuscripts also known to exist in the Makassar *Lontara* syllabary (Anceaux 1952: 2). Speakers of Wolio number between 25,000 - 35,000.

The languages off south-east Sulawesi are poorly known, with the exception of Wolio (Anceaux 1952, 1987), and more recently Muna (R. van den Berg 1989). A survey of part of the region, with data, is presented in Anceaux (1978). R. van den Berg (1989) gives a brief comparative study of the area with information on previously undocumented languages, and comments that there is much still unknown about the languages in the area. The Dutch language officer in the region from 1936-1941, E.J. van den Berg, was killed during the Second World War and his documents were lost. All that remains are his reports, edited by A. A. Cense (1954).

Esser (1938) classified the languages on the islands off south-east Sulawesi as the “Muna-Buton” group, associating the Buton languages with the nearby Muna language. Esser’s classification has been followed unchallenged by subsequent writers, but the basis for such a genetic subgrouping has not been demonstrated.<sup>1</sup> Neither has there been a satisfactory study on the relationship of the Muna languages and the Buton languages with the Bungku languages of mainland south-east Sulawesi. Wolio itself does not appear to group neatly within either the Muna languages or the Buton languages, but probably groups together with them at a higher level (see Anceaux 1978, R. van den Berg 1989).<sup>2</sup> The apparent divergence may be masked by contact-induced changes due to the role of Wolio as the official language of the sultanate at Baubau having more intense contact with Arabic, Ternate, Makassar, and Bugis than did the surrounding vernacular languages.

1. The position of these languages within Western Malayo-Polynesian is also not clear (assuming WMP can be shown to be a distinct genetic grouping). Are they, as Esser (1938) implies, a first-order subgroup of WMP, or do they group with the languages of south Sulawesi, central Sulawesi and south-east Sulawesi in a “Nuclear Sulawesi” group separate from the Gorontaloic, Minahasan, and Sangiric languages?
2. R. van den Berg (1989: 2) notes, “The position of Wolio, in many respects deviant from the neighbouring languages, is still an open question.”

## 2. Phonology and morphophonemics

### 2.1 Word stress

Words are stressed on the penultimate syllable. With the addition of syllabic suffixes onto the root stress shifts to the right to the newly derived penultimate syllable.

- (1) ['taŋi]            'cry'  
       [taŋi-'aka]      'cry about s.th.'

### 2.2 Inventory of consonants

Table 1. Wolio consonants

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	v	<i>p</i>	<i>t</i>	<i>ɕ</i>	<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ʝ</i>	<i>g</i>	
Prenasalised stops	v	<i><sup>m</sup>p</i>	<i><sup>n</sup>t</i>	<i><sup>ɲ</sup>ɕ</i>	<i><sup>ŋ</sup>k</i>	
	vd	<i><sup>m</sup>b</i>	<i><sup>n</sup>d</i>	<i><sup>ɲ</sup>ʝ</i>	<i><sup>ŋ</sup>g</i>	
Fricatives		<i>w</i>	<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals			<i>l</i>			
Trills			<i>r</i>			

The /w/ is phonetically a lightly fricativised voiced bilabial fricative [β]. The prenasalised stops are considered here as unit phonemes rather than sequences of two phonemes. More will be said on this below.

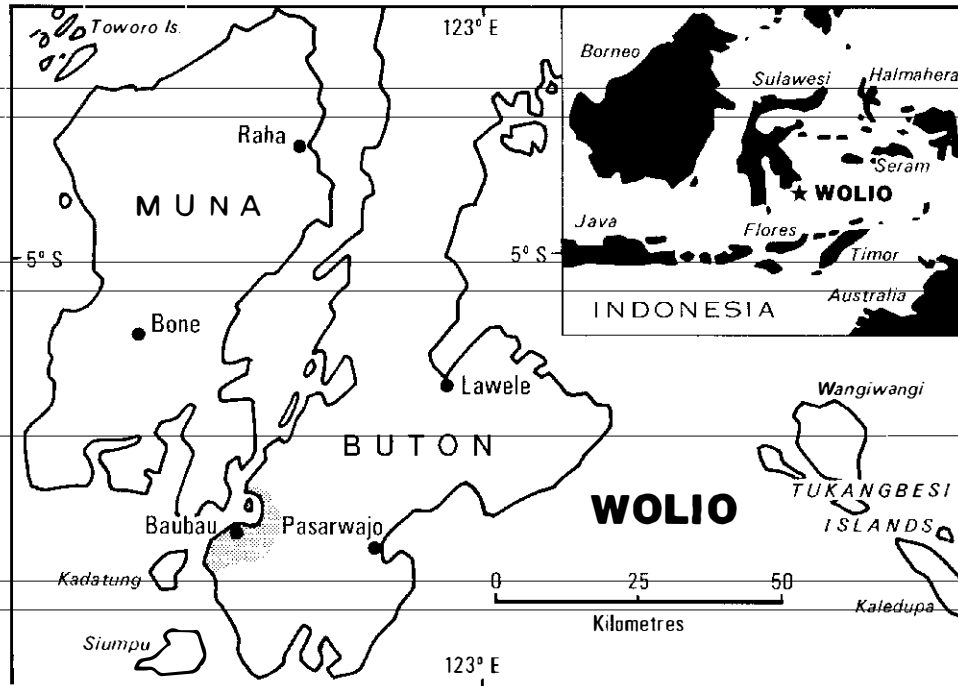

Additional phonemes are found in loan words. Non-implosives /b/ and /d/, and voiceless fricative /f/ are found in loans, mostly of Arabic origin.

### 2.3 Inventory of vowels

Table 2. Wolio vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Unambiguous syllable types are CV and V. Thus, in Wolio each vowel forms the nucleus of a syllable. Vowel sequences, which may be of either like or unlike vowels, cross syllable boundaries.

Map 31. Wolio language area.

## 2.4 Behaviour of loan words

In Wolio, final consonants of some loans are lost. More often than not, however, the final consonant is retained and a paragogic vowel is added following the final consonant to maintain the constraint of open syllable structures. A pattern for predicting which vowel will appear is not self-evident. As with loans in Muna (R. van den Berg 1991: 33ff.) Wolio breaks up consonant clusters with the insertion of a vowel.

(2)	<i>koburu</i>	'grave'	[Arabic loan via Malay <i>kubur</i> ]
	<i>wakutuu</i>	'time'	[Arabic loan via Malay <i>waktu</i> ]
	<i>pikiri</i>	'think'	[Arabic loan via Malay <i>fikir/pikir</i> ]
	<i>dafatari</i>	'list'	[loan via Malay <i>daftar</i> ]

### 3. Morphology

Personal deixis in Wolio is indicated by various sets of pronouns and clitics. Free pronouns may be used in topicalisation constructions indexed by pronominal clitics on the verb, or they may be used within the clause proper in place of a subject proclitic. Whether to use a free pronoun or a pronominal proclitic is a factor of the pragmatics of discourse. Free pronouns tend to signal new information in which a participant is being introduced or reintroduced. The use of clitics signals given information in which there is an anaphoric or exophoric referent.

Subject proclitics indicate the preverbal core argument in an active declarative clause. With active verb stems they indicate the subject as Actor.<sup>1</sup> With non-active verb stems they indicate the subject as Undergoer. The set of object clitics indexes the pronominal object of transitive verbs. The set of genitive enclitics indicates possession or close association. In combination with the passive prefix *i-* (promotion of Undergoer, demotion of Actor), the genitive enclitics are used to indicate the Actor.

First person plural (inclusive) forms may be used honorifically for second person singular.

Table 3. Personal deixis in Wolio

	Free pronouns	Subject proclitics	Object clitics	Genitive enclitics
1sg	<i>iaku</i>	<i>ku-</i>	<i>-aku</i>	<i>-ku</i>
2sg	<i>i<sup>h</sup>koo</i>	<i>u-</i>	<i>-ko</i>	<i>-mu</i>
3sg	<i>i<sup>n</sup>ɕia</i>	<i>a-</i>	<i>-a(-ia/-ca)</i>	<i>-na</i>
1pl excl	<i>i<sup>h</sup>kami</i>	<i>ta-</i>	<i>-kami</i>	<i>-mami</i>
1pl incl	<i>i<sup>h</sup>kita</i>	<i>ta-</i>	<i>maŋa-</i>	<i>-ta</i>
2pl	<i>i<sup>h</sup>komiu</i>	<i>u-</i>	<i>-komiu</i>	<i>-miu</i>
3pl	<i>i<sup>n</sup>ɕia</i>	<i>a-</i>	<i>-a(-ia/-ca)</i>	<i>-na</i>

Two verbal suffixes (*-(C)i*, *-(C)aka*) and a nominal suffix (*-(C)a*) occasionally appear with an extra consonant. In general, historical final consonants are lost in Wolio. Some of the final consonants that surface with the addition of these suffixes can be explained as historical retentions.

1. The terms “Actor” and “Undergoer” are used here in the sense of the macro-roles described by Foley – Van Valin (1984).

Many, however, cannot be explained as retentions of historical final consonants. Each lexeme must be indicated in a dictionary with its own derivations.<sup>1</sup>

The suffix *-(C)i* involves a locative or locative goal in the interpretation of the role structure of the verb. The use of *-(C)i* implies a definite referent.

(3)	<i>ko<sup>m</sup>pa</i>	‘climb’ (intransitive)	
	<i>ko<sup>m</sup>pa-si</i>	‘climb s.th.’ (e.g. tree)	
(4)	<i>mai</i>	‘come’	< PMP * <i>maRi</i> ‘come’
	<i>mai-si</i>	‘come to (place)’	
(5)	<i>ʃatu</i>	‘stone (n)’	< PMP * <i>ʃatu</i> ‘stone’
	<i>ʃatu-i</i>	‘stone s.o./s.th.’	
(6)	<i>ma-taʃa</i>	‘be sharp’	< PMP * <i>taZem</i> ‘sharp’
	<i>taʃa-mi</i>	‘sharpen s.th.’	
(7)	<i>aʃa</i>	‘ask’	
	<i>aʃa-ki</i>	‘ask s.o.’	
(8)	<i>taŋi</i>	‘cry’	< PMP * <i>taŋis</i> ‘cry’
	<i>taŋi-si</i>	‘cry over s.o.’	

The suffix *-(C)aka* also requires reinterpreting the role structure of the verb. The suffix repackages the role structure to involve as core arguments such things as a direct object, indirect object, benefactive, or instrumental. The referent indexed by *-(C)aka* is also definite.

(9)	<i>po-tawa</i>	‘laugh’	< PMP * <i>tawa</i> ‘laugh’
	<i>po-tawa-aka</i>	‘laugh at s.th./s.o.’	
(10)	<i>gora</i>	‘exclaim’	
	<i>gora-aka</i>	‘call to s.o.’	
(11)	<i>ʃawu</i>	‘give (s.th.)’	
	<i>ʃawu-aka</i>	‘give to s.o.’	
(12)	<i>ʃika</i>	‘put/place’	
	<i>ʃika-aka</i>	‘put for s.o. (on their behalf)’	
(13)	<i>ʃeʃe</i>	‘hit’	
	<i>ʃeʃe-aka</i>	‘hit with s.th.’	

1. The epenthetic consonant is never a prenasalised stop. Epenthetic consonants can be analysed as either belonging to an allomorph of the root or alternatively as belonging to an allomorph of the suffix. Some roots have alternate forms with and without the epenthetic consonant (e.g. *rambi* ‘beat’, *rambi-aka/rambi-taka* ‘beat s.th.’).

The functions of the two suffixes can be seen in contrast with each other on the same root.

(14) <i>aʔa</i>	‘ask’	
<i>aʔa-ki</i>	‘ask s.o.’	
<i>aʔa-aka</i>	‘ask about s.th.’	
(15) <i>taʔi</i>	‘cry’	< PMP * <i>taʔis</i> ‘cry’
<i>taʔi-si</i>	‘cry over s.o.’	
<i>taʔi-aka</i>	‘cry about s.th.’	
(16) <i>tutu-ki</i>	‘pound s.th.’	< PMP * <i>tuktuk</i> ‘pound’
<i>tutu-aka</i>	‘pound for s.o.’	

Other affixes are broadly summarised below. For more detailed discussion and examples see Anceaux (1952). The morphophonemic nasal in the prefixes below is neither regular nor predictable in the available data. It surfaces as a prenasalised stop and is thus irregularly restricted to roots that begin with stops. Some roots have variants both with and without the nasalisation.<sup>1</sup>

(17) <i>pa(N)-</i>	causative
<i>po-/pe(N)-</i>	valence increaser (adds an Actor or an Undergoer)
<i>ma(N)-</i>	stative
<i>me(N)-</i>	customarily, regularly, habitually
<i>ka(N)-</i>	nominaliser (instrument, result, location)
<i>sa(N)-</i>	singular occurrence of ROOT
(18) <i>mo-</i>	relativiser
<i>ko-</i>	have feature or quality of ROOT
<i>i-</i>	agentive passive
<i>to-</i>	agentless passive
<i>ti-</i>	accidental/agentless passive

Combinations of prefixes, and combinations of prefixes with suffixes are also found (see Anceaux 1952).

The verbal proclitic *be* comes before pronominal proclitics or verbal prefixes. It signals irrealis mood indicating what is contemplated, future,

1. It is entirely possible that the presence of the nasalisation is morphological, rather than phonological. Its presence may signal a difference in mood, such as the irrealis *-um-* allomorphy in the Muna language (cf. R. van den Berg 1991). More study is clearly required.

intention, or supposition. There are also predicate-level enclitics such as *-mo* ‘certain, completed, already’ and *-po* ‘uncertain, incomplete, still to come’.

Infixes are also found, but must be considered historically fossilised and unproductive. The nominal infix *-in-* is found in a few lexical items (e.g. *ka<sup>n</sup>de* ‘eat’, *k-in-a<sup>n</sup>de* ‘food’). The prefix *pino-* found on some kin terms is a combination of the prefix *po-* plus the infix *-in-*. The verbal infix *-um-* is recognisably found on only a few lexical items (e.g. *ta<sup>n</sup>da* ‘sign, omen’, *t-um-a<sup>n</sup>da* ‘appear unexpectedly’).

### 3.1 Reduplication

Reduplication in Wolio performs various functions. The broadest pattern is the reduplication of the first two syllables of the root.<sup>1</sup> Thus one gets the patterns of CVCV-CVCV, CVV-CVV, VCV-VCV, followed by additional syllables and suffixes.

Reduplication of some non-active verbs has a causative effect.

- |      |  |                      |
|------|--|----------------------|
| (19) | <i>ma-d’aki</i>                          | ‘be ugly, bad’       |
|      | <i>d’aki-d’aki</i>                       | ‘ruin s.th.’         |
| (20) | <i>ma-lape</i>                           | ‘good, fine, right’  |
|      | <i>lape-lape</i>                         | ‘to put s.th. right’ |
| (21) | <i>ma-ro<sup>m</sup>bu</i>               | ‘be dirty’           |
|      | <i>ro<sup>m</sup>bu-ro<sup>m</sup>bu</i> | ‘to soil s.th.’      |

Reduplication may have a diminutive or weakening (opposite of intensifying or emphatic) function.

- |      |                     |                                |
|------|---------------------|--------------------------------|
| (22) | <i>pooli</i>        | ‘to be better (a sick person)’ |
|      | <i>poo-pooli</i>    | ‘to be slightly better’        |
| (23) | <i>ma-pii</i>       | ‘be sick’                      |
|      | <i>ma-pii-pii</i>   | ‘be slightly sick’             |
| (24) | <i>ma-laja</i>      | ‘be tall’                      |
|      | <i>ma-laja-laja</i> | ‘be rather tall’               |
| (25) | <i>umala</i>        | ‘river’                        |
|      | <i>uma-umala</i>    | ‘stream, brook’                |
| (26) | <i>banua</i>        | ‘house’                        |
|      | <i>banu-banua</i>   | ‘small house’                  |

1. Bearing in mind that syllable structure types are restricted to CV and V, and that each vowel forms a syllable nucleus.

Reduplication may indicate plurality – with nouns indicating plurality of the referent and with verbs indicating a plurality of the action or of the result of the action, having a repetitive, iterative or distributive function.

- |      |   |                                      |
|------|---|--------------------------------------|
| (27) | <i>ma-katu</i>                                  | ‘break’                              |
|      | <i>a-ma-katu-katu</i>                           | ‘break into pieces’                  |
| (28) | <i>be<sup>n̄</sup>či</i>                        | ‘tear’                               |
|      | <i>a-be<sup>n̄</sup>či-be<sup>n̄</sup>či-mo</i> | ‘she tore it all up’                 |
| (29) | <i>patiu<sup>m</sup>ba</i>                      | ‘show s.th.’                         |
|      | <i>a-pati-patiu<sup>m</sup>ba</i>               | ‘he kept on showing s.th.’           |
| (30) | <i>ka<sup>m</sup>po</i>                         | ‘village’                            |
|      | <i>ka<sup>m</sup>po-ka<sup>m</sup>po</i>        | ‘villages’                           |
| (31) | <i>buso</i>                                     | ‘accumulate’                         |
|      | <i>buso-buso-ki</i>                             | ‘to gorge (stuff food in the mouth)’ |

#### 4. The phonemic status of the prenasalised stops

The prenasalised stops are all homorganic nasal + consonant. Unambiguous syllable structure in Wolio is CV and V. There are no unambiguous closed syllables. No other clusters occur, and as the homorganic nasal-consonant stops are found both root initially and intervocally they are analysed as unit phonemes rather than consonant sequences. There is contrast between the prenasalised stops and the regular stops.

- |      |                          |                                |
|------|--------------------------|--------------------------------|
| (32) | <i>didi</i>              | ‘food particles between teeth’ |
|      | <i>d<sup>i</sup>n̄di</i> | ‘roar (of storm)’              |
| (33) | <i>puu</i>               | ‘stem, trunk, base, source’    |
|      | <i><sup>m</sup>puu</i>   | ‘very, pure, genuine’          |

In other cases, however, the prenasalised stop appears to be in free variation with the normal stop, or else the semantic contrast is slight.

- |      |                          |                                |
|------|--------------------------|--------------------------------|
| (34) | <i>βete</i>              | ‘be satiated, full’            |
|      | <i>βe<sup>n̄</sup>te</i> | ‘distend, burst open’          |
| (35) | <i>βibi</i>              | ‘tremble, quake, shudder’      |
|      | <i>βi<sup>m</sup>bi</i>  | ‘strain, lift with difficulty’ |

It was noted above that prenasalised stops never occur as the epenthetic consonant in the suffixes *-(C)i*, *-(C)aka*, *-(C)a*. Furthermore, the prenasalised

stops do not appear to be reflexes of different historical consonants than the non-prenasalised stops.

However, prenasalisation can be shown to be predictable in certain environments due to morphological and morphophonemic processes, raising questions as to the phonemic status of the prenasalised stops. For example, in compounding, when the second root begins with a voiced or voiceless stop a homorganic nasal ligature *-N-* is inserted.

- |                                     |                     |               |
|-------------------------------------|---------------------|---------------|
| (36) <i>penami-<sup>ŋ</sup>kuku</i> | /penami-N-kuku/     | ‘nibble’      |
| <i>ulo-ulo-<sup>ŋ</sup>kobulu</i>   | /ulo-ulo-N-ko-bulu/ | ‘hairy heads’ |

With prefixes, however, the presence of prenasalisation cannot simply be analysed as morphophonemically conditioned ligature as in similar environments it is sometimes present and sometimes not.

- |                            |                         |
|----------------------------|-------------------------|
| (37) <i>ɓaa</i>            | ‘head’                  |
| <i>sa-<sup>m</sup>baa</i>  | ‘one head (classifier)’ |
| (38) <i>ɓara</i>           | ‘west monsoon’          |
| <i>sa-ɓara</i>             | ‘one year’              |
| (39) <i>kole</i>           | ‘sleep’                 |
| <i>me-<sup>ŋ</sup>kole</i> | ‘be a sleepy-head’      |

The presence or absence of prenasalisation often signals different semantic interpretation, suggesting it may be morphological, dealing with distinctions such as realis/irrealis, control, or orientation towards or away from actor. More study is clearly required.

- |   |                                    |
|---|------------------------------------|
| (40) <i>pa-kole</i>                         | ‘put to sleep’                     |
| <i>pa-<sup>ŋ</sup>kole</i>                  | ‘tend, nurse’                      |
| (41) <i>ɓale</i>                            | ‘rise, go up’                      |
| <i>ka-ɓale-ɓale</i>                         | ‘stand upright’                    |
| <i>ka-<sup>m</sup>ɓale-<sup>m</sup>ɓale</i> | ‘lie down (on one's back)’         |
| (42) <i>ka<sup>n</sup>de</i>                | ‘eat’                              |
| <i>me-ka<sup>n</sup>de</i>                  | ‘eat continuously’                 |
| <i>me-<sup>ŋ</sup>ka<sup>n</sup>de</i>      | ‘bite (as a fish nibbles at bait)’ |

## 5. Notes on the orthography

Some differences in orthographic conventions are noted below.

Table 4. Various orthographic conventions for Wolio

Anceaux 1952	Anceaux 1987	CAD
<i>q</i>	<i>ng</i>	<i>ŋ</i>
<i>b</i>	<i>b</i>	<i>β</i>
<i>d</i>	<i>d</i>	<i>d̥</i>

### 1. Introduction

---

Manggarai is spoken by some 400,000 speakers in western and north-central Flores Island in eastern Indonesia. It is classified as a Bima-Sumba language following Jonker (1896), which is said to group with the Central Malayo-Polynesian languages (see Blust 1978).

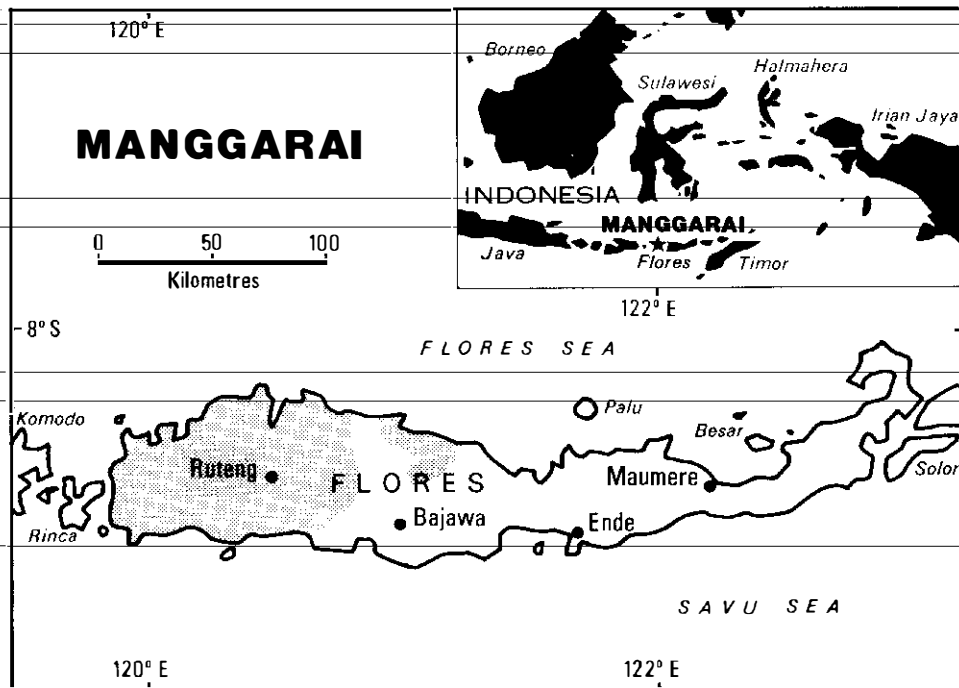

Approximately forty-three subdialects of Manggarai cluster into five recognisable dialect groupings: West Manggarai, West-central Manggarai, Central Manggarai, East Manggarai, and Far-east Manggarai. The latter is located in north-central Flores, separated from the other Manggarai dialects by the Rembong language. The CAD wordlist follows the Ruteng subdialect of Central Manggarai spoken in and around the town of Ruteng, the administrative capital of the region. Synonyms and variants listed in the notes are from other varieties of Central Manggarai, unless noted otherwise. Central Manggarai has around 300,000 speakers.

The most significant source of contact-induced language change has been from the Makassar language from south Sulawesi, under whose political and economic domination Manggarai existed until the mid-18th century. After 1727 Manggarai came under the domination of the Bima kingdoms from eastern Sumbawa to the west of Flores. The Dutch had no noticeable impact or presence in the area until 1907, resulting in only minor influences. After 1920, people in the Manggarai region shifted from their traditional beliefs and adopted Roman Catholicism. Along the west coast of Flores are several long-standing Bajau-speaking communities.

The Manggarai are culturally an inland-oriented agricultural people, rather than a sea-oriented people. This orientation is strongly reflected in their vocabulary as well as in their lifestyle and thought patterns.

- 
1. With this present contribution to the CAD, Father Verheijen continues a long tradition of documenting the Manggarai language which he has studied while living and working in the area since 1937.
-

Map 32. Manggarai language area

## 2. Phonology

### 2.1 Inventory of consonants

Table 1. Manggarai consonants

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>ɕ</i>	<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ʝ</i>	<i>g</i>	
Prenasalised stops	vl	<i><sup>m</sup>p</i>	<i><sup>n</sup>t</i>	<i><sup>n̄</sup>ɕ</i>	<i><sup>ŋ</sup>k</i>	
	vd	<i><sup>m</sup>b</i>	<i><sup>n</sup>d</i>	<i><sup>n̄</sup>ʝ</i>	<i><sup>ŋ</sup>g</i>	
Fricatives		<i>v</i>	<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Trills			<i>r</i>			
Semivowels			<i>y</i>			

The /v/ is a lightly fricativised voiced labio-dental fricative. A glottal stop is not indicated root-initially.

Although there are closed syllables root-finally, the presence of homorganic prenasalised stops root-initially forces the analysis of prenasalised stops as unit phonemes rather than as sequences of phonemes. Clusters (other than unit homorganic <sup>nasal</sup>consonant) do not occur, except morphologically with the addition of enclitics.

(1) Closed syllables

<i>ŋalor</i>	‘river’
<i>vulaŋ</i>	‘moon’
<i>varat</i>	‘storm’

(2) Initial prenasalised stops

<i><sup>n</sup>tala</i>	‘star’
<i><sup>n</sup>dili-<sup>n</sup>dəlap</i>	‘lightning’
<i><sup>n</sup>taŋis</i>	‘eagle’
<i><sup>m</sup>bərəs</i>	‘strong’

## 2.2 Inventory of vowels

Table 2. Manggarai vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>ɛ</i>	<i>ə</i>	<i>ɔ</i>
Low		<i>a</i>	

Monosyllabic lexical roots (i.e. non-functors and non-elitics) whose vowel is other than schwa /ə/ are phonetically long and are marked with a macron over the vowel in the wordlist.<sup>1</sup> Schwa occurs in both the ultimate and penultimate syllables of roots that have a medial consonant. Schwa does not occur in vowel sequences.

1. Alternatively these roots could be analysed as disyllabic roots containing sequences of like vowels.

### 2.3 Word stress

Words are stressed on the penultimate syllable of the root. If, however, the penultimate syllable contains a schwa /ə/ that is not followed by a prenasalised stop, then the ultimate syllable is stressed. The addition of enclitics does not effect the stress on the root.

(3)	['pitak]	'mud'	
	['vae]	'water'	
	['haŋju]	'tree'	< PMP * <i>kayu</i>
(4)	['lə <sup>n</sup> ko]	'valley'	
	['ə <sup>n</sup> de]	'mother'	
	['ə <sup>m</sup> po]	'grandchild'	< PMP * <i>u[m]pu</i>
(5)	[rə'vuŋ]	'cloud'	
	[ə'ma]	'father'	< PMP * <i>ama</i>

### 3. Morphology and morphophonemics

Table 3. Pronominal systems in Manggarai

	Free pronouns	●bject enclitics	Genitive enclitics
1sg	<i>aku</i>	- <i>k</i>	- <i>g</i>
2sg	<i>hau</i>	- <i>h</i>	- <i>m</i>
3sg	<i>hia</i>	- <i>i/y</i>	- <i>n</i>
1pl excl <sup>1</sup>	<i>ami</i>	- <i>km</i>	- <i>gm</i>
1pl incl	<i>ite</i>	- <i>t</i>	- <i>d</i>
2pl	<i>meu</i> <sup>2</sup>	- <i>m</i>	- <i>s</i>
3pl	<i>ise</i>	- <i>s</i>	- <i>d</i>

Manggarai has no productive derivational morphology (see Verheijen 1977).

Personal deixis is marked by different sets of pronouns and pronominal enclitics, that is, by free pronouns, object enclitics, and genitive enclitics. Free pronouns may be used as subject, as object, as object of a preposition, or in topicalisation constructions. Object enclitics mark the object of a transitive verb or the object of a preposition. The pronominal enclitics do

1. A dialectal variant of *ami* is *hami*. As enclitics the forms *-km/-gm* do not participate in or shift patterns of word stress and could be seen as *-kəm/-gəm* respectively (remembering that schwa is phonetically short and unstressed).

2. West Manggarai uses *hemi*, rather than *meu*.

not effect word stress of the roots to which they attach.<sup>1</sup> The genitive enclitics mark a tight semantic association between referents (e.g. ‘my father’) or a possessive relationship (e.g. ‘my knife’).

### 3.1 Homorganic nasal ligature

Occasionally one finds the insertion of a homorganic nasal ligature *-N-* before stops in compounds.

(6)	<i>pulu</i>		‘ten (in counting)’
	<i>čə-pulu</i> ~ <i>čə<sup>m</sup>pulu</i>		‘ten (numeral, lit. one-ten)’
(7)	<i>sua</i>		‘two’
	<i>ata sua</i>		‘second’
	<i>sua-<sup>n</sup>kali</i>	/sua-N-kali/	‘two times’
	<i>sua-<sup>m</sup>pulu</i>	/sua-N-pulu/	‘twenty’
(8)	<i>atatəlu</i>		‘third’
	<i>təlu-<sup>n</sup>kali</i>	/təlu-N-kali/	‘three times’

### 3.2 Vowel reduction (centralisation)

The vowels of prepenultimate proclitics are often reduced to schwa /ə/.

(9)	<i>čā</i>		‘one’
	<i>čə</i>		‘one (of something)’
	<i>čə-pulu</i> ~ <i>čə<sup>m</sup>pulu</i>		‘ten’
(10)	<i>ŋə<sup>n</sup>tauŋ</i>	/ŋai- <sup>n</sup> tauŋ/	‘always’

### 3.3 Vowel deletion (contraction)

In some cases there is a deletion of the vowel(s) of proclitic functors before vowel-initial roots.

(11)	<i>l-aku</i>	←	/ləaku/	‘by me’
(12)	<i>s-o<sup>o</sup>o</i>	←	/ise o <sup>o</sup> o/	‘these (lit. they here)’
(13)	<i>d-anak</i>	←	/dəanak/	‘of the child’

1. The enclitics attach to consonants as well as vowels. Analysis of the resulting clusters could optionally consider the presence of an epenthetic schwa (e.g. *anak-n* [‘anak-ən] ‘child-3s’, *bora-n* ‘rich-3s’).

### 3.4 Reduplication

The forms of reduplication in Manggarai are many (see Verheijen 1948).

Phrasal repetition may signal habitual occurrence.

(14) *čaŋtəgi, čaŋtəgi* ‘he’s always early’

Reduplication on the stem, however, may be reduplication of the full root, CVCV-reduplication, CV-reduplication, or, with vowel reduction, Cə-reduplication. All three forms of reduplication may be found as variants on the same root.

*Table 4.* Forms of reduplication in Manggarai

Full root	CVCV-Redup	CV-Redup	Cə-Redup	Gloss
<i>tuʔuŋ-tuʔuŋ</i>	<i>tuʔu-tuʔuŋ</i>	<i>tu-tuʔuŋ</i>	<i>tə-tuʔuŋ</i>	‘truly, certainly’
<i>diʔa-diʔa</i>		<i>di-diʔa</i>	<i>də-diʔa</i>	‘good, beautiful’
<i>čai-čai</i>			<i>čə-čai</i>	‘have come’
<i>taʔoŋ-taʔoŋ</i>	<i>taʔo-taʔoŋ</i>		<i>tə-taʔoŋ</i>	‘endure, withstand’
<i>toʔo-toʔo</i>		<i>to-toʔo</i>	<i>tə-toʔo</i>	‘stand up’

Manggarai also has a form of complex reduplication with CVCV-reduplication followed by Cə-reduplication of the root. Complex reduplication marks a descriptive feature or quality of the referent.

(15) *li<sup>m</sup>pə-lə-li<sup>m</sup>pə* ‘flat-nosed’  
*vəŋa-və-vəŋa* ‘hare-lipped’

A further form of reduplication in Manggarai like CV(C)V-reduplication has the constraint that the vowels must be /a/ and /i/ respectively (i.e. *Ca(C)i*-reduplication).

(16) *aʃi-eʃor* ‘wander about’  
*hai-haor* ‘mix’  
*hai-heor* ‘stir’  
*hai-hoal* ‘tilt up’  
*api-apa* ‘what?’ (emphatic)

## 4. Notes on orthographies

---

### 1. Introduction

---

The Ngada<sup>1</sup> language is spoken by 60,000 - 70,000 people on the west-central part of the island of Flores in eastern Indonesia. Ngada is assumed to belong to the Bima-Sumba group, following Jonker (1896). The main dialects of Ngada are: *Soa, Central, Bajava, Southeast, and Southwest*. The CAD wordlist presents data from the *Bajava* dialect spoken in the town of Bajava and surrounding communities.

There is a large corpus of oral literature, primarily in the forms of folklore, proverbs and traditional sayings which are invoked during disputes, ritual occasions and ceremonies, used for instruction, for stressing a point, or for lending authority to a point made in settling a dispute.

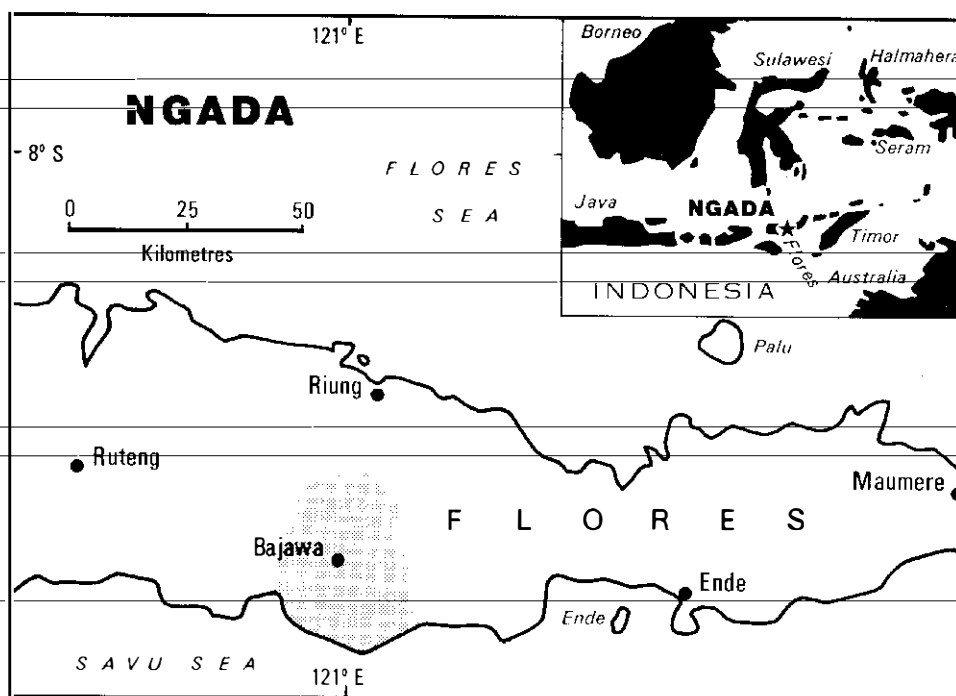

In addition to publishing extensive ethnographic studies on the Ngada people, the Catholic missionary Paul Arndt also published a grammar sketch (1933), a collection of myths with German translations (1960), and a Ngada-German dictionary of around 10,000 entries complete with illustrative sentences (1961). Djawanai, a native speaker of Ngada, has published a brief phonology (1977), notes on Ngada personal deixis in discourse (1978), and an analysis of texts, including a sketch of the phonology and grammar (1983). Moore (1980) provides a sketch of the phonology.

---

1. We follow here the government spelling for the Regency in which the language is spoken. Alternate spellings found in the literature used to signal the implosive are *Ngadha, Nad'a, Ngad'a, and Nga'da*. The language is also known as Bajava after the administrative capital of the area.

---

Map 33. Ngada language area

## 2. Phonology

### 2.1 Inventory of consonants

Table 1. Ngada consonants

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>		<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ɟ</i>	<i>g</i>	
Implosives		<i>ɓ</i>	<i>ɗ</i>			
Fricatives	vl	<i>f</i>	<i>s</i>			<i>h</i>
	vd	<i>v</i>	<i>z</i>		<i>ɣ</i>	
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Taps			<i>r</i>			
Laterals			<i>l</i>			

Voiceless stops are strongly aspirated in initial position. There is slight preaspiration and aspiration intervocally, particularly with apical /t/ and

dorsal /k/. Apical /d/ is dental, implosive /ɗ/ is retroflexed,<sup>1</sup> and the other apicals are alveolar. Implosive /ɓ/ word-initially is often voiceless if the medial consonant is also an implosive. Labials /v f/ are labio-dental. Fricative /h/ tends toward [x] before high vowels. /r/ is a tap intervocally, except in emphatic speech or following schwa /ə/, in which cases it is often articulated as a trill. Glottal /ʔ/ is in contrast with its absence word initially. Medially, however, between like vowels in rapid speech the glottal tends to be dropped, often creating homophones with words that have geminate vowel sequences.

- |     |        |   |       |                       |
|-----|--------|---|-------|-----------------------|
| (1) | /boʔo/ | ~ | [boo] | ‘full (after eating)’ |
|     | /boo/  |   |       | ‘blister, granary’    |
| (2) | /puʔu/ | ~ | [puu] | ‘base, source’        |
|     | /puu/  |   |       | ‘tall grass’          |
| (3) | /paʔa/ | ~ | [paa] | ‘thigh’               |
|     | /paa/  |   |       | ‘distribute’          |

## 2.2 Inventory of vowels

Table 2. Ngada vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

Between voiceless consonants, and following voiceless consonants phrase-finally, vowels may also be voiceless.

Unambiguous syllable types are CV and V. Vowel sequences, whether a sequence of like vowels or unlike vowels, cross syllable boundaries and are not unitary diphthongs. An epenthetic [y] may occur between unlike vowels in which the first vowel of a vowel sequence is front. An epenthetic [w] may occur between unlike vowels in which the first vowel of a vowel sequence is back. Schwa /ə/ never occurs in vowel sequences.

1 Djawanai (1983: 114) describes this sound as retroflexed, while the 1977 article (1977: 10) describes it as an “alveo-palatal (retroflex)”. It may group as a laminal.

The schwa /ə/ is of short duration and phonetically lengthens the following consonant. Schwa never occurs in the ultimate syllable of disyllabic or trisyllabic lexical roots. Root-initial schwa is deleted leaving only the trace lengthening of the following consonant.

(4)	/əma/	→	[mma]	'father'	< PMP *ama	'father'
	/əna/	→	[nna]	'sand'	< PMP *qenay	'sand'
	/əbu/	→	[bbu]	'grandparent'	< PMP *u[m]pu	'grandparent'

### 2.3 Stress

Word stress falls on the penultimate syllable of lexical roots. If the penultimate syllable contains a schwa /ə/, stress falls on the ultimate syllable. Stress is indicated by a lengthening of the vowel and slightly higher pitch. Monosyllabic functors and clitics do not carry their own word stress, but behave as satellites to stress-bearing lexical roots.

### 2.4 Vowel reduction (centralisation)

In certain environments there is a centralisation of other vowels to schwa [ə]. The vowel of monosyllabic functors is often reduced to schwa.

(5)	<i>mu</i>	[mə]	marker of contrastive emphasis
	<i>sa-</i>	[sə]	one (bound morpheme)
	<i>da</i>	[də]	realis marker
	<i>lə</i>	[lə]	adverb of manner

Such vowel reduction often operates across morpheme boundaries, triggering the lengthening of the following consonant in the process.

(6)	<i>ba ŋa</i>	→	[bəŋŋa]	( <i>ba</i> 'CONN', <i>ŋa</i> 'thematic particle')
	<i>vi ŋa</i>	→	[vəŋŋa]	( <i>vi</i> 'infinitive marker/complementiser')

The vowel /a/ in the penultimate syllable of lexical roots, preceded or followed by dorsal /ŋ/ or /g/ tends to reduce to schwa and trigger lengthening of the following consonant.

(7)	<i>ŋata</i>	→	[ŋətta]	third person thematic pronoun
	<i>gazi</i>	→	[gəzzi]	third person oblique pronoun

### 3. Notes on morphology and syntax

Personal deixis in Ngada is complex, often using kin terms, titles, descriptive phrases, or spatial deictics, rather than personal pronouns. Plural forms of pronouns may be used honorifically for singular referents as well. Free pronouns may be used in all contexts. That is, they may indicate the preverbal core argument (subject) marking the subject of either transitive or intransitive verbs, the post-verbal core argument (object), the object of prepositions, and they may be used in topicalisation constructions. Oblique pronouns, when they are used, are restricted to marking the object of transitive verbs, the object of prepositions, or to signalling a possessive relationship as the object of the possessive clitic *go* ‘of’.

*Table 3.* Pronominal systems in Ngada

	Free pronouns	Oblique pronouns
1sg	<i>ʃaʔo</i> <sup>1</sup>	<i>naʔo</i>
2sg	<i>kaü</i>	<i>gäü</i>
3sg	<i>kazi</i> <sup>2</sup>	<i>gazi</i>
1pl excl	<i>kami</i>	<i>gami</i>
1pl incl	<i>kita</i>	<i>gita</i>
2pl	<i>miu</i>	<i>miu</i>
3pl	<i>emu</i> <sup>3</sup>	<i>emu</i>

There are two constructions used to indicate a possessive-like association between two referents. The first is the possessive construction using the possessive clitic *go* followed by the appropriate pronoun. The second is the genitive construction marked by simple juxtaposition of the possessed item followed by the free form of the pronoun.

- (8) *sosa go gazi*                      ‘his/her fish trap’  
*sosa kazi*                                ‘his/her fish trap’

For third person pronouns, in addition to the use of kin terms, titles, etc. already referred to above, there are several other choices. *Voʔe* and *noʔe* may substitute for *kazi* and *gazi* respectively. *Ata* ‘3sg’ and *rivu* ‘3pl’ or *voe*

1. A dialectal variant of *ʃaʔo* is *zaʔo*.
2. Dialectal variants of *kazi* are *kaji* and *kari*.
3. Dialectal variants for *emu* are *demu*, *ilo* and *siza*.

'3pl' are used to indicate indefinite (specific or non-specific) referents as in 'somebody', 'they', 'people'. The form *ŋata* (from *ŋa* + *ata*) is used for third person (singular or plural) as a thematic pronoun signalling pragmatic focus. The form *laki* '3sg' and *emu-laki* '3pl' are sympathetic pronouns implying the speaker's sympathetic or compassionate feelings toward the referent due to the unfortunate state or condition of the referent. The form *ana-ŋata* '3pl' is also used as a sympathetic pronoun. The term *hoga* (with dialectal variant *soga*) literally means 'young man', but is occasionally used as a third plural pronoun either with or without the plural *emu-*.

Spatial/temporal deictics may also be used in place of personal pronouns to track a referent in discourse.

(9)	<i>di/dia</i>	'this/here/now (near the speaker)'
	<i>dau</i>	'that/there/now (near the addressee)'
	<i>kəna</i>	'that/there/then (far from both speaker and hearer)'

Ngada does not use morphological mechanisms for marking such things as aspect and mood on verbs, but rather auxiliaries which may be either monosyllabic clitics, or disyllabic roots.

#### 4. Notes on orthography

Table 4. Various orthographic conventions for Ngada

Arndt 1933	Arndt 1961	Djawanai 1977	Djawanai 1983	CAD
<i>ng</i>	<i>ng</i>	<i>ng</i>	<i>ng</i>	<i>ŋ</i>
<i>ɸ'</i>	<i>bh</i>	<i>ɸ</i>	<i>bh</i>	<i>ɸ</i>
<i>d'</i>	<i>dh</i>	<i>d</i>	<i>dh</i>	<i>d'</i>
<i>y</i>	<i>y</i>	<i>gh</i>	<i>gh</i>	<i>ɣ</i>
<i>dz</i>	<i>dz</i>	<i>j</i>	<i>j</i>	<i>ǰ</i>
<i>x</i>	<i>x</i>	<i>x</i>	<i>h</i>	<i>h</i>
<i>c</i>	<i>é</i>	<i>e</i>	<i>e</i>	<i>e</i>
<i>č</i>	<i>e</i>	<i>ə</i>	<i>c</i> + doubled C	<i>ə</i>
<i>c</i> <sup>1</sup>	<i>c</i>	—	—	—
— <sup>2</sup>	—	?	,	?

1. Instead of indicating a glottal Arndt indicated its absence. Thus the /c/ indicated no glottal closure (e.g. *cemu* for *emu*, and *dica* for *dia*).
2. Arndt indicated intervocalic glottal with a diaeresis over the second vowel (e.g. *zaö* for *zaʔo*).

## 34. Sika

---

---

<b>Contributors:</b>	
<b>Introduction:</b>	<i>E. D. Lewis – Charles E. Grimes</i>
<b>Wordlist:</b>	<i>E. D. Lewis</i>

---

### 1. Introduction

---

Sika (also Sikka, Sara Sikka<sup>1</sup>) is spoken by approximately 175,000 people in the administrative regency of Sikka in eastern Flores in eastern Indonesia. There is a consensus among scholars that assumes Sika should be classified generally with those Austronesian languages currently referred to as “Central Malayo-Polynesian”, and specifically with the Flores-Lembata languages (see Wurm – Hattori 1983).

While the speech varieties of Sika are yet to be the target of careful dialect study, it is convenient to recognise at least three main dialects. *Sikka Natar* is spoken by people in the village with the same name and in surrounding communities extending to Bola in the east, Lela in the west and Nita inland to the north. Sikka Natar (*natar* ‘village’) is located on the south coast and was, until 1954, the home of a royal dynasty whose rajas ruled this part of Flores from at least the mid-sixteenth century until Indonesian independence. Sara Sikka Natar (‘the language of the village of Sikka’) is generally perceived in the region to be the most refined and most prestigious of the Sika speech varieties [abbreviated SSN in the word list].

The second dialect, *Sara Krowe* is spoken in the central hills of the Sika speaking area. An alternate name for people living in the central hills is *ata’iβaŋ* ‘hill people’.

The *Tana ’Ai* region includes the mountainous eastern part of the Sika speaking area. The terms *Ata Tana ’Ai* and *Sara Tana ’Ai* are used by both insiders and outsiders to refer respectively to the people and the language of the region. The ethno-linguistic identity of the *Ata Tana ’Ai* easily

---

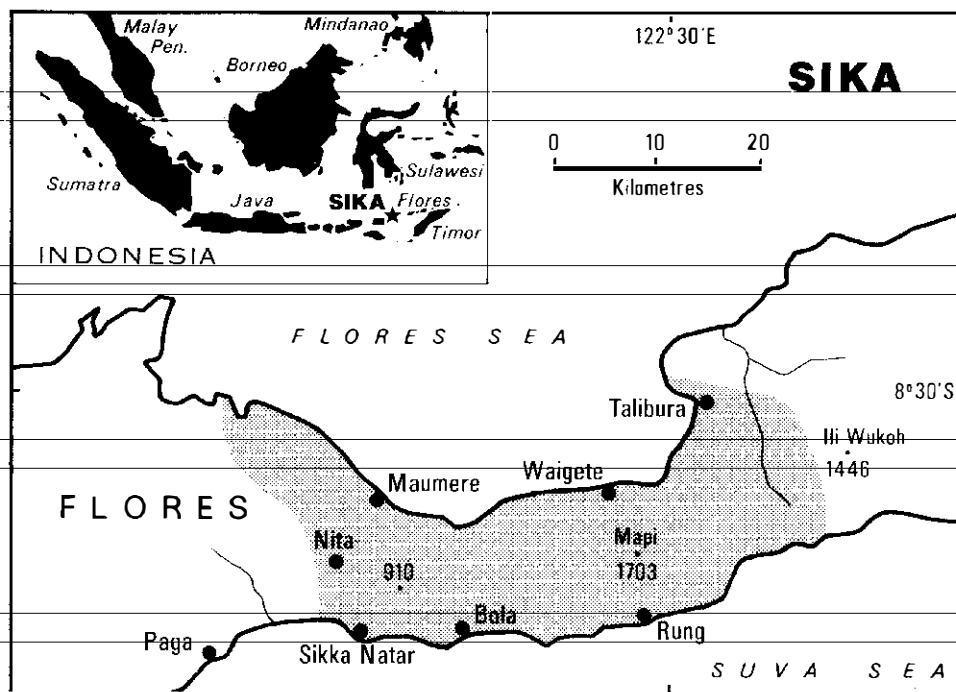

1. The double *k* is used in many sources for spelling both the place name and the language name but does not represent any phonetic reality in the language itself. Arndt (1931) refers to the language as “Sika”. Conventions using “Sikka” follow the official spelling for the regency and town by that name, hence both spellings occur in this article. *Sara* means ‘way, language’.

---

distinguishes them from people of other areas. There are approximately 9,800 speakers of Sara Tana 'Ai. It is this Tana 'Ai dialect that is used in the wordlist.<sup>1</sup>

The Ata Tana 'Ai also have specialists who use a poetic register of ritual speech to recount the mythic origins of the Tana 'Ai domains, the histories of clans, and with which they communicate with the deity and ancestors of the domains on ritual and ceremonial occasions. In common with other ritual languages of eastern Indonesia (see Fox 1988), Tana 'Ai ritual language is marked by semantic parallelism, elided syntax, and a pattern of four-word sequences doubled into couplets (see Lewis 1982, 1988a, 1988b). The paired words found in the semantic dyads of ritual language most frequently use words of common Sara Tana 'Ai, but sometimes a Tana 'Ai word is paired with a word from the Lamaholot language of east Flores.

Map 34. Sika language area

1. The word list is based on notes on the lexicon by E.D. Lewis made in the course of ethnographic fieldwork in Sikka Natar and Tana 'Ai during almost five years since 1977. Research from 1977 to 1979 was carried out under the auspices of LIPI (Lembaga Ilmu Pengetahuan Indonesia) and in 1980 under the sponsorship of the Pusat Pembinaan dan Pengembangan Bahasa. Lewis is compiling a dictionary of Sika.

Brief wordlists of Sika were published toward the end of the last century by Calon (1890-1891, 1893, 1897). Jonker (various) has Sika data scattered throughout his writings. Arndt (1931) published a sketch grammar of Sika which remains the most significant study of the language itself accessible to the broader scholarly public. Soge (1979), a native speaker of Sika, has done a more recent study on Sika language structures. An unpublished manuscript of a Sika-Dutch glossary by Meyer (n.d.) has been in use by Catholic missionaries and priests on Flores for several decades.

## 2. Phonology

### 2.1 Inventory of consonants

The /β/ is a lightly fricativised voiced bilabial fricative. Laminal /ʃ/ is a voiced alveo-palatal affricate. Borrowed phonemes /f ñ y/ have been assimilated into Sika from sources such as Malay and Arabic.

Table 1. Sika consonant/phonemes

		Labial	Apical	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>		<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ʃ</i>	<i>g</i>	
Fricatives		<i>β</i>	<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Trills			<i>r</i>			
Laterals			<i>l</i>			

There are dialectal variants in the distribution of some phonemes. In the Tana 'Ai dialect, dorsal /ŋ/ and apical /n/ are neutralised as apical /n/ word-finally, except in some monosyllabic words of the shape *CVŋ*. The contrast remains in the Sikka Natar dialect. There are dialectal variants with /s/ and /h/ (e.g. *sa/ha* 'one').

Consonant clusters occur in recent loans and word initially in some inherited words. Labial stops /p b/ and dorsal stops /k g/ all cluster with following trill /r/ and lateral /l/. Some of these frozen clusters, however, probably reflect a historical morphological process.

- (1) *roʔo* 'space'  
*groʔo* 'near'

Initial homorganic prenasalised stops /<sup>m</sup>p <sup>n</sup>d <sup>ŋ</sup>g/ are found in only a handful of words in the entire lexicon and are assumed to be loans from nearby languages such as Lio.

Initial glottal /ʔ/ followed by /β r l/ is the result of morphological inflection for first person singular on verbs (discussed in more detail below).

## 2.2 Inventory of vowels

*Table 2. Sika vowels*

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

Syllables with schwa /ə/ as their peak are of shorter duration than syllables with /e/ as their peak. Schwa occurs in ultimate as well as penultimate syllables.

Non-geminate vowel sequences occur for all combinations of the five vowels /i e a o u/. Glottal insertion occurs between geminate vowel sequences of the five vowels /i e a o u/. The vowel /ə/ occurs only rarely in non-geminate vowel sequences.

## 2.3 Word stress

Word stress falls on the penultimate syllable of lexical roots. However, if the penultimate syllable contains a schwa, then stress falls on the ultimate syllable. Stress is indicated by a slight lengthening of the vowel and a slight increase in pitch. Stress does not shift on the root with the addition of enclitics.

## 3. Morphology and morphophonemics

Personal deixis in Sika is complex. Kin terms and titles are often used in place of personal pronouns. Free pronouns may be used to indicate subject, object, object of the preposition, or in topicalisation constructions. Possessive pronouns are formed adding *-ŋ*, *-n*, or *-t* to the end of the free pronoun (e.g. *aʔu-ŋ*, *aʔu-t* '1sgPOSS'). Subject prefixes index person and number combinations on the verb. The particular form taken by the subject

prefixes is conditioned by syllable structure and phonotactic constraints. Free pronouns are generally required to disambiguate the referents.

Table 3. Sika personal deixis before morphophonemic conditioning

	Free pronouns	Subject prefixes before vowels	Subject prefixes before consonants
1sg	<i>aʔu</i>	<i>ʔ-</i>	<i>ʔ-</i>
2sg	<i>ʔau</i>	<i>m-</i>	[+voice]
3sg	<i>nimu</i>	<i>n-</i>	[+voice]
1pl excl	<i>ʔami</i>	<i>m-</i>	[+voice]
1pl incl	<i>ʔita</i>	<i>t-</i>	∅
2pl	<i>miu</i>	<i>m-</i>	[+voice]
3pl	<i>inuu</i>	<i>ɾ-/ɿ-</i>	∅

Table 4. Subject prefixes before vowels

	'drink' <i>-inu</i> (PMP * <i>inum</i> )	'plait, weave' <i>-ana</i> (PMP * <i>añam</i> )	'take, carry' <i>-ala</i> (PMP * <i>alap</i> )	'sweep' <i>-oni</i>
1sg	<i>ʔ-inu</i>	<i>ʔ-ana</i>	<i>ʔ-ala</i>	<i>ʔ-oni</i>
2sg	<i>m-inu</i>	<i>m-ana</i>	<i>m-ala</i>	<i>m-oni</i>
3sg	<i>n-inu</i>	<i>n-ana</i>	<i>n-ala</i>	<i>n-oni</i>
1pl excl	<i>m-inu</i>	<i>m-ana</i>	<i>m-ala</i>	<i>m-oni</i>
1pl incl	<i>t-inu</i>	<i>t-ana</i>	<i>t-ala</i>	<i>t-oni</i>
2pl	<i>m-inu</i>	<i>m-ana</i>	<i>m-ala</i>	<i>m-oni</i>
3pl	<i>r-inu</i>	<i>r-ana</i>	<i>l-ala</i>	<i>r-oni</i>

Vowel-initial roots take the paradigm listed above. Some roots take *l-* rather than *r-* to index 3pl, possibly due to consonant harmony.

With consonant-initial roots, several processes come into play that are illustrated in the figure below. First person singular is marked with a preceding glottal. However, with roots beginning with voiceless stops /p t k ʔ/, the 1sg glottal morpheme coalesces with the initial consonant of the root. The forms for 1pl incl and 3pl are the unmarked root. The other forms (2sg, 3sg, 1pl excl, 2pl) assimilate to their associated voiced stop for roots beginning with /p t ʔ β/. Glottal-initial roots (< PMP \**k*) go to /g/, while

fricative /β/ goes to /b/. For roots that begin with consonants that are voiced (e.g. /r l/), only the first singular form is marked.

*Table 5.* Subject prefixes before consonants

	'go, walk'	'plant s.th.'	'chop s.th.'	'cry, weep'	'call'	'see'
PMP	<i>*panaw</i>			<i>*taŋis</i>		<i>*kita</i>
	<i>pano</i>	<i>paʔat</i>	<i>pati</i>	<i>tani</i>	<i>topo</i>	<i>ʔita</i>
1sg	<i>pano</i>	<i>paʔat</i>	<i>pati</i>	<i>tani</i>	<i>topo</i>	<i>ʔita</i>
2sg	<i>bano</i>	<i>baʔat</i>	<i>bati</i>	<i>dani</i>	<i>dopo</i>	<i>gita</i>
3sg	<i>bano</i>	<i>baʔat</i>	<i>bati</i>	<i>dani</i>	<i>dopo</i>	<i>gita</i>
1pl excl	<i>bano</i>	<i>baʔat</i>	<i>bati</i>	<i>dani</i>	<i>dopo</i>	<i>gita</i>
1pl incl	<i>pano</i>	<i>paʔat</i>	<i>pati</i>	<i>tani</i>	<i>topo</i>	<i>ʔita</i>
2pl	<i>bano</i>	<i>baʔat</i>	<i>bati</i>	<i>dani</i>	<i>dopo</i>	<i>gita</i>
3pl	<i>pano</i>	<i>paʔat</i>	<i>pati</i>	<i>tani</i>	<i>topo</i>	<i>ʔita</i>

	'embrace'	'bite'	'fall'	'raise up'	'visit'	'sew'	'catch'
PMP		<i>*kitkit</i>			<i>*lakaw</i>	<i>*zaqit</i>	<i>*dakcp</i>
	<i>ʔapu</i>	<i>ʔiʔi</i>	<i>ʔ-βatu</i>	<i>ʔ-βake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>
1sg	<i>ʔapu</i>	<i>ʔiʔi</i>	<i>ʔ-βatu</i>	<i>ʔ-βake</i>	<i>ʔ-lako</i>	<i>ʔ-raʔit</i>	<i>ʔ-raʔa</i>
2sg	<i>gapu</i>	<i>giʔi</i>	<i>batu</i>	<i>bake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>
3sg	<i>gapu</i>	<i>giʔi</i>	<i>batu</i>	<i>bake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>
1pl excl	<i>gapu</i>	<i>giʔi</i>	<i>batu</i>	<i>bake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>
1pl incl	<i>ʔapu</i>	<i>ʔiʔi</i>	<i>βatu</i>	<i>βake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>
2pl	<i>gapu</i>	<i>giʔi</i>	<i>batu</i>	<i>bake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>
3pl	<i>ʔapu</i>	<i>ʔiʔi</i>	<i>βatu</i>	<i>βake</i>	<i>lako</i>	<i>raʔit</i>	<i>raʔa</i>

The verb 'to eat' follows the regular pattern for glottal initial roots for the consonant, but exhibits seemingly irregular vowel shifts.<sup>1</sup>

1. The shift to /o/ in the 1sg form probably reflects a retention of the vowel of the historical *\*ku-* > *ʔo-* > *ʔ-*.

Table 6. Sika irregular verb ‘to eat’

	‘eat’
	?ea
1sg	?oa
2sg	gea
3sg	gā
1pl excl	gea
1pl incl	?ea
2pl	gea
3pl	?a

### 3.1 Genitive endings /-n -ŋ -t/

While there is occasional evidence of an earlier system of genitive enclitics inflected for person (e.g. *ama-m* ‘father-2sg’), the productive system currently is reduced to three forms /-n -ŋ -t/. The forms are often interchangeable and the functional difference between them remains unclear. The genitive endings may be suffixed to the free pronouns to form the possessive pronouns.

Table 7. Sika possessive pronouns

	Free pronoun	Possessive pronoun with /-n/	Possessive pronoun with /-ŋ/	Possessive pronoun with /-t/
1sg	a?u	a?u-n	a?u-ŋ	a?u-t
2sg	?au	?au-n	?au-ŋ	?au-t
3sg	nimu	nimu-n	nimu-ŋ	nimu-t
1pl excl	?ami	?ami-n	?ami-ŋ	?ami-t
1pl incl	?ita	?ita-n	?ita-ŋ	?ita-t
2pl	miu	miu-n	miu-ŋ	miu-t
3pl	rimu	rimu-n	rimu-ŋ	rimu-t

The genitive endings may be used in either of two different orderings of a genitive or possessive construction.

- (2) *matanimu-n* 'his eye (eye 3sg-GEN)'  
*nimumata-ŋ* 'his eye (3sg eye-GEN)'<sup>1</sup>

Personal nouns (such as people's names) never directly take a genitive ending. Thus, when a proper name is involved, only the second of the two constructions is used to indicate a genitive relationship.

- (3) *Rapa mu?u-n* 'Rapa's bananas (Rapa banana-GEN)'  
*Lodannara-t* 'Lodan's brother (Lodan brother-GEN)'  
*Kletus ba?i-t* 'Kletus' foot (Kletus foot-GEN)'

The /-n/ may be used in a participial construction to indicate a verb is being used attributively within the noun phrase.

- (4) *Nimu hena telo.* 'She boils [an] egg.'  
*Nimu ga telo hena-n.* 'She eats a boiled egg.'

#### 4. Notes on orthography

Table 8. Some orthographic conventions for Sika

Arndt 1931	Lewis 1988b	CAD
<i>n̄ŋ</i>	<i>n̄ŋ</i>	<i>n̄</i>
<i>w</i>	<i>w</i>	<i>β</i>
<i>lh</i>	<i>ʔ</i>	<i>ʔl</i>
<i>mh</i>	<i>ʔm</i>	<i>ʔm</i>
<i>nh</i>	<i>ʔn</i>	<i>ʔn</i>
<i>rh</i>	<i>ʔr</i>	<i>ʔr</i>
<i>wh</i>	<i>ʔw</i>	<i>ʔβ</i>
<i>dz</i>	<i>j</i>	<i>ʃ</i>
<i>é</i>	<i>é</i>	<i>e</i>
<i>e</i>	<i>e, è</i>	<i>ɔ</i>
<i>c</i> <sup>2</sup>	—	—
<i>_3</i>	<i>,</i>	<i>ʔ</i>

1. The latter construction could be interpreted predicatively 'He is eyed.'

2. Instead of indicating a glottal Arndt indicated its absence. Thus the /c/ indicated no glottal closure (e.g. *cinang* for *ina-ŋ* 'mother-GEN', and *micung* for *miu-ŋ* '2pl-GEN').

3. Arndt indicated intervocalic glottal with a diaeresis over the second vowel (e.g. *laiʔi* for *laʔi* 'male').

Wordlist: <i>James J. Fox</i>
-------------------------------

---

---

### I. Introduction

---

---

Rotinese is spoken on the island of Roti (Rote) off the southwest tip of Timor and on settlements on the neighbouring islands of Semau and Timor. Speakers of Roti occupy the northwestern corner of Timor, the areas in and around the town of Kupang, the plain of Oesau, various locations along a narrow band on the north coast and on the main road well into the interior of West Timor. The number of speakers is currently well over 120,000.

Rotinese is one of the most thoroughly studied languages in Indonesia. Initial accounts of Rotinese were all produced by Roti schoolteachers toward the end of the nineteenth century and were published in the *Bijdragen tot de Taal-, Land- en Volkenkunde*. The earliest account of the Roti language was written by D. P. Manafe (1889); this account concentrates on dialect differences on the island. It was followed by a short Rotinese-Malay wordlist by Pello (1890); and then by a succinct but creditable grammatical sketch of Rotinese by J. Fanggidaej (1892). Other tables, texts and wordlists are listed in Fox (1974). There is also a Rotinese translation of the Gospel of Luke (Fanggidaej 1895).

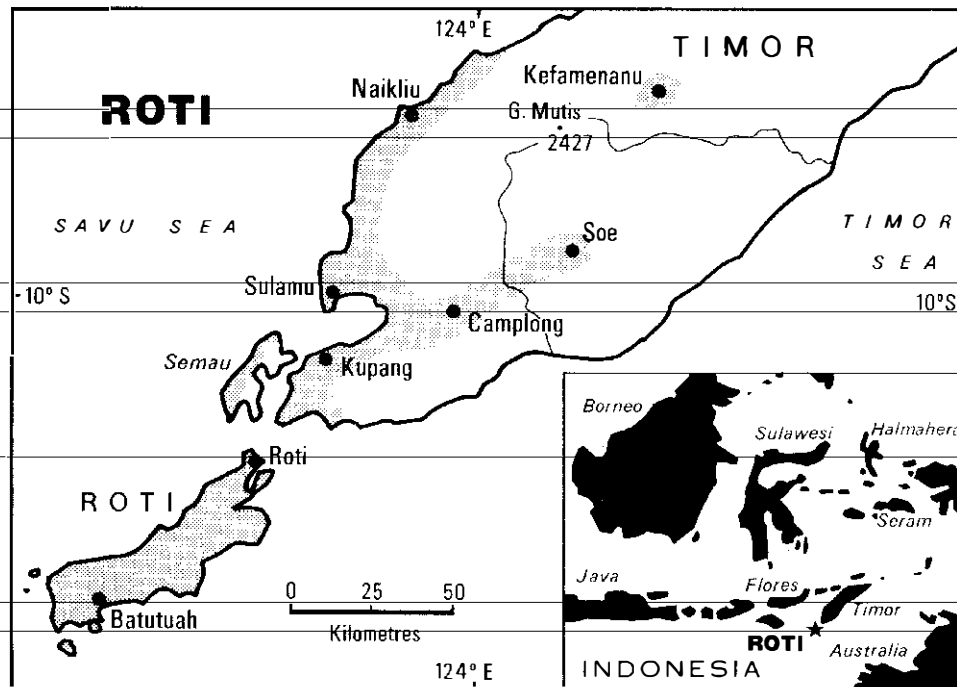

The major study of Rotinese was carried out by the Dutch linguist, J. C. G. Jonker, whose explicit intention was to produce an exemplary study of Roti as the fullest possible description of any Malayo-Polynesian language. To this end, Jonker published a collection of Roti tales with Dutch translations (1905) and then a Roti-Dutch dictionary of over 800 pages (1908). This dictionary was followed by a volume of additional Rotinese texts with Dutch translations (1911) and a collection of Rotinese texts in different dialects, again with Dutch translations (1913). Jonker's grand opus culminated in a massive seven hundred page grammar of Rotinese (1915).

Neither Jonker's dictionary nor his grammar is, in any conventional sense, the study of a single language. Jonker used both of these works to advance comparative observations on an extensive array of other Austronesian

---

---

languages.<sup>1</sup> His desire to be comprehensive, exhaustive and at the same time comparative resulted in studies that present formidable obstacles to a simple comprehension of the basic structures of Rotinese.

Map 35. Roti language area

In Jonker's entire corpus of texts, there is only one text in Rotinese ritual language, the special poetic speech register used extensively by the Rotinese in situations of formal interaction. Jonker annotated this one text but left it untranslated, indicating that ritual language was for him a subject of some obscurity. Since Jonker's time, the study of Rotinese ritual language has been taken up by the author of this section, who has published a number of studies, each with an illustrative text or texts (Fox 1971, 1974, 1975, 1982, 1983, 1988.) An as yet incomplete dictionary (Fox 1972a) with an accompanying volume of texts (Fox 1972b) exists for this ritual language.

The sociolinguistic situation of Rotinese is sketched in Fox (1975). Rotinese consists of a chain of dialects running from east to west on the

1. Jonker himself produced grammars and dictionaries of Bima, Sawu, Roti, and Leti. In addition he did descriptive work on Ndao, Kupang (Helong), Ende, Manggarai, "Timor" and Alor. His comparative work draws on data from languages in such diverse areas as Ambon, Buru, Sulawesi, Nusatenggara, Java, and Sumatra, Philippines, and eastern Oceania. Comments are sprinkled throughout his works on Malayo-Polynesian as a whole.

island of Roti. This dialect chain is most complex at the western end of the island. Political divisions on the island have fostered dialect divergence and locally it is asserted that sixteen of the seventeen former political units (*nusa-k*) had their own ‘language’. Jonker (1913), following Manafe (1889), distinguished eight dialects: three eastern dialects (*Bilba*, *Ringgou* and *Korbaffo*); two central dialects (*Termanu* – known locally as *Pada* – and *Ba’a*); and three western dialects (*Ti* – given Dutch spelling as *Thie* –, *Dengka* and *Oenale*). The location of these dialects is shown in Wurm – Hattori (1983). Differences between dialects are not only lexical, but also phonological with different dialects manifesting different historical sound correspondences. The over-all effect of the differences is that intelligibility is marginal or blocked between the more divergent dialects. Most of the early studies of Rotinese were in the dialects of *Termanu* and *Ba’a*. Jonker chose the dialect of *Termanu* as the basis for his dictionary and grammar. Fox has also concentrated on the *Termanu* dialect in his studies of ritual language.

## 2. Phonology

### 2.1 Inventory of consonants

*Table 1.* Roti consonants

		Labial	Apical	Dorsal	Glottal
Stops	v/	<i>p</i>	<i>t</i>	<i>k</i>	ʔ
	vd	<i>b</i>	<i>d</i>		
Prenasalised stops			<sup>n</sup> <i>d</i>	<sup>ŋ</sup> <i>g</i>	
Fricatives		<i>f</i>	<i>s</i>		<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		

/t/ is alveolar and /d/ is dental. *Termanu* dialect /p/ and /b/ have variants in other dialects of [mp] and [mb] respectively. /<sup>ŋ</sup>g/ has equivalents in some dialects as [g]. /l/ has a variant in other dialects as flapped [r]. /<sup>n</sup>d/ shows up in the *Ringgou* dialect as [r], and in other dialects as [l]. Semivowels /w/ and /y/ occur only in a few interjections and loan words. The homorganic nasal-consonant stops function as single unit phonemes and the prenasalisation is not syllabic.

## 2.2 Inventory of vowels

Roti has five vowel phonemes.

*Table 2.* Roti vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

High and mid vowels have lax allophones in unstressed closed syllables. Each vowel is a syllable nucleus. Thus there are no true diphthongs in Roti, but rather vowel sequences across syllable boundaries. Geminate vowels, while phonetically a long vowel, are phonemically sequences of two vowels amounting to two syllabic nuclei.<sup>1</sup> In CV-reduplication, only the first vowel is reproduced.

## 2.3 Word stress

Stress falls on the penultimate syllable of the root. The first vowel of vowel sequences carries the stress. Stress shifts to the right with the addition of syllabic object enclitics. In compounding of nouns and verbs, and in reduplication, it is the penultimate syllable of the final lexical root that bears primary word stress [ˈ = secondary stress].

- |     |            |                        |                                |
|-----|------------|------------------------|--------------------------------|
| (1) | [ˈafu]     | ‘ashes’                |                                |
|     | [ˈlima-k]  | ‘hand/arm’             |                                |
| (2) | [ˈoe]      | ‘water’                |                                |
|     | [ˈhai]     | ‘stop, come to an end’ |                                |
|     | [ˈtau-k]   | ‘man’                  |                                |
| (3) | [ˈtutu]    | ‘pound’                | < PMP <i>*tuktuk</i> ‘pound’   |
|     | [tuˈtuu-k] | ‘seat’                 | (from root <i>tuu-</i> ‘sit’). |

1. Geminate vowel sequences are distinguished only occasionally from single vowels by Rotinese when attempting to write their own language, but were not noted when recording the original data corpus from which the present word list was drawn.

- (4) ['ina(-k)] 'mother'  
 ['ina-ŋ] 'my mother'  
 [ˈina-ŋ-'ala] 'my mothers'
- (5) [ˈtasi 'oe] 'sea-water'

### 3. Morphology and morphophonemics

The subject (pre-verbal core argument), if it is pronominal, may be indicated by either a free pronoun or a pronominal proclitic within the clause. The choice is pragmatic – free pronouns are used to introduce or reintroduce a subject (new information), while pronominal proclitics index referents understood from the previous discourse or extra-linguistic context (given information). Free pronouns may also be used in topicalisation constructions. The particular form taken by the pronominal proclitics is conditioned by syllable structure and phonotactic constraints. For first person singular before vowel-initial roots, however, the free pronoun is obligatory. Free pronouns are often used to disambiguate those clitics that are not unique such as between 2sg and 2pl (see figure below).

Table 3. Roti personal deixis before morphophonemic conditioning

	Free pronouns	Subject proclitics before consonants	Subject proclitics before vowels	Object enclitics	Genitive enclitics
1sg	<i>au</i>	<i>a-</i>	<i>(u)-</i>	–	<i>-ŋ</i>
2sg	<i>o/ama</i>	<i>ma-</i>	<i>m(u)-</i>	–	<i>-m</i>
3sg	<i>ia/<sup>n</sup>dia/ana</i>	<i>na-</i>	<i>n(a)-</i>	<i>-(a)na</i>	<i>-n</i>
1pl excl	<i>ami</i>	<i>ma-</i>	<i>m(i)-</i>	–	<i>-m</i>
1pl incl	<i>ita/ata</i>	<i>ta-</i>	<i>t(a)-</i>	–	<i>-n</i>
2pl	<i>emi/ama</i>	<i>ma-</i>	<i>m(i)-</i>	–	<i>-m</i>
3pl	<i>sila/ala</i>	<i>la-</i>	<i>l(a)-</i>	<i>-(a)la</i>	<i>-n/-s</i>

Objects (post-verbal core arguments) may be indicated by either a free pronoun or an object enclitic. The form of pronominal object enclitics and genitive enclitics is also conditioned by syllable structure and phonotactics. The third plural object enclitic is often used to indicate plurality of the root.

- (6) *au-ina-ama-ŋ-ala* 'my mothers and fathers'

Before consonants (e.g. consonant-initial roots and verbal prefixes of the shape CV-) the pronominal proclitics have a constant form.

*Table 4.* Pronominal proclitics before consonants

	‘speak’ <i>fada</i>	‘gather’ <i>bu-bua</i>	‘be angry’ <i>nasa</i>	‘return’ <i>fali</i>
1sg	<i>a-fada</i>	<i>a-ka-bubua</i>	<i>a-ma-nasa</i>	<i>a-sa-fali</i>
2sg	<i>ma-fada</i>	<i>ma-ka-bubua</i>	<i>ma-ma-nasa</i>	<i>ma-sa-fali</i>
3sg	<i>na-fada</i>	<i>na-ka-bubua</i>	<i>na-ma-nasa</i>	<i>na-sa-fali</i>
1pl excl	<i>ma-fada</i>	<i>ma-ka-bubua</i>	<i>ma-ma-nasa</i>	<i>ma-sa-fali</i>
1pl incl	<i>ta-fada</i>	<i>ta-ka-bubua</i>	<i>ta-ma-nasa</i>	<i>ta-sa-fali</i>
2pl	<i>ma-fada</i>	<i>ma-ka-bubua</i>	<i>ma-ma-nasa</i>	<i>ma-sa-fali</i>
3pl	<i>la-fada</i>	<i>la-ka-bubua</i>	<i>la-ma-nasa</i>	<i>la-sa-fali</i>

Before roots beginning with vowels /i o u/, only the consonant is used of the set of proclitics listed above for vowels, except in first person singular where there is nothing. However, for roots beginning with /e/, the vowel /u/ of the proclitic replaces the /e/ of the root for first and second person singular.

*Table 5.* Pronominal proclitics before vowels

	‘drink’ <i>inu</i>	‘see’ <i>ita</i>	‘bring’ <i>oo</i>	‘go’ <i>eʔu</i>	‘bring with’ <i>eni</i>	‘follow’ <i>esi-k</i>
1sg	<i>inu</i>	<i>ita</i>	<i>oo</i>	<i>u-ʔu</i>	<i>u-ni</i>	<i>u-si-k</i>
2sg	<i>m-inu</i>	<i>m-ita</i>	<i>m-oo</i>	<i>mu-ʔu</i>	<i>mu-ni</i>	<i>mu-si-k</i>
3sg	<i>n-inu</i>	<i>n-ita</i>	<i>n-oo</i>	<i>n-eʔu</i>	<i>n-eni</i>	<i>n-esi-k</i>
1pl excl	<i>m-inu</i>	<i>m-ita</i>	<i>m-oo</i>	<i>m-eʔu</i>	<i>m-eni</i>	<i>m-esi-k</i>
1pl incl	<i>t-inu</i>	<i>t-ita</i>	<i>t-oo</i>	<i>t-eʔu</i>	<i>t-eni</i>	<i>t-esi-k</i>
2pl	<i>m-inu</i>	<i>m-ita</i>	<i>m-oo</i>	<i>m-eʔu</i>	<i>m-eni</i>	<i>m-esi-k</i>
3pl	<i>l-inu</i>	<i>l-ita</i>	<i>l-oo</i>	<i>l-eʔu</i>	<i>l-eni</i>	<i>l-esi-k</i>

Roots beginning with glottal /ʔ/ or /a/, however, take the set for vowel-initial roots with their associated vowels.<sup>1</sup>

1. Jonker tended to give Ba’a dialect weighting to his Termanu data which resulted in his marking more glottals than are present in Termanu today. Currently root-initial glottals

Table 6. Pronominal proclitics before /a/ or glottal

‘eat’	
<i>a</i>	
1sg.	<i>u-a</i>
2sg.	<i>mu a</i>
3sg.	<i>na-a</i>
1pl. excl.	<i>mi-a</i>
1pl. incl.	<i>ta-ʔa</i>
2pl.	<i>mi-a</i>
3pl.	<i>la-ʔa</i>

Verbs in the wordlist are given in the third person singular as the citation form.

Some final consonants in Roti may reflect historical retentions. The retentions are generally limited to /k n s/. In general, however, historical final consonants have been lost, in the process making way for the non-syllabic genitive enclitics.

(7) <i>uda/udan</i>	‘rain’	<	PMP <i>*quZan</i>	‘rain’
<i>anin</i>	‘wind’	<	PMP <i>*aŋin</i>	‘wind’
<i>hana/hanas</i>	‘heat’	<	PMP <i>*panas</i>	‘heat’

Genitive enclitics such as /-n/ may close the final syllable of a word. The enclitic /-k/ is used on bound roots to form independent nouns, or on some stative verb roots to indicate they are being used attributively as nominal modifiers within the noun phrase. Where /-k/ occurs on the independent form it is replaced by the genitive enclitic to indicate possession or close association with an implicit or explicit referent. The /-k/ and genitive enclitics indicate definiteness, while the absence of an enclitic may signal generic or non-specific referent.

(8) <i>ama(-k)</i>	‘(the) father’	<i>ama-n</i>	‘(her) father’
<i>ana(-k)</i>	‘(the) child’	<i>ana-n</i>	‘(his) child’
<i>ina(-k)</i>	‘(the) mother’	<i>ina-n</i>	‘(her) mother’

occur only between like vowels resulting from combination with subject proclitics or verbal prefixes.

- |     |                 |                |  |
|-----|-----------------|----------------|--|
| (9) | <i>tu-tuu-k</i> | ‘seat’         | [verb form <i>na-ŋa-tuu-k</i> ‘he sits’] |
|     | <i>tu-tuu-ŋ</i> | ‘my seat’      |  |
|     | <i>tu-tuu-m</i> | ‘your seat’    |  |
|     | <i>tu-tuu-n</i> | ‘his/her seat’ |  |

The form of object enclitics is conditioned by syllable structure. If they directly follow a vowel, only the final -CV appears. If, however, they follow a consonant such as a genitive enclitic, then they require an epenthetic vowel to break up the consonant cluster.

- (10) *mana-musu-k-ala*  
*hata-holi-la*

### 3.1 Other affixes

The main prefixes that come between the subject proclitics and roots are listed below:

- |      |              |  |
|------|--------------|--|
| (11) | <i>ma-</i>   | stative (subject is undergoer)                     |
|      | <i>mana-</i> | relativiser  |
|      | <i>ka-</i>   | stative (often substitutable with <i>ma-</i> )     |
|      | <i>ka-</i>   | causative  |
|      | <i>sa</i>    | verbal prefix                                      |
|      | <i>fa-</i>   | durative (alternatively by reduplication of root)  |
|      | <i>pa-</i>   | verbal prefix                                      |
|      | <i>ŋa-</i>   | iterative (alternatively by reduplication of root) |
|      | <i>la</i>    | verbal prefix                                      |
|      | <i>ta-</i>   | agentless passive                                  |

A root with the stative *ma-* used verbally is preceded by a subject proclitic. Roots with the stative *ma-* may be used attributively (as an adjective) within the noun phrase without a subject proclitic. A subject proclitic with the stative *ma-* may indicate process.

- |      |                        |                      |
|------|------------------------|----------------------|
| (12) | <i>tou-k-a na-dema</i> | ‘That man is tall’   |
|      | <i>tou-k-ma-dema</i>   | ‘tall man’           |
|      | <i>na-dema</i>         | ‘He is tall’         |
|      | <i>na-ma-dema</i>      | ‘He is growing tall’ |
|      | <i>oema-dema</i>       | ‘deep water’         |

The prefix *mana-* is used as a relativiser.

(13) <i>tou-mana-hapunale-k</i> <i>ina-mana-boŋi-k-a</i>	‘the man who has luck’ ‘that woman who gave birth’
(14) <i>mana-tunu-k</i>	‘(that) which is roasted’
(15) <i>na-ʔa-k</i> <i>mana-na-ʔa-k</i>	‘he eats’ ‘(that) which he eats’

### 3.2 Reduplication

Reduplication in Roti is both productive and pervasive. Reduplication of the first consonant and vowel (CV-reduplication) functions as follows: CV-reduplication may indicate a noun associated with the result or quality of the root.

(16) <i>ledo</i> <i>le-ledo-k</i>	‘sun’ ‘light (n)’
(17) <i>boŋi</i> <i>bo-boŋi-k</i>	‘give birth, beget’ ‘offspring’

CV-reduplication can indicate the substance which undergoes the action of the root. The reduplication can include the subject proclitic.

(18) <i>pake</i> <i>pa-pake-k</i>	‘put on (clothes)’ ‘clothes’
(19) <i>inu</i> <i>n-inu</i> <i>ni-ninu-k</i>	‘drink’ ‘3sg-drinks’ ‘beverage, drink (n)’

CV-reduplication can also indicate the instrument used to perform the action.

(20) <i>tofa</i> <i>to-tofa-k</i>	‘clearing underbrush’ ‘sickle’
(21) <i>sapu</i> <i>sa-sapu-k</i>	‘sweep’ ‘broom’
(22) <i>kabi</i> <i>ka-kabi-k</i>	‘pinch, squeeze’ ‘tongs’

Verbal CV-reduplication indicates repetitive or iterative aspect.

(23) <i>ŋe-ŋeu</i> <i>ke-keʔe</i> <i>bo-boʔo</i>	‘fan (v)’ ‘knead’ ‘cough’
--	---------------------------------

- |      |                 |               |
|------|-----------------|---------------|
| (24) | <i>ha-hae</i>   | 'breathe (v)' |
|      | <i>ha-hae-k</i> | 'breath (n)'  |

- |      |                |                             |
|------|----------------|-----------------------------|
| (25) | <i>tana</i>    | 'pile up'                   |
|      | <i>ta-tana</i> | 'pile up (multiple action)' |

CV-reduplication can indicate the location in space or time associated with the root.

- |      |                  |                                       |
|------|------------------|---------------------------------------|
| (26) | <i>masuk</i>     | 'enter' (Malay loan)                  |
|      | <i>ma-masu-k</i> | 'Sunday (the day of entering church)' |

- |      |                |   |
|------|----------------|---|
| (27) | <i>la-lae</i>  | 'corral or stable for large domestic animals' |
|      | <i>le-lesu</i> | 'door'  |
|      | <i>pa-pala</i> | 'wall'  |
|      | <i>ma-mana</i> | 'place'                                       |

There is glottal insertion with CV-reduplication of /a/-initial roots.

- |      |                            |         |
|------|----------------------------|---------|
| (28) | <i>a<sup>ʔ</sup>-adu-k</i> | 'dough' |
|------|----------------------------|---------|

Full reduplication of a root indicates intensity and tends to be adverbial in nature.

- |      |                  |                        |
|------|------------------|------------------------|
| (29) | <i>kiu-kiu</i>   | 'pitch dark'           |
|      | <i>nene-nene</i> | 'listen'               |
|      | <i>lai-lai</i>   | 'immediately, quickly' |
|      | <i>koe-koe</i>   | 'slowly'               |

#### 4. Notes on orthography

Since a large corpus of Rotinese materials is available for study, it is important to distinguish between various conventions used to represent the language, in particular, the conventions adopted by Jonker, more recently by Rotinese themselves attempting to write their own language, and those used for the present study.

Table 7. Different conventions of spelling

Jonker	Practical Orthography	CAD
e, è	e	e
o, ò	o	o
diaeresis on V	'	ʔ
<sup>h</sup> g	<sup>h</sup> g	ɣ
ngg	ngg	<sup>h</sup> g
nd	nd	<sup>h</sup> d
j	y	y <sup>1</sup>

In Jonker's orthography, the glottal stop is indicated by a dieresis over the following vowel. Thus *taëk* 'boy'. This is rendered in the practical orthography as *ta'ek*. In this word list, glottal is represented by /ʔ/, *taʔek*.

## 36. Buru (Masarete)

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>Charles E. Grimes</i>
---------------	--------------------------

Wordlist:	<i>Charles E. Grimes – Wesley M. Lesnussa</i>
-----------	---

---

### 1. Introduction

---

The Buru language is spoken by approximately 43,000 people on an island (9800 km<sup>2</sup>) of the same name in the province of Maluku, eastern Indonesia. An additional 2,000 speakers of Buru live elsewhere, primarily in Ambon, Jakarta, and the Netherlands. Other indigenous languages spoken on Buru Island are Hukumina<sup>1</sup> in the northwest (1 speaker left in 1989), and Kayeli in the east (4 speakers left in 1989). Other varieties of Kayeli, such as Lumaete, Lumara, Ilat, Moksela, Leliali and Marulat, are now extinct. Other varieties of Hukumina, such as Bara, Tomahu and Palamata, are also now extinct.

Various immigrant languages also have significant colonies on Buru. The language of Ambelau (5,700 speakers), from an island to the south of Buru, is spoken in the village of Wae Tawa on the southeast coast of Buru. More than 20,000 Javanese have settled in the lower Wae Apo river valley in a government transmigration programme and are converting that area to wet-rice cultivation. Approximately 12,600 Butonese (from southeast Sulawesi) have settled for at least 14 generations along the west and south coasts of Buru, and around 12,500 immigrants from the Sula islands to the north have settled the northern coastal strip of Buru for 12-14 generations.

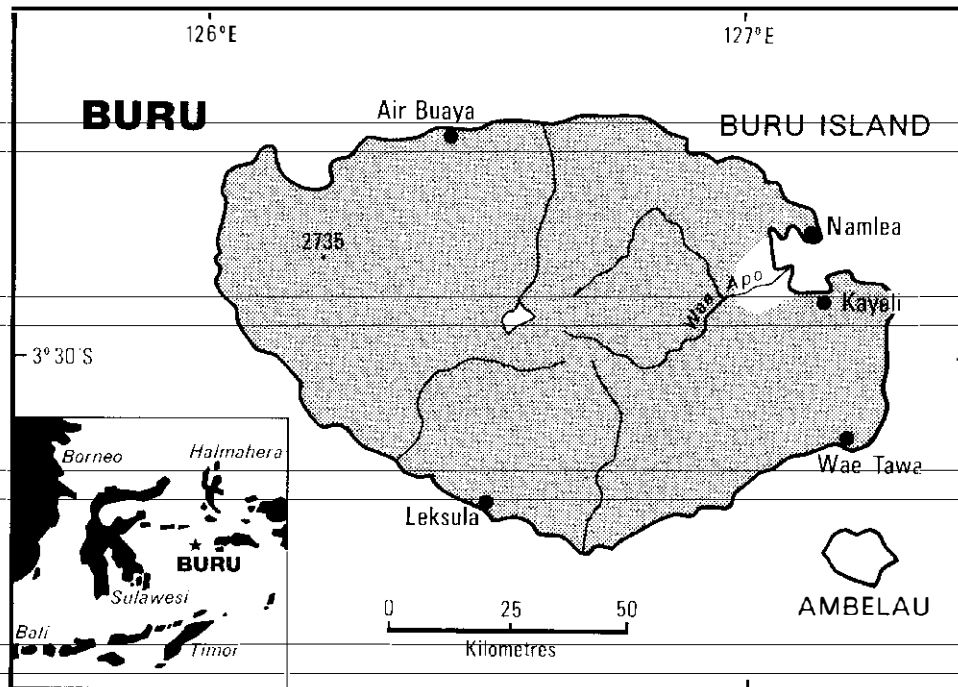

There are five main dialects of the Buru language: the *Wae Sama* dialect (6,600 speakers) is spoken in the southeast; the *Masarete* dialect (9,600) is spoken in the south-central part of the island; the *Rana* dialect (14,250) is spoken in the central part of the island with the subdialects of Rana, Wae Kabo, Hameta (Wae Tina), and Wae Geren; the *Lisela* dialect (11,900), also referred to as Li Enyorot, is spoken on the narrow coastal strip on the north

---

1. Hukumina may represent an old migration from the Buton area off south-east Sulawesi and be non-indigenous to Buru.

---

coast in an area heavily populated by immigrant groups;<sup>1</sup> and the *Fogi* dialect (500), also known as Li Emteban, has remnants along the southwest coast. Language use in the Wae Sama, Rana and Masarete dialect areas is vigorous, Buru being used as the primary means of daily communication. Indigenous Buru inhabitants in the Lisela and Fogi areas are a minority living in multiethnic, multilingual settings and many of the speakers of these two Buru dialects have shifted to Ambonese Malay as their primary vehicle for communication.<sup>2</sup> Intelligibility between Lisela and the other dialects of Buru is marginal, requiring adjustment on the part of those trying to communicate. A special taboo speech register called *Li Garan* is spoken by some people from the Rana area when they are in the part of the jungle called Garan in the northwest quadrant of the island. Li Garan is formed primarily by lexical substitution and circumlocution of standard Buru words and is based on standard Buru syntax and morphology.<sup>3</sup>

Map 36. Buru language area

1. *Lisela* is divergent enough that, under some criteria, it could be considered a separate language.
2. See B.D. Grimes (1991b) for a discussion of the regional and historical influences on the ethnolinguistic vitality of Buru speech communities.
3. See Grimes – Maryott (1991) for a thorough description of *Li Garan* in the wider Austronesian context.

Data were recorded (primarily as tape recorded texts from a wide variety of speech genres) by the author and his wife (Barbara Dix Grimes) over a period of twelve months in residence in the interior of the Masarete, Rana, and Wae Sama areas from 1985 to 1989.<sup>1</sup> An additional two months of data gathering were carried out off the island with speakers of the Masarete dialect. Data from Kayeli and Lisela were recorded by the author on field trips in 1983 and 1989. Although many people have contributed bits and pieces of information, our primary informants have been Lokis Hukunala, Anton Lesnussa (now deceased), Wesly Lesnussa, Dominggus Nurlatu, Otniel Seleky, and Theda Yom Siahaya. Wesly Lesnussa co-authored the word list.

The best known study on Buru is a brief grammar sketch and glossary of Masarete by Hendriks (1897), which was used by scholars such as Jonker (1906), Brandstetter (1916), Dempwolff (1925) and Stresemann (1918, 1927). Additional grammar notes and texts are found scattered through the orthographic writings of Joh. A.F. Schut (e.g. Schut 1919). C.E.

Grimes (1991) describes aspects of Masarete phonology, morphology and discourse.<sup>2</sup> Buru kinship semantics and social structure are described in B.D. Grimes (1990).

Items listed as borrowings from Malay refer to *Ambonese Malay* (Collins 1980, C. Grimes 1985, B. D. Grimes, 1991a), the lingua franca of the area, *not* to Standard Malay. Unless noted otherwise, the following description refers to the *Masarete* dialect of Buru.

## 2. Summary of the phonology and morphophonemics

Below is a brief overview of Buru phonology and morphophonemics. Additional discussion on historical aspects of the phonology may be found in C. Grimes (1991).

1. Fieldwork was conducted as part of a cooperative programme between Pattimura University and the Summer Institute of Linguistics under the auspices of the Department of Education and Culture of the Republic of Indonesia. Fieldwork in 1988-1989 was additionally supported by the Australian National University. Thanks are due both to the Government of Indonesia and to many friends on the island of Buru who have been so willing to share their homes, their food, their language and culture, and their joys and sorrows.
2. A modern reference grammar and a dictionary by the author are in process.

## 2.1 Word stress

Stress falls on the penultimate syllable of the word. Stress is not affected by the addition of suffixes or enclitics, such as the phrase-level plural marker /-ro/, or by the addition of a paragogic /e/.

## 2.2 Inventory of consonants

Buru has seventeen consonant phonemes plus one borrowed phoneme (ǰ).

*Table 1.* Buru consonants

		Labial	Apical	Laminal	Dorsal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>č</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	( <i>j</i> )	<i>g</i>
Fricatives		<i>f</i>	<i>s</i>		<i>h</i>
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels		<i>w</i>	<i>y</i>		

The /t/ tends to be dental. The /r/ is trilled, but may become a flap or tap intervocalically. The /č/ occurs with very low frequency and derives from the historical clustering of voiceless stop + /s/; it is also found in borrowed words.<sup>1</sup> The phoneme /ǰ/ occurs only in borrowed words.

## 2.3 Inventory of vowels

Buru has five vowel phonemes.

*Table 2.* Buru vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

1. Lisela does not have /č/, but maintains the cluster of voiceless stop + /s/.

High front vowel /i/ tends to be lowered to its lax allophone [ɪ] in unstressed syllables; otherwise it is the tense [i]. High back vowel /u/ tends to be lowered to its lax allophone [ʊ] in unstressed closed syllables; otherwise it is the tense [u].

Each vowel forms the nucleus of a syllable. Consequently there are no diphthongs in Buru. Geminate vowels are sequences across syllable boundaries with the first vowel carrying the stress [(C)V.V].<sup>1</sup>

(1)	<i>ii</i>	‘thing’
	<i>nee</i>	‘six’
	<i>haa</i>	‘get bigger’
	<i>maa-n</i>	‘tongue’
	<i>doo</i>	‘where?’
	<i>puu-n</i>	‘tree’

## 2.4 Phonotactic constraints and morphophonemic processes

Words may end only in /-t, -n, -k, -h, -l/, the plural enclitic /-ro/ or vowels. The /-l/ is restricted to a few lexical items and seems to reflect a frozen retention of a suffix that is still productive in some of the languages of western Seram. The /-t/ derives an instrumental noun from an active verb, an adjective from a non-active verb or a free noun, and forms an independent noun whose identity is understood and is perceived to be a whole unit from a bound noun. The /-n/ marks a genitive relationship with an explicit or implicit referent. The /-k/ repackages the role structure of the verb when added to a verb root, or incorporates an argument within the verb phrase (backgrounding antipassive) when attached to the end of a post-verbal argument. The /-h/ is a third singular object pro-form. In a small number of cases, word final /t n k/ reflect frozen retentions of parent forms.

### 2.4.1 Raising of /o/ to /u/

Words of the shape (C)VCV ending in /o/ have the final vowel raise to /u/ when a suffix or enclitic is added.

(2)	<i>kabo</i>	‘murky, cloudy, obscure’
	<i>kabu-i</i>	‘mud’

1. All combinations of vowel sequences occur, except \*/ui/ and \*/uo/. /ui/ does occur in loans.

(3)	<i>kako</i>	‘outside’
	<i>kaku-n</i>	‘ridge’
(4)	<i>defo</i>	‘stay, sit’
	<i>defu-k</i>	‘leave s.th. behind’
(5)	<i>ego</i>	‘get, take, transfer’
	<i>egu-h</i> <sup>1</sup>	‘get it, take it’

### 2.4.2 Vowel harmony with two back vowels

If there is a consonant between two back vowels (VCV), there is a constraint of vowel harmony such that both vowels are /o/ and the /o/ > /u/ raising mentioned above is blocked.<sup>2</sup>

(6)	<i>soso</i>	‘to nurse, suckle a baby’	[PMP * <i>susu</i> ]
	<i>soso-n</i>	‘breast’	
(7)	<i>toho</i>	‘descend’	[PMP * <i>tuRun</i> ]
	<i>toho-n</i>	‘path, trail’	

But if there is no consonant between back vowels (VV) neither the vowel raising nor the vowel harmony apply.

(8)	<i>tou-k</i>	‘see, look after s.th.’
	<i>tuu-k</i>	‘lift up, appoint’
	<i>soo-k</i>	‘suspend, hang with rope’

### 2.4.3 Vowel harmony with plural enclitic /-ro/

There is a further vowel harmony constraint. When the phrase-level plural enclitic *-ro* is attached to a root ending in /u/, the root-final vowel lowers to [o].

(9)	<i>fafu</i>	‘pig’	[PMP * <i>babuy</i> ]
	<i>faforo</i>	‘pigs’	
(10)	<i>asu</i>	‘dog’	[PMP * <i>asu</i> ]
	<i>asoro</i>	‘dogs’	

1. The /-h/ is often inaudible. Three things may signal its presence: 1) its pronunciation, 2) vowel raising, or 3) the addition of a paragogic /e/ which forces the pronunciation of the /-h/. Thus, /*ego-h*/ may have the phonetic variants [*eguh*, *egu*, *eguhc*].

2. In the Lisela dialect both vowels are /u/ rather than /o/.

#### 2.4.4 Coalescence of like consonants across morpheme boundaries

Across morpheme boundaries there is a coalescence of like consonants to a single unit phoneme.

- |      |                  |               |                      |
|------|------------------|---------------|----------------------|
| (11) | <i>enewet</i>    | ‘life’        | from /en-newe-t/     |
|      | <i>teputelun</i> | ‘chicken egg’ | from /tepu-t telu-n/ |

#### 2.4.5 The shape of the antepenultimate syllable

There are constraints that the shape of the antepenultimate syllable must be VC, and the prothetic vowel must be /e/.<sup>1</sup> There is a historical deletion of the vowel from the antepenultimate syllables of PAN trisyllabic roots and the addition of the prothetic vowel /e/.

- |      |                |                 |           |
|------|----------------|-----------------|-----------|
| (12) | PAN            | Buru            | Gloss     |
|      | <i>*Caliga</i> | <i>etliga-n</i> | ‘ear’     |
|      | <i>*kuRita</i> | <i>ekhita</i>   | ‘octopus’ |

The constraint on the shape of antepenultimate syllable affects the phonological shape of prefixes as well. Prefixes take the form /eC-/, with the prothetic /e/.

- |      |                  |            |  |
|------|------------------|------------|--|
| (13) | PAN              | Buru       | Buru Function                              |
|      | <i>*pa-</i>      | <i>ep-</i> | causative (active agentive)                |
|      |                  | <i>ek-</i> | causative (passive agentive)               |
|      |                  | <i>eg-</i> | causative (passive agentless, adversative) |
|      |                  | <i>ef-</i> | causative (active agentive, out of)        |
|      |                  | <i>es-</i> | verbal (contact of surfaces)               |
|      | <i>*ma-</i>      | <i>em-</i> | stative                                    |
|      |                  | <i>eb-</i> | stative                                    |
|      | <i>*ni- -in-</i> | <i>en-</i> | abstract nominaliser <sup>2</sup>          |

Before roots beginning with voiced stops or stems that already have a prefix, the causative /ep-/ takes the shape /pe-/.

- |      |             |   |           |                    |
|------|-------------|---|-----------|--------------------|
| (14) | /ep-bahi-n/ | > | [pebahin] | ‘have an argument’ |
|      | /ep-em-gea/ | > | [pemgea]  | ‘embarrass s.o.’   |

1. In compounding, the vowel can be other than /e/, and the shape can be CVC.
2. The prefixes shaped /eC-/ contrast with pre-verbal Tense-Aspect-Mood particles of the shape CV, such as *ba* ‘durative’, *ka* ‘habitual’, *te* ‘abilitative’, *la* ‘irrealis’, *ma* ‘realis’.

The prothetic /e/ is not present following a vowel. This is prevalent in forms lexicalised from tabooing, where cliticisation is also involved, or in normal speech.

- (15) *inewet* 'snake' (generic) /ii-en-newe-t/ thing-ABS-live-NOM  
 (16) *gebampe* 'sick person' /geba em-pei/ person STAT-hurt

#### 2.4.6 Neutralisation of voiceless stops to glottal

Voiceless stops /p t k/ may be neutralised to glottal [ʔ] immediately preceding the first consonant of a penultimate syllable.<sup>1</sup> /p/ becomes glottal before /m n ŋ w y/.

- (17) /ep-mata/ > [eʔmata] 'CAUS-die (=kill)'  
 /ep-wei-k/ > [eʔweik] 'CAUS-shout-k'

/t/ becomes glottal before /l m n ŋ p/ and optionally becomes glottal before /k ɾ/.

- (18) /etliŋa-n/ > [eʔliŋan] 'ear'  
 /en-toho-n/ > [eʔnohon] 'descent (ancestry)' [metathesis]  
 [etrua] ~ [eʔrua] 'eight'

/k/ becomes glottal before /l m n ŋ p r t w/.

- (19) /saka-mena/ 'up-dry' > [saʔmena] 'in front'  
 /kuasa/ 'strength' (loan) > [eʔwasa] 'wealth, influence'  
 /en-kodo-t/ > [eʔnodot] 'grinding(stone)' [met.]

#### 2.4.7 Palatalisation with vowel initial roots

Prefixes become palatalised when attached to roots beginning with a vowel.

- (20) /ep-oso-k/ CAUSE-enter-k > [epyosok] 'put s.th. into s.th.'  
 /en-oli-t/ ABS-return-NOM > [enyolit] 'return (fare)'  
 /en-ino-t/ ABS-drink-NOM > [enyinut] 'drinking (water)'  
 /en-ego-n/ ABS-take-GEN > [enyegun] 'taken (goods)'  
 /ep-abi-k/ CAUS-good-k > [epyabik] 'fix s.th.'

1. Note, however that the sequences [epm]/[eʔm] and [etn]/[eʔn] are phonetically difficult to distinguish. Both variants occur.

### 2.4.8 Metathesis with /en-/

The abstract nominaliser /en-/, when connected to roots beginning with /f k s t/ results in metathesis of the adjacent consonants.

(21)	<i>en-foi-t</i>	ABS-bathe-NOM	>	[efnoit]	'bathtub'
	<i>en-kadu-t</i>	ABS-come-NOM	>	[eʔnadut]	'arrival'
	<i>en-suba-n</i>	ABS-cross threshold-GEN	>	[esnuban]	'threshold'
	<i>en-toho-n</i>	ABS-descend-GEN	>	[eʔnohon]	'descent'

### 2.4.9 Cliticisation

Cliticisation (loss of final vowel and loss of primary word stress) signals tighter semantic cohesion in the phrase, or compounding. [' = stress].

(22)	' <i>tuba</i> 'haa-t	'big drum (among several of a single type)'
	<i>tub</i> 'haa-t	'type of drum known as <i>big-drum</i> '

(23)	<i>geb</i>	<i>fuk</i>	'Abon	' <i>tau</i> -n
	'geba	'fuka	'Abon	'tau-n
	person	island	Ambon	CLASS-GEN
	'an Ambonese'			

(24)	<i>an-</i>	' <i>feho-ro</i>
	'ana-	'fehu-ro
	child	new -pl
	'the young generation/the new generation'	

## 2.5 The functions of reduplication

Formally there are several kinds of reduplication in Buru, from multiple repetition<sup>1</sup> and full reduplication of the stem, to reduplication of the root, reduplication of the first CVC, reduplication of the first CV, and reduplication of the first C.

### 2.5.1 Full reduplication of nouns

Full reduplication of nouns has a distributive function indicating 'each (n)'

1. Up to 14 repetitions recorded.

- (25) *geba-geba* 'each person'  
*huma-huma* 'each house'

### 2.5.2 Reduplication of verbs

Full or partial reduplication of active verbs indicates an iterative (repetitive) aspect when the verb is the main verb.

- (26) *iko-iko* 'went (repeatedly)',<sup>1</sup>  
*soh-sohik* 'waited (repeatedly)'

Reduplication of verbs used to modify main verbs indicates an adverb of manner.

- (27) *iko roho-roho* 'go slowly'  
*bisi gos-gosa* 'carve well'

Reduplication of non-active verbs as the main verb indicates intensity.

- (28) *haa-haa* 'really big'  
*empei-mpei* 'really sick'

### 2.5.3 Reduplication of consonant

Reduplication of the first consonant of a root, with the addition of an epenthetic /e/, indicates the semantic relationship of HAVE.

- (29) *enhero pe-paŋa* spear HAVE-barb = 'barbed spear'  
*tonal fe-folo* cuscus HAVE-fur = 'cuscus with fur still on'  
*kapal pe-pani* ship HAVE-wing = 'airplane'

For roots that begin with a vowel the first consonant is also reduplicated. The palatalisation of vowel-initial roots mentioned above blocks the need for an epenthetic /e/.

- (30) *palaki-oko* rice HAVE-skin = 'rice in the husk'

1. This is in contrast to the durative *ba iko* 'continue to go' or the habitual *ka iko* 'habitually goes'.

## 2.6 Voicing as a grammatical feature

There are numerous pairs of lexical items and two pairs of prefixes in which the voiced/voiceless contrast carries a grammatical function. Prototypically, the voiceless member of the pair indicates a volitional agent and the voiced member indicates no agent or unimportant agent.

(31)	<i>tata-k</i>	‘drop s.th.’
	<i>data-k</i>	‘s.th. dropped’
(32)	<i>tela</i>	‘separate s.th.’
	<i>dela-k</i>	‘s.th. separated (lengthwise, as a rubberband breaks)’
(33)	<i>kesu-k</i>	‘break s.th.’
	<i>gesu-k</i>	‘s.th. breaks’
(34)	<i>ek-hida</i>	‘be torn (volitionally)’
	<i>eg-hida</i>	‘be torn (accidentally)’
(35)	<i>ep-rari-k</i>	‘destroy s.th.’
	<i>eb-rari k</i>	‘be destroyed’

## 3. Notes on syntax

Personal deixis in Buru is handled by a variety of pronominal systems.

Table 3. Pronominal systems in Buru

	Free pronouns	Pronominal proclitics	Possessive words	Genitive enclitics <sup>1</sup>
1sg	<i>yako</i>	<i>ya/a</i>	<i>najo</i>	<i>-ŋ</i>
2sg	<i>kac</i>	<i>ku</i>	<i>namo</i>	<i>-m</i>
3sg	<i>riŋe/rine</i>	<i>da</i>	<i>nake</i>	<i>-n</i>
1pl excl	<i>kami</i>	<i>kam</i>	<i>nami</i>	<i>-nam</i>
1pl incl	<i>kita</i>	<i>ma</i>	<i>nanc</i>	<i>-nan</i>
2pl	<i>kimi</i>	<i>kim</i>	<i>nimi</i>	<i>-nim</i>
3pl	<i>sira</i>	<i>du</i>	<i>nini</i> <sup>2</sup>	<i>-nin</i>

1. In the Masarete dialect the entire genitive system has collapsed to the 3sg *-n* form for all person and number combinations.

2. In the Masarete dialect 3plPOSS is *nunu*.

Free pronouns indicate new or reintroduced information in the discourse. They appear in topicalisation constructions, as subjects of both transitive and intransitive verbs, as subjects of non-verbal clauses, as objects of transitive verbs, and as objects of prepositions. Pronominal proclitics signal given information in the discourse. They are used only as syntactic subject (of both transitive and intransitive verbs, and of non-verbal clauses) and are never used as object. Both the genitive construction and the possessive construction may be used interchangeably with all roots. There is no distinction between alienable and inalienable possession.

#### 4. Notes on the practical orthography

Following the preferences of readers in preliminary orthography testing, coalesced phonemes are written as a single unit. There is also under-representation of the voiceless stops becoming glottal. Thus, the first consonant (C<sub>1</sub>) of a three-syllable word of the shape eC<sub>1</sub>VCV(-C) may be either preglottalised (most common) or a coalescence of two homogeneous phonemes acting as a single unit. Readers do not have difficulty distinguishing from the context.

- (36) *mata*            ‘die’  
       *emata*           ‘kill’    [eʔmata] from /ep-mata/
- (37) *newe*            ‘live’  
       *enewet*        ‘life’    [enewet] from /en-newe-t/
- (38) *kaa*             ‘eat’  
       *inaan*           ‘food’   [iʔnaan] from /ii-en-kaa-n/<sup>1</sup>

The velar /ŋ/ is written with a digraph /ng/ in the practical orthography for reader transferability to Indonesian.

Note: The practical orthography is not used in the comparative wordlist in this volume.

1. This form has a) cliticisation, b) absence of prothetic /e/, c) metathesis, and d) /k/ becoming glottal.

## 37. Dobel (Aru Islands)

---

---

<b>Contributor:</b>
---------------------

Wordlist and Introduction: <i>Jock Hughes</i>
---

---

---

### 1. Introduction

---

---

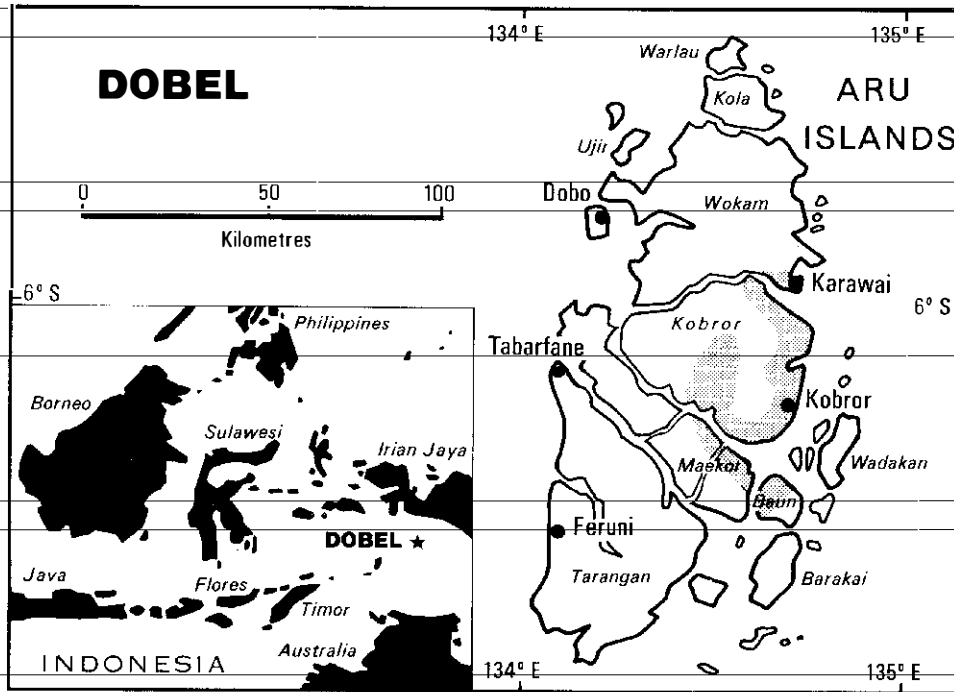

The Dobel language, pronounced [do'bɛl], is spoken in the Aru islands which are in the south-east of the Province of Maluku, Indonesia. Dobel is one of the larger of the 12 languages spoken in the Aru Islands. It is spoken mainly on the eastern half of the large central island of Kobror and also in some villages on neighbouring islands just across the narrow straits of Barakai, to the south, and Manombai to the north. Dobel has several dialects. The first is the inland dialect, spoken in the villages up-river and in the villages which border the Barakai Strait. Secondly there is the south-eastern dialect, spoken on the east coast of Kobror Island from Ponom, at the mouth of the Barakai Strait, northwards to Warjukur. The third is the north-eastern dialect spoken in four villages in the north-east of Kobror Island, and in Karwai village just across the mouth of the Manombai strait on the south-eastern tip of Wokam Island. Within these dialects there is minor variation from village to village. The author and his family have lived in one village from each of these dialect areas, and are now living in Kojjabi village in the north-eastern dialect area, which is where the wordlist was elicited. Kojjabi is the largest Dobel-speaking village. The fourth dialect is the Koba dialect, spoken in three villages on Baun and Fukarel Islands, which lie south-east of Kobror Island. This dialect, while sometimes considered a separate language, is largely mutually intelligible with the other three dialects and shares a high percentage of cognates with them. Dobel is spoken by about 5,000 people (not including those who live outside the area).

Dobel data have been recorded by the author and his wife (Katy Hughes) during four periods in the Dobel area. The first and second were in Warjukur in the south-eastern dialect area (a month in 1985 and a month in 1986), the third was in Algadang in the inland dialect area (three and a half months in 1988), and the fourth was in Kojjabi (three months in 1988). The data recorded in the wordlist have been restricted to forms found in Kojjabi. There were other periods of data-gathering from Dobel speakers outside the Dobel-speaking area. Our main informant for the wordlist was Elkanah

Selpanay of Kojabi. The field work is being conducted under the auspices of the Department of Education and Culture of the Government of the Republic of Indonesia, as part of a cooperative programme by Pattimura University, Ambon, and the Summer Institute of Linguistics.

Map 37. Dobel language area

## 2. Summary of the phonology

Here follows a brief overview of the phonology of Dobel.

### 2.1 The phonemes

Dobel, as spoken in Kojabi, has 14 consonant phonemes, /t k<sup>w</sup> ? b d φ s l r m n ŋ w y/, and it has five vowel phonemes, /i e a o u/.

In the diagrams below the phonemes appear by point and mode of articulation.

Table 1. Dobel consonants

	Bilabial	Dental/ Alveolar	Palatal	Velar	Labialised velar	Glottal
Stops	vɪ vd	<i>b</i>	<i>t</i> <i>d</i>		<i>k<sup>w</sup></i>	<i>ʔ</i>
Fricatives		<i>ɸ</i>	<i>s</i>			
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Vibrants			<i>r</i>			
Semivowels		<i>w</i>		<i>y</i>		

Table 2. Dobel vowels

	Front unrounded	Central unrounded	Back rounded
Close	<i>i</i>		<i>u</i>
Open	<i>e</i>	<i>a</i>	<i>o</i>

### 2.1.1 Phoneme variants

The phoneme /k<sup>w</sup>/ has variants [k<sup>w</sup>] preceding the non-back vowels /i, e, a/ and [k] preceding the back vowels, /u, o/. Thus:

/k <sup>w</sup> ak <sup>w</sup> a/	[k <sup>w</sup> ak <sup>w</sup> ə]	‘small, child’
/k <sup>w</sup> eɪ/	[k <sup>w</sup> eɪ]	‘his younger sibling’
/rak <sup>w</sup> in/	[rək <sup>w</sup> in]	‘leaf’
/k <sup>w</sup> oyər/	[k <sup>w</sup> oyər]	‘dog’
/k <sup>w</sup> otʊ/	[k <sup>w</sup> otʊ]	‘if’
/ʔu'yak <sup>w</sup> ur/	[ʔu'yakur]	‘I pound’

The phoneme /ɸ/ has variants {ɸ} (bilabial fricative) and [p] (bilabial plosive) which occur in free variation, although there is a tendency for the plosive to occur following /m/. In all other environments the fricative is far more common.

The vowel phoneme /a/ is realised in stressed syllables as [a], and in unstressed syllables as either [ʌ] or [ɔ]. These latter two phones occur in free variation in unstressed syllables. The phoneme /e/ is realised roughly midway between [e] and [ɛ] and the phoneme /o/ roughly midway between [o] and [ɔ].

## 2.2 The syllable and phoneme distribution

There are two syllable types in Dobel, CV and CVC. There are therefore no vowel clusters, with the exception of one caused by a morphophonemic change to the suffix *-ŋu* '1st singular object enclitic' or '1st singular inalienable possession suffix' (see below).

All vowels may occur as the nucleus of either CV or CVC syllables.

All consonant phonemes may occur syllable-initially; that is, they may occur word-initially, intervocalically, or as the second member of a word-medial consonant cluster.

Only the phonemes /l r m n y w/ may occur syllable finally in a CVC syllable; that is, they may occur as the first member of a word medial consonant cluster or they may occur word finally. The phoneme /ŋ/ may also occur word finally as a result of morphophonemic change to *-ŋu* '1st singular object enclitic' or '1st singular inalienable possession suffix' (see below).

In very restricted circumstances the phoneme /m/ may occur word finally following a consonant. This occurs when the second person singular inalienable possession suffix, *-m*, occurs after a root final consonant, e.g. /larm/ 'your voice'. (It is more normal for *-m* to be replaced by a zero morpheme in these circumstances – see below.) Much more common is the use of the second person singular verb inflectional prefix *m-* which always occurs before a root initial consonant, e.g. /m'so/ 'you cut'. The phoneme /n/ also occurs word initially before a consonant in /n'da/, the shortened form of /naʔu'da/ 'no, not'. In each of these cases the nasal sounds syllabic; we have not, however, set up a separate syllable type, because the occurrence of word initial or word final consonant clusters is restricted exclusively to these three morphemes. These are simply identified as exceptions to the rules governing the Dobel syllable.

## 2.3 The phonological word

The phonological word in Dobel is defined as a stress group. Each phonological word is the domain of one primary stress which occurs on the

nuclear syllable. The stress occurs on the grammatical root. However, stress is contrastive in Dobel. Although it more normally occurs on the penultimate syllable of the root, it may also occur root finally. Thus /da-'tabay/ 'they carry (on shoulders)' contrasts with /da-ta'bay/ 'they hit'. Words ending in /ʔu/ or /tu/ are stressed on the antepenultimate syllable. This is because historically the /u/ has been added to avoid a syllable final plosive, which is not allowable in Dobel syllable structure. The cognates of these words in other Aru languages are disyllabic words ending in /k/ (equivalent to Dobel /ʔ/) or /t/.

## 2.4 Morphophonemic processes

The morphophonemic processes which occur in Dobel all concern suffixes, except that in the inland dialect the second person singular inflectional prefix, *m-*, undergoes homorganic nasal substitution before the initial consonants of all verb roots. However this does not occur in the dialect where the wordlist was elicited. The other morphophonemic processes which do not occur in Koijabi are as follows:

- (1) *-ŋu* '1st singular object enclitic' or '1st singular inalienable possession suffix' metathesises to *-uŋ* when it follows a root final /a/, thus:

<i>'sama + -ŋu</i>	>	<i>'samauŋ</i>	'my father'
<i>ʔa-'yok<sup>w</sup>a + -ŋu</i>	>	<i>ʔa'yok<sup>w</sup>auŋ</i>	'he sees me'

This metathesis causes two unique phenomena in the language. These are: the only occurrence of a vowel cluster, and the only occurrence (in this dialect) of word final /ŋ/.

- (2) *-ni* 'third person singular object enclitic' metathesises to *-in* following root final /l/. This process only occurs in the north-east dialect.

<i>nal + -ni</i>	>	<i>nalin</i>	'he takes it (animate)'
------------------	---	--------------	-------------------------

- (3) *-ni* 'third person singular object enclitic' or 'third person singular adjective agreement suffix' often drops its final vowel and becomes *-n* following a root final vowel, /y/ or /w/. This process is optional, but usually occurs in Koijabi.

<i>ʔu-'yok<sup>w</sup>a + -ni</i>	>	<i>ʔu'yokwan</i>	'I see him'
<i>bu'lay + -ni</i>	>	<i>bu'layn</i>	'he is hungry'

- (4) The suffix *-m* ‘second person singular inalienable possession’ is usually replaced by a zero morpheme after root final /l r m n/. There are rare exceptions to this rule. It is true for the main dialects of Dobel. Thus:

*taʔar + -m* > *taʔar* ‘your ears’

- (5) *-ye* ‘third person plural object enclitic’ or ‘third person plural adjectival agreement suffix’ undergoes two different morphophonemic changes. Firstly, when it follows root final /a/, the suffix merges with the root, resulting in the root final vowel becoming /e/. This rule is optional. Secondly, when it follows a root final consonant, the /y/ drops out. Both these rules are only found in the north-east dialect. Thus:

*'sina + -ye* > *'sine* or *'sinaye* ‘they are big’  
*ʔa-'lugun + -ye* > *ʔa'lugune* ‘he hides them’

### 3. Some notes on morphology

There follow some observations on the morphology of Dobel. For brevity’s sake I have restricted this to an overview of the morphology of the three main word classes of Dobel, (a) nouns (and pronominals), (b) adjectives and (c) verbs.

#### 3.1 Nouns and pronominals

##### 3.1.1 Noun classes

All nouns in Dobel belong to one of two noun classes, animate and inanimate, which are set up on the basis of the following factors: (a) adjective agreement, (b) numeral agreement, (c) the use of different sets of demonstratives and pronouns, and (d) different pronominal object enclitics that replace them. In each of the above mentioned phenomena, with the exception of numeral agreement, it is only in the third person singular forms that there is a distinction made between animate and inanimate nouns. The plural adjective agreement suffixes, demonstratives and object enclitics are the same for both noun classes. See 3.1.3 below for the distinction in pronominal enclitics, and see section 3.2 for the distinction in adjectival and numeral agreement.

The deictic system is very complicated and beyond the scope of this introduction. Suffice to say that when demonstratives occur with certain specialised pronominals as the head of the noun phrase, if the noun that the pronominal replaces is animate, the demonstrative is chosen from the set *nay* (near speaker), *ne* (mid distance or near addressee), *no* (far away), or *niʔa* (in focus not visible); where the noun replaced is inanimate, the demonstratives are *wa*, *re*, *no* or *riʔa* respectively. It will be seen below (3.1.3) that these demonstratives are also used as third person singular free pronouns, and in this usage too, the distinction between animate and inanimate nouns is maintained.

### 3.1.2 Possessive constructions

#### 3.1.2.1 Inalienable possession

There is a closed subset of nouns which under normal circumstances must be possessed. These nouns include most body parts, most relationship terms, and many locational nouns, such as ‘the underneath’, ‘the top’, ‘the inside’, etc. Possession is marked with obligatory possessive suffixes. The following is the paradigm of possessive suffixes, although there is considerable variation in the third person singular forms.

1sg	2sg	3sg	1pl incl	1pl excl	2pl	3pl
-ŋu	-m	last vowel of root > <i>i</i>	-da	-ʔama	-ʔami	-di

Variations in the third person singular include the adding of *-y* root finally, the changing of the final root vowel to *e* instead of *i*, and in some cases almost unrecognisable root changes, such as the root *mata-* ‘eye’ becoming *mayi* ‘his eye’, or the root *yak<sup>w</sup>a-* ‘spouse’ becoming *yasi* ‘his/her spouse’.

#### 3.1.2.2 Alienable possession

Nouns which do not belong to the set of inalienably possessed nouns are possessed by being immediately preceded by a possession word, which does not carry stress when it precedes the noun, but can occur alone with the meaning of ‘mine’, ‘yours’, ‘his’, etc., in which case it has final stress. The following is a paradigm of the possession words.

1sg	2sg	3sg	1pl incl	1pl excl	2pl	3pl
ʔana	ʔamu	ʔani	ʔada	ʔama	ʔami	ʔada

### 3.1.3 Pronominals

There is a set of free pronouns which may occur as subjects or objects. In both positions their presence brings the subject or object into higher prominence, the unmarked forms being (a) the absence of a free pronoun as subject – person and number are indicated by the obligatory verbal inflection prefix – and (b) the use of object enclitics. The free pronouns are as follows:

1sg	2sg	3sg	1pl incl	1pl excl	2pl	3pl
<i>saʔu</i>	<i>ʔa</i>	<i>nay, wa</i> (near)	<i>ʔita</i>	<i>ʔemi</i>	<i>ʔemi</i>	<i>wadi</i> (near)
		<i>ne, re</i> (mid)				<i>de</i> (mid)
		<i>no</i> (far)				<i>do</i> (far)
						<i>ʔiri</i> (general)

## 3.2 Adjective and numeral agreement

### 3.2.1 Adjectives

Adjectives agree with the noun they qualify for person and number; they take agreement suffixes, as in the table that follows. When adjectives qualify third person singular inanimate nouns, the agreement suffix is a zero morpheme indicated below by the symbol  $\emptyset$ . For certain adjectives there is also a change of the final root vowel to *i*.

1sg	2sg	3sg	1pl incl	1pl excl	2pl	3pl
<i>-ŋu</i>	<i>-ʔa</i>	<i>-ni</i> (anim.)	<i>-da</i>	<i>-ʔama</i>	<i>-ʔami</i>	<i>-ye</i>
		$\emptyset$ (inanim.)				

### 3.2.2 Numerals

When numerals qualify inanimate nouns they take no affixation, thus *k<sup>w</sup>alar ʔawa* means ‘four houses’. When they qualify animate nouns a distinction is made between human and non-human; for non-human animate nouns the numerals two to nine take a prefix *ʔay-* (or sometimes *ʔa-*), thus *man ʔay-ʔawa* means ‘four birds’. For human nouns numerals take a suffix which agrees with the noun for person and number. These suffixes are the same as the suffixes for adjectival agreement, except that I have not encountered first or second person singular forms. Thus *ʔodarʼbu ʔawa-ye* means ‘four women’, *lay-da* means ‘the three of us (incl.)’, and *ʔawa-ʔami* means ‘the

four of you'. *Ye* 'one' takes the third person singular suffix *-ni* with all animate nouns, whether human or not, and likewise *wur* 'ten' becomes *wu'raɸi* with all inanimate nouns. The following table shows the various forms of the numerals 1 to 10.

With inanimate nouns:

*ye/ʔe'tu, ro, lay, ʔawa, 'lima, 'dubu, dubu'yam, ʔa'ro, yera, wur.*

With non-human animate nouns:

*'yeni, ʔay'roy, ʔay'lay, ʔay'awa, ʔay'lima, ʔay'dubu, ʔaydubu'yam, ʔaʔa'ro, ʔa'yera, wu'raɸi.*

With human animate nouns (3rd person):

*'yeni, 'roye, 'laye, ʔawaye, 'limaye, 'dubuye, dubu'yame, ʔa'roye, 'yeraye, wu'raɸi.*

### 3.3 Verb morphology

#### 3.3.1 Inflectional prefixes

The inflectional prefix on the verb marks the person and number of the grammatical subject. It has the following forms which occur when the verb root has initial stress and the prefix *r-* does not occur:

Person:	First	Second	Third
Singular:	<i>ʔu-</i>	<i>m-</i>	<i>ʔa-</i>
Plural:	<i>ta-</i> (incl)	<i>mi-</i>	<i>da-</i>
	<i>ma-</i> (excl)		

There is an allomorph set as follows whose members occur with verb roots with non-initial stress, or before the prefix *r-*.

Person:	First	Second	Third
Singular:	<i>ʔo-</i>	<i>mo-</i>	<i>na-</i>
Plural:	<i>ta-</i> (incl)	<i>mina-</i>	<i>da-</i>
	<i>ma-</i> (excl)		

The following are examples of the different allomorphs:

<i>ʔa-bana</i>	‘he leaves’
<i>na-baʔarum</i>	‘he sinks’
<i>na-r-boy</i>	‘he is tired’

### 3.3.2 The prefix *r-*

In some circumstances a prefix *r-* occurs immediately before the verb root and after the inflectional prefix (which is then taken from the second allomorph set – see above). This occurs in three different circumstances:

- (1) Transitive verbs: object deletion. A transitive verb may have the object deleted in order to shift the focus from the object to the activity to which the verb refers. When this happens the prefix *r-* is obligatory. This use may be illustrated by the following two sentences. In the first the focus is on the fact that the dog bites people, as opposed to, for example, other dogs. In the second sentence the focus is on the action of biting, so the object is deleted and the *r-* is inserted:

*k<sup>w</sup>oyar ne ʔa-ʔara tamatu.*  
 dog that 3sg-bite people  
 ‘That dog bites people.’

*k<sup>w</sup>oyar ne na-r-ʔara.*  
 dog that 3sg-R-bite  
 ‘That dog bites.’

- (2) Transitive verbs: co-referential object. When the object of a transitive verb is co-referential with the subject, either with a reflexive meaning or with a reciprocal meaning, the object is represented by a pronominal object enclitic, and the prefix *r-* is inserted. See the difference of meaning in the following three examples:

*ʔa-dayar-ni* ‘He hit him (someone else)’  
*na-r-dayar-ni* ‘He hit himself’  
*da-r-dayar-ye* ‘They hit each other (or: themselves)’

What these two functions of *r-* seem to have in common is that they decrease the valency of the verb, either by deletion of the direct object, or by the direct object becoming co-referential with the subject. For a very relevant discussion of this see Comrie (1985: 319-320). I am therefore calling *r-* a valency-decreasing prefix.

- (3) When *r-* is determined by the lexicon. The third and final occurrence of the prefix *r-*, is a non-productive one. It is simply that the lexicon requires that certain verbs always have *r-*. There are a limited number of such verbs. Most such verbs are intransitive, e.g. *na-r-laʔa* ‘he knows’, *na-r-tir* ‘he bathes’, but there are so far two examples of transitive verbs, e.g. *na-r-naw-ʔa* ‘he teaches you’, and *na-r-sile-ʔa* ‘he pities you’.

### 3.3.3 The prefix *ser-*

Verb roots may take the prefix *ser-*. This prefix has a number of different functions, sometimes class changing, but often the resulting form is analysable in terms of a non-finite verb.

- (a) Occasionally *ser-* forms a noun, thus *ser-'siɸar* ‘language’ is formed from the verb root *-siɸar* ‘speak’.
- (b) A more common use is to form a qualifier for a noun, *ʔay ser-'waw* ‘firewood’ is formed from the root *-waw* ‘burn, bake’, literally meaning ‘wood for burning’. It will be noted, however, that the same word *ser-'waw* has a different meaning in *siʔa ser-'waw* ‘baked fish’, literally ‘fish that has been baked’. Similar is *ʔu'der ser-'lesi* ‘domesticated cassowary’, literally ‘a cassowary that has been domesticated’.
- (c) *Ser-* is also often used to form a verbal noun, the equivalent of the English gerund (‘running’ as in ‘running is fun’). See the examples below (NF = non-finite):

<i>ʔu-'bana</i>	<i>ser-'num</i>	compare:	<i>ʔa-num</i>
1sg-go	NF-dive		3sg-dive
‘I’m going diving.’			‘He dives.’

<i>ʔani</i>	<i>ser-'siɸar</i>	<i>ʔuwatu</i>
3sgPoss	NF-speak	plenty
‘He talks a lot (lit. his talking is plentiful).’		

It will be noted that in the above example *ser-siɸar* does not mean ‘language’ as in (a) above, but is a gerund-like form of *na-r-siɸar* ‘(he) speaks’. These words formed with *ser-* act like nouns; in the above examples both words could be replaced by any noun that would fit the context.

### 3.3.4 Irregular verbs – portmanteau affixation

Certain verbs in *Dobel* act in an irregular manner, in that the inflectional prefix merges with the root, resulting in a one- or two-syllable form which incorporates both the prefix and the root. The combined forms all have initial stress (except in the second person plural because of a two-syllable underlying prefix), which tends to indicate that an underlying root with initial stress has merged with *na-* type prefixes. There are seven verbs of this type:

	1sg	2sg	3sg	1p excl	1pl incl	2pl	3pl
'drink'	<i>ʔon</i>	<i>mon</i>	<i>nan</i>	<i>man</i>	<i>tan</i>	<i>mi'nan</i>	<i>dan</i>
'sleep'	<i>ʔon</i>	<i>mon</i>	<i>nen</i>	<i>men</i>	<i>ten</i>	<i>mi'nen</i>	<i>den</i>
'cause/do'	<i>ʔom</i>	<i>mom</i>	<i>nam</i>	<i>mam</i>	<i>tam</i>	<i>mi'nam</i>	<i>dam</i>
'take/give'	<i>ʔol</i>	<i>mol</i>	<i>nal</i>	<i>mal</i>	<i>tal</i>	<i>mi'nal</i>	<i>dal</i>
'say/do next'	<i>ʔonʔay</i>	<i>ʔomʔay</i>	<i>ʔonʔay</i>	<i>ʔomʔay</i>	<i>ʔonʔay</i>	<i>mi'ʔonʔay</i>	<i>ʔonʔay</i>
'hold'	<i>ʔodi</i>	<i>ʔodi</i>	<i>ʔodi</i>	<i>ʔodi</i>	<i>ʔodi</i>	<i>mi'ʔodi</i>	<i>ʔodi</i>
'take'	<i>ʔoʔu</i>	<i>ʔomʔu</i>	<i>ʔonʔu</i>	<i>ʔomʔu</i>	<i>ʔonʔu</i>	<i>mi'ʔonʔu</i>	<i>ʔonʔu</i>

## 4 Reduplication

*Dobel*, in common with the other languages in *Aru*, has a complex reduplication system. Reduplication has many morphological and syntactic functions and also has a lexical function. It has two forms phonologically, although one is far more common than the other.

### 4.1 The phonological forms of reduplication

The two forms of reduplication are firstly prefixing reduplication of the syllable core of the stressed syllable (CV- reduplication) and secondly prefixing reduplication of the syllable onset of the stressed syllable (C- reduplication). The first of these, CV- reduplication, is only present when the reduplication has a purely lexical function and only when the initial syllable is stressed. This form of reduplication only occurs on nouns. CV- reduplication may always be optionally replaced with C- reduplication, thus:

CV-	C-	
<i>k<sup>w</sup>a-k<sup>w</sup>asa</i>	<i>kk<sup>w</sup>asa</i>	‘crocodile’
<i>tí-tím</i>	<i>ttim</i>	‘sp. of bird’
<i>ʔa-ʔáw</i>	<i>ʔʔaw</i>	‘butterfly’
<i>sa-sár</i>	<i>ssar</i>	‘sandfly’
<i>tu-tún</i>	<i>ttun</i>	‘mosquito’

Secondly, there is C- reduplication which is a reduplication of the initial consonant of the stressed syllable (all syllables are consonant-initial in Dobel). It is manifest phonologically as a fortis lengthened initial consonant on the stressed syllable. This phonological form of reduplication has not yet been found in any other languages of Aru. The reduplication constitutes in fact a separate morpheme (e.g. *ʔaylláw* ‘papaya’). For convenience in this introduction and in the wordlist I will not show it hyphenated as separate, but simply written as a double consonant. The following are some examples of C- reduplication showing the unreduplicated form in parentheses:

<i>yyakur</i>	<i>(yakur)</i>	‘sago-pounder’
<i>ʔʔula</i>	<i>(ʔula)</i>	‘sandy’
<i>kubból</i>	<i>(kuból)</i>	‘of the forest’
<i>sernnúm</i>	<i>(sernúm)</i>	‘diving’

## 5 Notes on the Dobel wordlist

### 5.1 Loan words

Loan words are signalled by square brackets in the list and their source is indicated in the footnotes, where known. An indication that a word is a Malay borrowing means that it has been borrowed from Aru Malay, the local Malay dialect spoken in the Aru Islands. Aru Malay is similar to Ambonese Malay, but has some differences.

### 5.2 Grammatical forms used in the wordlist

**Verbs:** Verbs are given in the third person singular form.

**Adjectives:** Adjectives are given in the form they take when they agree with third singular inanimate nouns (i.e. no suffix), unless they only qualify animate nouns, in which case they are cited with the third singular animate agreement suffix *-ni* or *-n*. Also, where there is a vowel root change in the

## 38. Irarutu

---

---

**Contributor:**

Wordlist and Introduction: *C. L. Voorhoeve*

---

---

### 1. Introduction

---

---

Irarutu is spoken by 5000 – 6000 people living in the centre of the Bomberai Peninsula, southwest Irian Jaya, and its eastern interior up to the watershed which separates the rivers flowing into Bintuni Bay from those flowing into Cenderawasih Bay. The language belongs to the South Halmahera – West New Guinea subgroup of the Austronesian languages (Blust 1978) but seems to occupy an isolated position in it (Voorhoeve 1989).

Irarutu speakers themselves distinguish seven variants in their language on the basis of lexical differences and differences in *rimia*, a local term covering intonation, stress patterns, speed of speech, and differences in the realisation of segmental phonemes. The seven variants are:

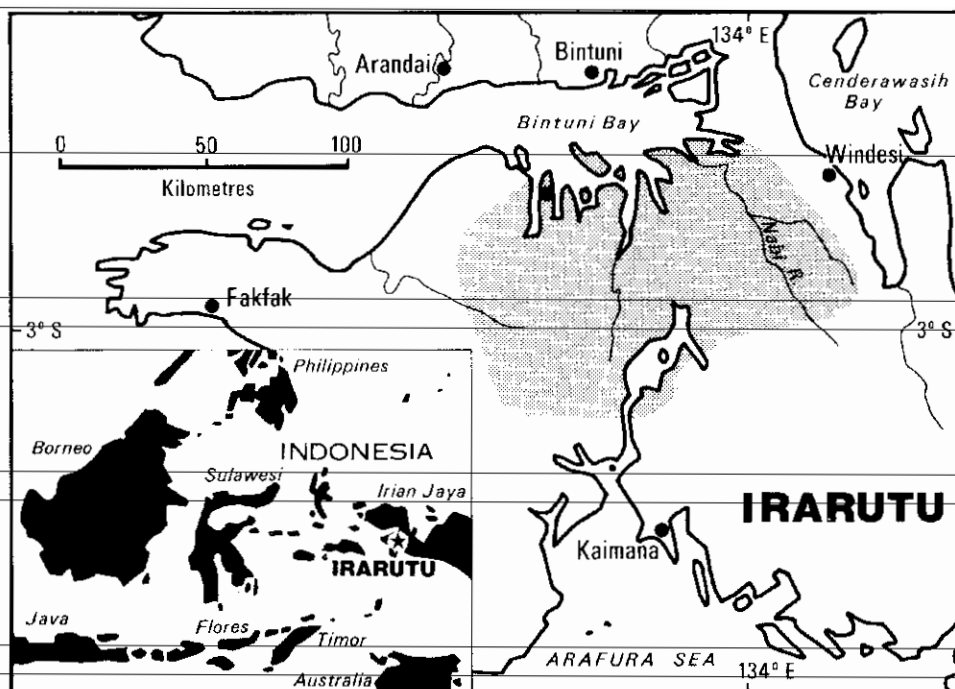

1. Nabi, spoken in the valleys of the Nabi and Kuri rivers, and on the Wagura river. In the Nabi villages on the Wagura river also the Babo variant is spoken.
2. Babo, spoken on the Wagura river (see above), on the lower Kaitero river and in Babo, the administrative centre of the Babo sub-district.
3. Kasuri, spoken on the Kasuri river and in Tomage village.
4. Fruata, spoken in the environments of the R.C. Mission station Fruata and in a number of villages south of it, down to Werefuta on the lower Gono river.
5. South-Arguni, spoken along the western, southern, and eastern shores of Arguni Bay.
6. East-Arguni, spoken along the northeastern shore of Arguni Bay.
7. North-Arguni, spoken in a few villages at the northern tip of Arguni Bay.

A considerable number of Irarutu speakers, mostly from the Arguni Bay area, are now living in the township of Kaimana and the nearby villages Tiowa and Kroi.

---

---

The wordlist presented here represents the Fruata variant. I collected it during short stays in Worofuta village and Kaimana, in August 1986. In Werefuta Mr Marius Durye, primary school teacher, and Mr Gerard Kiruwa helped me to compile the 1200-item list and grammatical notes. In Kaimana a Catholic deacon, Damianus Surinde from Mariedi village, gave me additional lexical and grammatical information. To all of them I express here my sincere thanks for their generous help.

Map 38. Irarutu language area

## 2. Some notes on the Fruata variant

The inventory of the consonant phonemes is:

Table 1. Irarutu consonants

	Bilabial	Dental/Alveolar	Velar
Stops	v	<i>p</i>	<i>t</i>
	vd	<i>b</i>	<i>d</i>
Fricatives		<i>ɸ</i>	<i>s</i>
Nasals		<i>m</i>	<i>n</i>
Flaps			<i>r</i>
Semivowels		<i>w</i>	<i>y</i>

/p/, /k/, /m/, /n/, /s/ and /w/ have their usual phonetic values. /t/ and /d/ have dental and interdental realisations. /b/, /d/, and /g/ are often prenasalised in word-initial position; word-medially and finally they are always prenasalised, with voiced and unvoiced stop allophones [b, <sup>m</sup>b, <sup>m</sup>p], [d, <sup>ɲ</sup>d, <sup>n</sup>d, <sup>n</sup>ɖ, <sup>n</sup>t, <sup>n</sup>ʈ], [g, <sup>ŋ</sup>g, <sup>ŋ</sup>k].

/ɸ/ is a bilabial fricative; in initial and final positions it is always unvoiced, intervocalically sometimes voiced. In initial position sometimes a weak bilabial affricate is found; hence the allophones are [ɸ, Pɸ, β].

/r/ is a flapped vibrant, in word-final position sometimes unvoiced [ř, R]. A trilled vibrant also occurs, but only as an alternative realisation of the sequence [řř], = /rr/.

/y/ is a palatal fricative with strong friction, alternating with a palatal affricate.

/w/ and /y/ occur word-initially only (non-initial [w] and [y] have been analysed as non-syllabic /u/ and /i/ respectively). All other consonant phonemes are found word-initially, medially, and finally.

In word-final position preceding a pause, a consonant is always followed by a weak vocalic release. Usually this is a mid-central vowel [ə], but it can also be a weak echo-vowel, e.g. /sus/ = [su:s<sup>ə</sup>], [su:s<sup>u</sup>], 'breast'.

There seem to be seven vowel phonemes:

Table 2. Irarutu vowels

	Front	Central	Back
High	i [i]		u [u, ŭ ũ]
Mid	e [ɛ, ê]		o [ɔ̃, ô, o]
Low	ɛ [ɛ̃, ε]	a [a, æ, ɑ]	ɔ [ɔ]

In addition there is what seems to be a non-phonemic mid-central vowel [ə] which occurs predictably at the end of words (see above) and as an automatic separator of consonant phonemes when two consonants within a word are not separated by one of the vowel phonemes. Thus: [ɔ məsə<sup>m</sup>be<sup>ŋ</sup>gətə ɸa'nɛ] /ɔ msbegt ɸanɛ/ 'you you-shot (the) pig'. The only consonant sequences which do not require the presence of a separator are those consisting of a voiced stop (or /ɸ/), and /r/: /br, dr, gr, ɸr/.

Stress is phonemic as shown by [ɔʔɔ <sup>ŋ</sup>gata] 'who (are) you?' – [ɔʔɔ <sup>ŋ</sup>ga 'ta] 'you eat shit'. In words with more than one vowel phoneme however the last vowel usually carries the stress: ɸa'nɛ 'pig'.

### 3. Orthography

A strictly phonemic spelling results in written words which can contain long sequences of consonants. A non-phonemic [ə] will be written when it separates two consonants. In polysyllabic words stress will be marked when it is not on the last vowel (the consonant separator ə, although written, is ignored because it is not a phonemic vowel).

### 4. Verbs

Transitive and intransitive action verbs are marked for person of agent only. Maximally 1st, 2nd, and 3rd persons are distinguished; the markers are prefixed. With stems that do not trigger morphophonemic changes these markers are:  $\emptyset$ - 'I, we'; *m*- 'you (sg, pl)'; *n*- 'he, she, it; they'. Such verb stems have an initial vowel, *t* (if followed by a stressed vowel), *k*, *d*, *g*, *n*, *r*, or *y*.

	1	2	3
'blow'	<i>uɸ</i>	<i>m-uɸ</i>	<i>n-uɸ</i>
'peel'	<i>dadən</i>	<i>mə-dadən</i>	<i>nə-dadən</i>

Morphophonemic changes occur if a verb stem begins with one of the following consonants: *t* (not followed by a stressed vowel), *ɸ*, *b*, *m*, or *s*.

*n*- + stem-initial *t*: > *d*

'spit'	<i>təɸe</i>	<i>mə-təɸe</i>	<i>dəɸe</i>
--------	-------------	----------------	-------------

*m*- + stem-initial *f*: > *b*

'go'	<i>ɸa</i>	<i>ba</i>	<i>nə-ɸa</i>
------	-----------	-----------	--------------

*m-* + stem-initial *b*: >*b*

‘laugh’    *bariɸ*    *bariɸ*    *nə-bariɸ*

*m-* + stem-initial *m*: > *m*

‘stand’    *mərir*    *mərir*    *nə-mərir*

*n-* + stem-initial *s*: > *s*

‘return’    *su*    *mə-su*    *su*

The following verbs are irregular, having *g-* marking 1st and 2nd person, and *n-* marking 3rd person:

	1/2	3
‘sleep’	<i>gen</i>	<i>nen</i>
‘drink’	<i>gin</i>	<i>nin</i>
‘eat’	<i>ga</i>	<i>na</i>

The aspect markers *bu* ‘completive’, *do* ‘progressive’, and the mode marker *ga* ‘intention’ precede the verb.

## 5. Personal/possessive pronouns

The basic forms of the pronouns can function as personal and as possessive pronouns. Only with 1sg we find two forms one of which does not occur as a possessive pronoun:

Sg	1	<i>ya, a</i>
	2	<i>ɔ</i>
	3	<i>i</i>
Pl	1 incl	<i>it</i>
	1 excl	<i>am</i>
	2	<i>ε</i>
	3	<i>ir</i>

The form *ya* functions as subject and object. *a* occurs as a possessive pronoun but can also function as subject. Thus: *a waməs* ‘my blood’, *ya maməs* ‘I am red/bloodied’, *ya/a gene si* ‘I dream saw’ = ‘I dreamt’.

There are derived forms marked by a suffix *-rɔ* (emphatic, focal), *-ri* (possessive, used predicatively) and *-ririɔ* (emphatic variants of the *-ri* forms): *yarɔ* ‘I’, *yari* ‘mine’, *yarirɔ* ‘mine’ (emphatic).

## 6. The possessive noun phrase

In the possessive noun phrase the head noun is preceded by the possessive pronoun. Normally the head noun is not morphologically marked for possession; exceptions are nouns referring to body parts, “names”, and at least one kin term. All of these take possessive suffixes indicating the person of the possessor. They are:

1 pers	:	-g, -ug, -og
2 pers	:	-m, -um, -om
3 pers	:	-∅

For example:

*φra* ‘arm’ – (a, it, am) *φrag* ‘(my, our) arms’ – (ɔ, ε) *φram* ‘your arms’  
 – (i, ir) *φra* ‘his/her, their) arms’.  
*rit* ‘skin’ – (a, it, am) *ritug* – (ɔ, ε) *ritum* – (i, ir) *rit*.  
*ta φad* ‘elder sibling, same sex’ – *a tag φad* ‘my elder brother/sister’

When the possessor is referred to by a noun there are two possibilities: either a noun – noun construction in which N<sub>1</sub> is the possessor and N<sub>2</sub> the possessed, or a noun – possessive pronoun 3p – noun construction:

*fra si* ‘arm joint, elbow’; *a die san / a die i san* ‘my father’s house’.

## 7. Word order

Irarutu is an S V O language. Noun modifiers and numerals follow the noun. Some nouns require a numeral classifier when counted:

<i>mɔ kɔsi</i>	‘child small’ = ‘a small child’
<i>omage φu eso</i>	‘coconut fruit one’ = ‘one coconut’
<i>φane tɔni eso</i>	‘pig body one’ = ‘one pig’

Some additional information on the Irarutu language can be found in the short sketch by the author published in the journal *Irian* (Voorhoeve 1989).

Other publications which contain data on Irarutu are Cowan (1953), Anceaux (1958, 1961); Voorhoeve (1975), Blust (1978), Barr – Barr (1978).

## 39. Sawai

---

---

<b>Contributors:</b>
----------------------

Introduction and Wordlist: <i>Ronald Whisler -- Jacqui Whisler</i>
--

---

---

### 1. Introduction

---

Sawai is spoken along the coast of south Halmahera between the southern and southeastern peninsulas in the northern part of the province of Maluku, eastern Indonesia (see map). Sawai speech varieties chain from the eastern-most village of Mesa, to the southern-most village of Mafa, in the Gane Timor subdistrict. Villages that are close in geographic proximity are generally also highest in lexical similarity. In addition, villages that share the same dominant religion (i.e. Islam or Christianity), though they are geographically separate, share vocabulary that is not shared by villages of the other religion.

Sawai, sometimes referred to as the Weda language, is spoken by approximately 12,000 people.

Data for the present word list were recorded in the villages of Lelilef Serani and Kobe Peplis, where the authors have lived for a period of twelve months.<sup>1</sup> Our primary informants were Yulius Burnama, Librek Badengo, Wilhelmus Badengo, Samsudin Bane and Etelina Badengo.

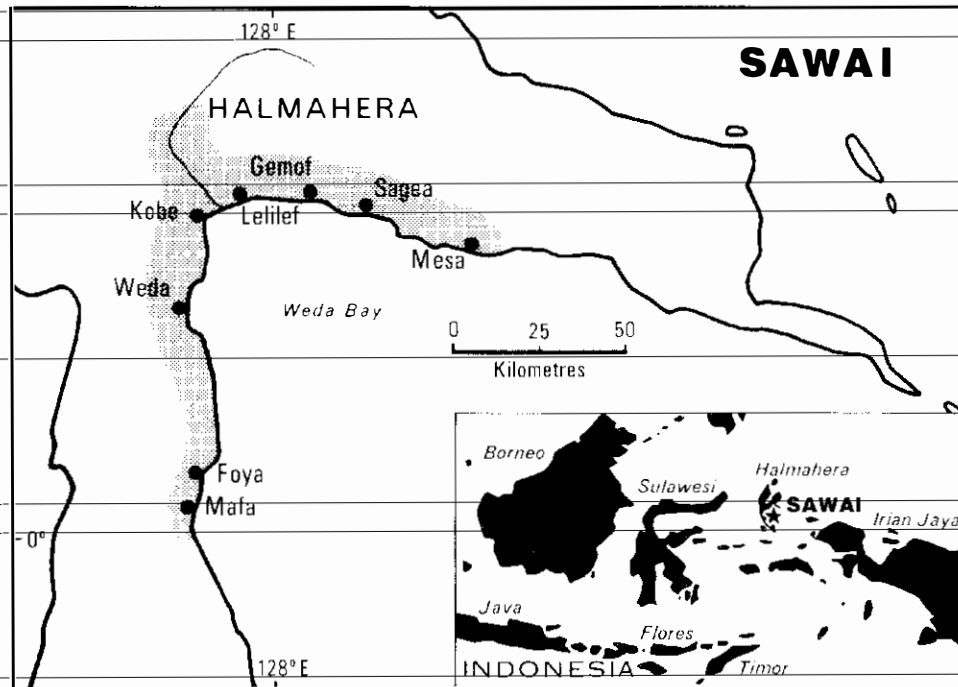

Items listed as borrowings from Malay refer to North Moluccan Malay (see Voorhoeve 1983, Taylor 1983), the *lingua franca* of the area, not to Standard Indonesian. Because of the historical dominance in the region of the sultanates of Ternate and Tidore, there has been considerable lexical borrowing from the non-Austronesian North Halmaheran languages of Ternate, Tidore and Tobelo. The linguistic differences between the Ternate language and the Tidore language are minimal, making it difficult to distinguish the particular source of some loan words. Furthermore, the non-Austronesian languages of North Halmahera have themselves borrowed

---

1. The fieldwork was conducted as part of a cooperative effort between Pattimura University and the Summer Institute of Linguistics under the auspices of the Department of Education and Culture of the Republic of Indonesia. We wish to thank both the Government of Indonesia, our sponsoring University, and our many Sawai friends who have so graciously shared their lives with us.

---

heavily from Austronesian languages, such as Sangir and Malay, and some of these Austronesian loans have come into Sawai via non-Austronesian languages. Thus, the picture of contact-induced language change in Sawai is complex, involving both non-Austronesian languages and Austronesian languages of different higher-order subgroups.

Map 39. Sawai language area.

The Sawai language, included under Blust's (1978) classification as a South Halmahera-West New Guinea language, has received scant attention in the literature. Sawai directionals are discussed briefly by Shuji Yoshida in his survey of Galela and other North Halmaheran directionals (1980). Michael R. Thomas, after fieldwork in the village of Kobe Gunung, published a brief sketch of Sawai pronominal proclitics (1983). In addition, a Pattimura University research team has drafted a Sawai grammar sketch. The most complete description of a related South Halmaheran language is by Maan (1940, 1951) for the Buli language.

## 2. Summary of the phonology

### 2.1 Word Stress

Words are stressed on the penultimate syllable of the root.

(1)	/baŋa/	['baŋa]	'forest'
	/yεget/	['yεget]	'oil'
	/lεgæ/	[lε'gæ]	'man'
	/mafyanes/	[ma'fyanes]	'hot'

However, when the penultimate vowel is a mid front lax vowel /ε/ and the final vowel is other than /ε/, the stress falls on the ultimate syllable.<sup>1</sup>

(2)	/musɛla/	[musɛ'la]	'woven mat'
	/lɛlit/	[lɛ'lit]	'mango'
	/lɛlɔ/	[lɛ'lɔ]	'blood'
	/dɛlut/	[dɛ'lut]	'parents'

## 2.2 Inventory of consonants

Sawai has fifteen consonant phonemes.

Table 1. Sawai consonants

		Labial	Alveolar	Palatal	Velar
Stops	vl	<i>p</i>	<i>t</i>		<i>k</i>
	vd	<i>b</i>	<i>d</i>		<i>g</i>
Fricatives		<i>f</i>	<i>s</i>		
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>
Laterals			<i>l</i>		
Flaps			<i>r</i>		
Semivowels		<i>w</i>		<i>y</i>	

The /w/ is a semivowel, but becomes a fricative [β] when preceding a liquid or the lax vowel /ε/. The /r/ is a flap, but may become a trill when following a consonant.

The /s/ and /y/ have the allophones [č] and [j] respectively. When the /s/ is preceded by a non-liquid alveolar or when /y/ is preceded by a voiced alveolar stop, either between or across word boundaries, they are affricated and palatalised. [č] and [j] do occur with low frequency in other

1. We have indicated stress in the wordlist when stress does not follow the rules mentioned above. The majority of such forms probably reflect reduplication with the root retaining the stress when the reduplicated syllable is added before it.

environments, but due to this limited frequency we have analysed them phonemically as sequences of /ts/ and /dy/ respectively.<sup>1</sup>

All consonants occur in syllable-initial position. The /d/ never occurs syllable finally, or initially in a consonant cluster. /h/ is only found in borrowed words from the surrounding non-Austronesian languages or Malay.

### 2.3 Inventory of vowels

Sawai has eight vowel phonemes

*Table 2.* Sawai vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid-high	<i>e</i>	<i>ə</i>	<i>o</i>
Mid-low	<i>ɛ</i>		<i>ɔ</i>
Low		<i>a</i>	

/ɛ/ is phonetically a mid, front, lax, unrounded, vowel. /ɔ/ is a mid, back, lax, rounded vowel. In an open syllable that precedes the stressed syllable, /ɛ/ sometimes neutralises with central vowel /a/. The mid vowels /ɛ ɔ/ tend to act as low vowels in terms of morphophonemics.<sup>2</sup>

### 2.4 Syllable and Word Structure

The minimal structure for a single syllable is V, while the maximal is CCVC.

(3)	V	<i>i</i>	‘he, she, it’
	VC	<i>in</i>	‘fish’
	CV	<i>fa</i>	‘sting ray’
	CVC	<i>yof</i>	‘sago’
	CCVC	<i>kmɔn</i>	‘axe’

1. They are written *ç* and *ʝ* respectively in the wordlist because of uncertainty as to their status.
2. The mid-high vowels /e o/ occur with low frequency, but sufficient to establish contrast with /ɛ ɔ/. However, their phonemic status is regarded as provisional.

CV.CVC and CV.CV are the most common word structures, though mono- and tri-syllabic words also occur. The longest word found consists of five syllables.

Consonant clusters occur not only within the syllable but also across syllable boundaries. Vowel sequences occur word medially and finally.

### 3. Morphology and morphophonemics

Verbs take the following pronominal prefixes:

Table 3. Sawai pronominal prefixes

Singular		Plural	
<i>k-</i>	1st person	<i>k-</i>	1st person exclusive
		<i>t-</i>	1st person inclusive
<i>m-</i>	2nd person	<i>f-</i>	2nd person
$\emptyset$	3rd inanimate	<i>r-</i>	3rd inanimate

In combination with the pronominal prefixes, verbs can also take the following affixes:

Table 4. Sawai verbal affixes

Prefixes		Suffixes	
<i>fa-</i>	causative	<i>-o</i>	location focus
<i>t-</i>	accidental, passive	<i>-e</i>	paragoge, instrument focus
<i>m-</i>	stative		
<i>n-</i>	progressive/habitual		

A subgroup of body parts and kinship terms (inalienable possession) take a possessive enclitic. These enclitics are as follows:

Table 5. Sawai genitive enclitics

Singular		Plural	
<i>-g</i>	1st person	<i>-mam</i>	1st person exclusive
		<i>-r</i>	1st person inclusive
<i>-m</i>	2nd person	<i>-f</i>	2nd person
$\emptyset$	3rd person	<i>-ri</i>	3rd inanimate

The paragoge /-ε/ is added to consonants just before a temporary pause, or just before the end of the clause. In general, Sawai tends to end the phonological sentence with a CV syllable.

(4)	<i>um</i>	~	<i>umε</i>	'house'
	<i>mekot</i>	~	<i>mekote</i>	'red'
	<i>āy</i>	~	<i>āyε</i>	'wood'
	<i>aw</i>	~	<i>awε</i>	'2sg, you'

A voiced stop assimilates to the voicelessness of a following voiceless stop.

(5)	<i>tεb+tuβo</i>	[tεp'tuβo]	'the top'
	<i>tεb+tibe</i>	[tεp'tibe]	'supporting beam'
	<i>n-tεg+tig</i>	[ntεk'tig]	'3sg-to hop'
	<i>n-fab+sobe</i>	[nfap'sobe]	'3sg-recip-hang'

Geminate clusters can occur when either proclitics or reduplicative morphemes precede a verb root. When such a cluster occurs, the two identical consonants reduce to one.

Geminate reduction from pronominal proclitics:

(6)	<i>t-telote</i>	>	<i>telote</i>	'1pl incl +hungry'
	<i>m-mesie</i>	>	<i>mesie</i>	'2sg-to care for, to love'

Geminate reduction from reduplication:

(7)	<i>tεt-titef</i>	>	<i>tεtitef</i>	'spittle'
	<i>kεk-kaket</i>	>	<i>kεkaket</i>	'wood beam used to lock door'

Nouns are derived from verbs by reduplicating the first two consonants of the verb root, interposed by the mid front lax vowel /ε/. The nominalisation reduplication formula is:

(8)	$C_1εC_2$ : NOM	+	<i>tolen</i>	to sit	>	<i>teltolen</i>	'chair'
-----	-----------------	---	--------------	--------	---	-----------------	---------

(9)	<i>lesen</i>	'to sweep'	>	<i>leslesen</i>	'sweeper'
	<i>titef</i>	'to spit'	>	<i>tεtitef</i>	'spittle'
	<i>n-εtibe</i>	'3sg-to stake'	>	<i>tεptibe</i>	'stake'

A reciprocal verb is marked by initial /fa-/ plus the reduplication of the second consonant of the verb root ( $C_2$ ). Thus:

(10)	<i>fa-C<sub>2</sub></i> +	<i>εηotɔ</i>	'to see'	>	<i>fateηotɔ</i>	'see one another'
	<i>fa-C<sub>2</sub></i> +	<i>gali</i>	'to help'	>	<i>falgali</i>	'help one another'
	<i>fa-C<sub>2</sub></i> +	<i>pitno</i>	'to tie'	>	<i>fatepitno</i>	'tie two things together'

## 40. Nyindrou

**Contributors:**Introduction : *Bill Martin*Wordlist : *Timothy Kundrake – Charles Kowak*

### 1. Introduction

The Nyindrou language (also known as Lindrou and Lindau) is spoken by about 2,550 people who live on the western end of Manus Island in Papua New Guinea. The main villages where Nyindrou is spoken are: Nyada, Jowan No.1, and Jowan No.2 on the north coast; Lessau, Nihon, Kalei and Saliyen on the west coast; and Bundrahi-Sapondralis, Likum and Korojih in the Malai Bay area of the south coast (see map). The villages in the Malai Bay area speak a mutually intelligible dialect of Nyindrou called “Babon”. Probably another 2,000 people speak or understand Nyindrou as a second language in the neighbouring language areas of Bipi, Sori-Harengan and Levei-Tulu.

Map 40. Nyindrou language area

Before 1980 very little linguistic description was undertaken in the Nyindrou language, other than brief word lists and samplings of grammatical features for purposes of comparative linguistic studies by such scholars as W.E. Smythe (1970) and R.A. Blust (1979). In 1980 the Summer Institute of Linguistics in cooperation with the Papua New Guinea Bible Translation Association conducted a sociolinguistic survey of Manus Province which included the Nyindrou language area. Since 1981 the author and his wife (Lenore Martin) have worked intermittently in the language area, residing at Lessau village, and working as advisors and consultants to Nyindrou national translators and literacy workers.<sup>1</sup>

## 2. Phonology

Below is a brief overview of the phonology of Nyindrou.

### 2.1 Inventory of consonants

Nyindrou has 22 consonant phonemes represented in Table 1:

*Table 1.* Nyindrou consonants

	Velarised labials	Labial	Alveolar	Palatal	Velar	Lab. Velars	Glottal
Stops	vɫ	<i>p</i> <sup>w</sup>	<i>p</i>	<i>t</i>		<i>k</i>	ʔ
	vɗ	<i>b</i> <sup>w</sup>	<i>b</i>	<i>d</i>	<i>ɟ</i>	<i>g</i>	<i>g</i> <sup>w</sup>
Prenasals			<i>n</i> <sup>d</sup>				
Fricatives			<i>s</i>				<i>h</i>
Nasals		<i>m</i> <sup>w</sup>	<i>m</i>	<i>n</i>	<i>ɲ</i>		
Laterals			<i>l</i>				
Flaps			<i>r</i>				
Semivowels		<i>w</i>		<i>y</i>			

1. We wish to thank the many Nyindrou people who have opened their homes to us and have shared with us their language and culture. Those involved most directly in the application of linguistics to their own language have been Timothy Kundrake, Charles Kowak, Robert Kowak (now deceased), Bernard Laban, Samuel Bolaubeu, Jonah Labanas, Matthew Kubwesau, Jessie Siraon, and the members of the Nyindrou Translation Committee. Those who contributed most to the present word list were Timothy Kundrake and Charles Kowak.

**2.1.1 Discussion.** The phonemes /p/, /p<sup>w</sup>/, /d/, /g/, and /g<sup>w</sup>/ are of relatively low frequency. /p/ and /t/ are lightly aspirated. /g/ and /k/ contrast only word initially. /<sup>n</sup>d/ is a prenasalised alveolar stop with flapped release. It occurs with great frequency and is very common in Manus languages. /ñ/ is a palatalised nasal which very clearly contrasts with /n/. There is no velar nasal in the language. /ɟ/ is only lightly voiced and has the quality of a palatalised stop. In the practical orthography the glottal stop is written as a hyphen, and only when it occurs word medially. In the present word list the glottal stop is represented as /ʔ/, with the hyphen representing morpheme breaks. /r/ is normally flapped, except in final position where it is a voiceless trill. Only /k/, /m/, /n/, /h/, /r/, /s/, /p/, /w/ and /y/ are found word finally.

## 2.2 Inventory of vowels

Nyindrou has five vowel phonemes:

Table 2. Nyindrou vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

In addition to the five basic vowels the following diphthongs may occupy the nucleus of a syllable: *ei*, *ai*, *oi*, *ui*, *eu*, *ou*, *au*, *iu*, *ae*, and *ao*. The diphthongs *ae* and *ao* occur with relatively low frequency.

**2.2.1 Discussion.** All the vowels are somewhat lengthened in stressed syllables. The back vowels /u/ and /o/ tend to be nasalised when contiguous to nasals. /o/ tends to be more open when contiguous to velars and glottals.

## 2.3 Word stress

Stress generally falls on the first syllable of multisyllable words. With verbs having modal/aspectual prefixes, the stress generally falls on the first stem syllable.

## 2.4 Notes on the shape of words and syllables

The possible syllable shapes in Nyindrou are V, CV, CVC, and VC. VC never appears in words of more than one syllable. Since there are no actual consonant clusters in the language, the syllable pattern of longer words is built on the formula (C) V (CV) ~ (C).

## 2.5 Notes on morphophonemic assimilation and vowel harmony

The first, second, and third person singular pronouns (*jo* 'I', *ou* 'you', and *iy* 'he/she/it') tend to fuse with vowel initial verbs, especially in rapid speech. the vowel of the first person singular pronoun *jo* 'I' tends to harmonise with a following vowel-initial verb. For example:

written form		moderate speech	rapid speech
<i>jo eme</i>	'I come'	[ʃe eme]	[ʃeme]
<i>jo udu</i>	'I stay'	[ʃu udu]	[ʃudu]
<i>jo ili</i>	'I go'	[ʃi ili]	[ʃili]
<i>ou amc</i>	'you come'	[owame]	[wame]
<i>ou ado</i>	'you stay'	[owado]	[wado]
<i>ou ala</i>	'you go'	[owala]	[wala]
<i>iy eme</i>	'he comes'	[iyeme]	[yeme]
<i>iy udu</i>	'he stays'	[iyudu]	[yudu]
<i>iy ili</i>	'he goes'	[iyili]	[yili]

The assimilation and vowel harmony illustrated above does not occur with consonant-initial verbs or when modal/aspectual prefixes exist on the verb.

Certain word classes having three or more syllables, such as the emphatic deictics and state verbs used to predicate physical attributes or conditions, tend to have a sort of vowel harmony in which each syllable maintains the same vowel quality. For example:

<i>kada-ah</i>	'right here (near)'
<i>kede-eh</i>	'right there (mid-range)'
<i>kodo-oh</i>	'right there (distant)'
<i>ñala-an</i>	'cold'
<i>ñarahan</i>	'hot'

Verbs having an ACTOR focus generally begin with a (low) vowel and may be of low or mid transitivity. Verbs having a GOAL focus generally end with /i/, /ei/, /nei/ or /ani/. For example:

<i>asak</i>	'be open'
<i>aseh</i>	'open up'
<i>sihi</i>	'open something'
<i>luhe</i>	'a curse/oath'
<i>aluhe</i>	'swearing'
<i>luhani</i>	'swear at someone'
<i>sihinen</i>	'price/cost'
<i>sisih</i>	'for sale'
<i>asih</i>	'buying/selling'
<i>sihinei</i>	'purchase/sell something'
<i>tarou</i>	'a design/text'
<i>atorou</i>	'draw/write'
<i>torowenei</i>	'engrave/publish something'
<i>tukum</i>	'a gathering'
<i>atukum</i>	'gather/gathering'
<i>tukum<sup>wi</sup></i>	'gather something together'

# 41. Manam

**Contributor:**

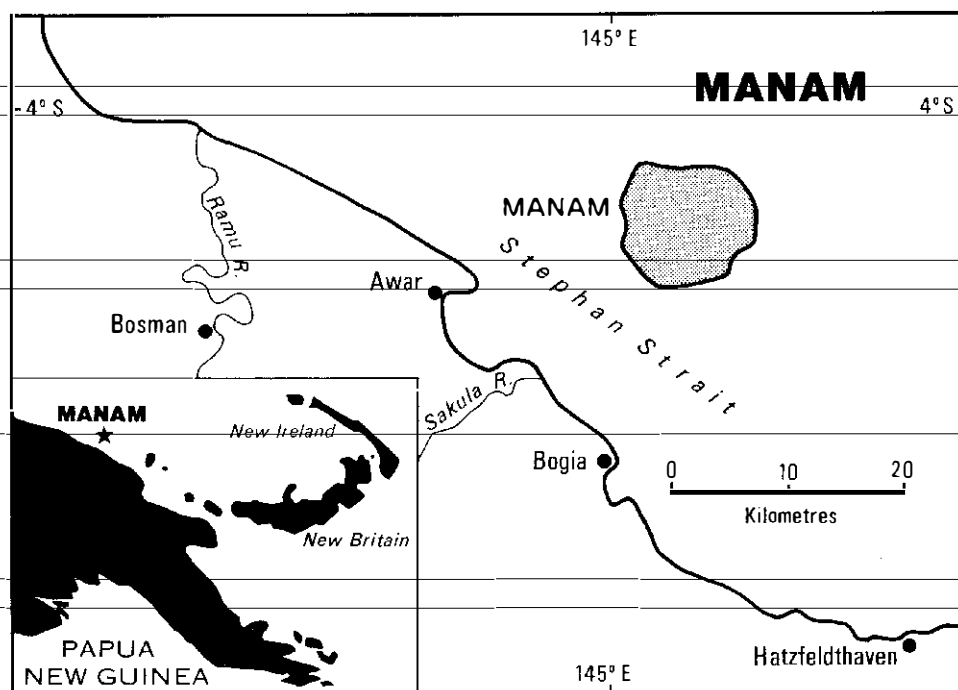

Introduction and Wordlist : *Blaine P. Turner*

## 1. Introduction

The Manam language is spoken by all the approximately 7000 people on Manam and Boesa Islands, Bogia District, Madang Province in Papua New Guinea. It is an Austronesian language in the Schouten Family. There is partial mutual intelligibility with its closest neighbour, Miem, spoken on Biem, Kadovar, Ruprup and Uei Islands to the Northwest. No major dialect divisions have been identified in Manam but some small regional phonological and lexical differences can be noted.

Some early work was done on the language by Wedgwood (1934) and Böhm (1975). Later Lichtenberk (1983) produced a complete grammar of Manam.

Data were recorded by the author over a period of three years in residence on Manam in Kuluguma Village beginning in September 1978. In addition

Map 41. Manam language area

to numerous informants from Kuluguma Village, Barnabas Manabung from Kolang Village reviewed the data for completeness and accuracy.

## 2. Summary of the phonology

Below is a brief overview of the phonology of Manam. A more complete treatment may be found in Turner (1986).

### 2.1 Word stress

Generally stress falls on the penultimate syllable of the word. If the ultimate syllable is closed, it will carry the stress.

- (1) *'mata* 'eye'  
*ma'tam* 'your eye'

A stress shift left is occasionally used to mark the singular number as in:

- (2) *udi go'ʔaŋ* 'eat the bananas'  
*udi 'go'ʔaŋ* 'eat the banana'  
*go'doʔi* 'get them'  
*'godoʔi* 'get it'

### 2.2 Inventory of consonants

Manam has 13 consonant phonemes.

*Table 1.* Manam consonants

		Bilabial	Alveolar	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>		<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives	vl		<i>s</i>		
	vd		<i>z</i>		
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Vibrants			<i>r</i>		

Phoneme	Allophones
/p/	[p <sup>h</sup> ]
/t/	[t <sup>h</sup> ]
/ʔ/	[ʔ] ~ [k <sup>h</sup> ]
/b/	[b]
/d/	[d]
/g/	[g] ~ [ɣ]
/s/	[s] ~ [ʃ]
/z/	[z] ~ [dʒ]
/m/	[m]
/n/	[n]
/ŋ/	[ŋ]
/l/	[l]
/r/	[r̥] ~ [r̄]

**2.2.1 Discussion.** Manam is undergoing a change from backed *k* to the glottal stop. The velar stops are still used only by older people in the Northeast quadrant of the island.

/m/, /n/ and /ŋ/ contrast in all positions except word final, where /n/ does not occur on the surface. There is evidence that some of the word final velar nasals are underlying alvcolar nasals.

(5)	Proto-Manam	Miem	Manam	
	<i>*dan</i>	<i>dan</i>	<i>daŋ</i>	‘water’
	<i>*man</i>	<i>man</i>	<i>maŋ</i>	‘bird’

### 2.3 Inventory of vowels

Manam has five vowel phonemes.

Table 2. Manam vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

**2.3.1 Discussion.** High vocoids [i u] perturb to their respective non-syllabic vocoids [y w] in the environment of contiguous vocoids within the same syllable.

(3)	/ueno/	['we.no]	'I sleep'
	/ieno/	['ye.no]	'he sleeps'
	/goai/	[gway]	'star'

Contrast between /o/ and /u/ is neutralised when they are contiguous to vocoids within the same syllable, and are both realised as the non-syllabic vocoid [w].

(4)	/ʔualale/	[k̄ walale]	'you go (realis)'
	/goalale/	[gwalale]	'you go (irrealis)'
	/oati/	[wati]	'four'
	/t̄ou/	[tow]	'marry'
	/boaum/	[bwawm]	'your smell'

## 2.4 Notes on syllables

The Manam syllable consists of:

(C) (V<sub>1</sub>) V (V<sub>1</sub>) (N)

where V<sub>1</sub> is any vowel except *a*.

(6)	/baŋ/	'taro'	/goai/	'star'
	/ae/	'leg'	/boaum/	'your smell'

In addition there is a syllabic nasal *m̄*- as in:

(7)	/m̄-pi.le/	'I will speak'

## 42. Takia

---

---

<b>Contributors:</b>
----------------------

Introduction: <i>Malcolm D. Ross</i>
--------------------------------------

Word list: <i>Malcolm D. Ross – Mait Kilil</i>
--

---

### 1. Introduction

Takia is spoken by about 15,000 people in the Madang Province of Papua New Guinea who live on two volcanic islands, Karkar and Bagabag, located twenty kilometres off the north coast of the mainland, and in two nearby mainland coastal villages, Megiar and Serang. Most Takia speakers live on Karkar Island, which measures about twenty-five kilometres from north to south, twenty from west to east, and has a population of about 25,000, just over half of whom speak Takia. The remainder of the Karkar population speaks the Papuan (i.e. non-Austronesian) language Waskia. Takia speakers occupy the southern half of the island, Waskia speakers the northern half. Despite the striking linguistic difference between the two sections of the population, however, there are no other discernible cultural differences (McSwain 1977).

Takia speakers recognise a division of their language into two main dialect groups, coastal and inland. The coastal dialects, spoken in villages on and near the coast on Karkar Island and by all speakers on Bagabag Island and at Megiar and Serang, have a phonemic distinction between /l/ and /r/, whereas the inland dialects, spoken in inland Karkar villages, have merged these two phonemes as /l/. There are a number of other dialect differences, some of which cut across the coastal/inland boundary, but these are not considered significant by Takia speakers, and have yet to be recorded in detail. The data which form the basis of this list are from the coastal dialect and were recorded at Rigen village, two kilometres inland from the southernmost point of Karkar Island, in 1987 and 1988.

Takia is a member of the Bel language family, which forms a small part of the North New Guinea cluster of Western Oceanic languages (Ross 1988: 160-164). The best known of the Bel languages is Gedaged, originally spoken on a small island off the town of Madang, widely used as a *lingua franca* by the Lutheran Mission in the Madang Province (Osmers 1981: 77-94; Freyberg 1977) and described in a grammar by Dempwolff (n.d.) and a dictionary by Mager (1952). The latter also provides substantial lexical data

for Takia, which has otherwise been described only in unpublished manuscripts which include a dictionary by Hubers (n.d.),<sup>1</sup> a tentative phonology and a grammar sketch by Rehburg – Tuominen (1978a, 1978b),

Map 42. Takia language area

and the present author's fieldnotes and dictionary. The morphosyntax of the Bel languages has undergone significant restructuring, evidently as a result of their speakers' bilingualism in one or more Papuan languages at an earlier stage in their history, so that Gedaged and Takia are languages in which postpositions follow nouns (there are no prepositions), the verb is strictly clause-final, most of the verbal morphology follows the verb stem, and clauses form chains linked by special sentence-medial verb forms (Ross 1987; 1988: 180). This means that the Bel languages are grammatically quite unlike most Austronesian languages, and typologically more similar to some of their Papuan neighbours or to Japanese and Korean. Dami, for which a word list is included in this volume, is also a Bel language, and one in which the Papuan influence has evidently had even more profound effects than in Gedaged and Takia, since the process of vocabulary replacement appears to have proceeded further in Dami.

1. Fr. Hubers established the Catholic mission on Karkar Island in 1935 and remained there until 1939, and his dictionary presumably dates from this period.

Twentieth-century borrowings into Takia are footnoted, and are from three sources. The first is German, which was spoken by missionaries and government officials stationed on Karkar Island during the last decade (1908 to 1918) of the German administration of New Guinea. The second is Gedaged, mentioned above, and introduced as a mission *lingua franca* late in the German period. It grew in importance between the World Wars, but was supplanted on Karkar Island by the third source of borrowings, Tok Pisin, in the years immediately after the second World War. Unlike German and Gedaged, which were never widely used by Karkar Islanders, Tok Pisin (New Guinea Pidgin, the *lingua franca* of much of Papua New Guinea) is spoken by the entire Karkar population. It is used for communication between Takia and Waskia speakers and with speakers of other languages.

## 2. Notes on phonology

The phonemes of Takia are:

Table 1. Consonants

		Labial	Alveolar	Velar
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>g</i>
Fricatives		<i>f</i>	<i>s</i>	
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>
Laterals			<i>l</i>	
Trills			<i>r</i>	
Semivowels		<i>w</i>	<i>y</i>	

As noted above, the inland dialects lack /r/, which has merged with /l/.

In the published portions of the Takia Bible, the semivowel /y/ is represented as *j* in accordance with the German-based orthography of the mission *lingua franca* Gedaged. However, *y* is used here, since almost all the younger generation use it as a result of literacy in English and/or Tok Pisin.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

In the dialect of the word list and in some other dialects, /a/ rises to [æ] if the nucleus of the following syllable is /i/. For example, /bani-n/ ‘his arm’ becomes [bænin].

All sequences of vowels are polysyllabic, i.e. each vowel forms the nucleus of a syllable, except for certain word-final rising sequences. The rising vowel sequences /ei/, /ou/, and /ao/ are word-finally sometimes monosyllabic, sometimes disyllabic. There is, for example, a contrast between monosyllabic /dou/ ‘headdress’ and disyllabic /do.u/ ‘slitgong’ (where ./ denotes a syllable boundary). In the word list, disyllabic occurrences of these sequences are written with an acute accent over the second vowel, i.e. *doú* ‘slitgong’. The rising vowel sequences /oi/ and /eu/ are always monosyllabic word-finally, whilst /ai/, /ae/, and /au/ are always disyllabic word-finally.

In the dialect of the word list and in some other coastal dialects, the sequence /ae/ is phonetically [æ̃], as in /daeg/ ‘wooden plate’, phonetically [dæ̃g].

Whilst falling vowel sequences (e.g. /io/, /ua/) occur word-medially and word-finally and are always disyllabic, they never occur word-initially. Where a falling sequence of /i/ or /u/ plus a non-high vowel is present word-initially in the underlying form, the word-initial high vowel always becomes a semivowel, i.e. /i/ becomes /y/, /u/ becomes /w/. For example, /u-ao/ ‘you go’ (consisting of ‘you.sg’+ ‘go’) is always manifested as [wao] and written *wao* by literate Takia speakers.

Takia stress placement is strictly related to vowel height. Within a word, stress falls by default on the last syllable, but is attracted to an earlier syllable if that syllable’s vowel is lower than the vowel(s) of any succeeding syllables. For example, /tama-n/ ‘his father’ (consisting of ‘father’ + ‘his’) has default final-syllable stress, i.e. [ta'man], whereas in /nanu-n/ ‘his child’ stress is attracted to the lower vowel of the penultimate syllable, i.e. ['nanun]. The stress placement rule operates after the addition of affixes, but before the addition of enclitics. For example, in /i-fini-da/ ‘he is hitting (it)’ (consisting of ‘he’ + ‘hit’ + IMPERF), stress falls by default on the final syllable of the stem, i.e. [ifi'ni], and the aspectual clitic is then added, giving [ifi'nida].

Vowel neutralisation occurs in consonant-initial syllables with a vowel other than /a/ if they occur somewhere before the main word stress. There are two stages of neutralisation.

- a) In the first stage of neutralisation, /e/ merges with /i/, /o/ with /u/. This is especially clear in reduplicated forms like [ŋi'saŋes] ‘hawk’ and [mul'mol] ‘a kind of tree’, which are derived, historically at least, from

/ŋesaŋes/ and /molmol/. This means that in syllables which precede the main word stress, only the vowels /i/, /u/ and /a/ occur.

- b) The second stage of neutralisation takes its input from the first and affects /i/ and /u/ in syllables which precede the main word stress. Where the vowel of the stressed syllable is /i/, /e/, /o/ or /u/ (i.e. anything other than /a/), the vowels of preceding syllables may change in accordance with vowel harmony rules, as follows:
- i) in some dialects, /i/ merges with /u/ as [u] if the vowel of the stressed syllable is /o/ or /u/;
  - ii) in other dialects, /i/ and /u/ merge as [i] if the vowel of the stressed syllable is /e/ or /i/ and as [u] if the vowel of the stressed syllable is /o/ or /u/.

The effect of this harmonisation is evident in cases where a change or addition of affix results in a change of vowel in the stressed syllable:

	/i-funi-da/	/i-fun-o-da/
	he-hit-IMPERF	he-hit-you.SING-IMPERF
	'he is hitting (it)'	'he is hitting you'
i)	[ifu'nida]	[ifu'noda]
ii)	[ifi'nida]	[ifu'noda]

Neutralisation may be followed by vowel reduction. Its effect is optionally to reduce /i/ or /u/ in the syllable immediately preceding the stressed syllable to schwa (i.e. [ə]) or to zero, so that the forms above may become [ifə'nida] or [if'nida], and [ifə'noda] or [if'noda].

Some items in the word list show a consonant sequence which probably reflects the reduction of a vowel to zero. Thus *slali* 'perspiration' (04.550) probably reflects either /silali/ or /sulali/. However, a form with the vowel present has not been recorded.

There is also a vowel reduction rule affecting /a/ which

- a) optionally reduces /a/ to [ə] in enclitics, so that, for example, the forms above may become respectively [if'nidə] and [if'nodə];
- b) optionally reduces /a/ to [ə] or zero in the penultimate syllable of words whose last three syllables all have /a/ as their nucleus; e.g. /wananan/ 'hot' is phonetically [wana'nan] or [wanə'nan] or [wan'nan].

Prothesis may occur in items which begin with underlying /r-/. These frequently acquire a prothetic /u-/ in some coastal dialects. This is then subject to the rules similar to those discussed above, so that we find, for example, the following variants:

	/raru/ 'two'	/ru/ 'language'	/rib/ 'kind of beetle'	/rigen/ 'rafters'
	[raru]	[ru]	[rib]	[rigen]
prothesis:	[uraru]	[uru]	[u'rib]	[uri'gen]
neutralisation:	-	-	[i'rib]	[iri'gen]
reduction:	-	-	-	[ir'gen]

These rules differ from those discussed above in that neutralisation (harmony) here applies to the prothetic initial vowel, whereas it otherwise applies only to consonant-initial syllables. As a result, items with underlying initial /ur-/, e.g. /urat/ 'work', /urit/ 'octopus', are clearly distinguishable from those with prothetic /u-/ because they always have initial [u-]: [urat], [urit].

### 3. Notes on morphosyntax

These notes are intended to elucidate the items in the word list and the examples given in the footnotes to the word list, and the reader is referred to the footnotes for more extensive illustration. Items in the word list are segmented with hyphens into their component morphemes, and glosses of these are provided in the footnotes. Verbs are shown with an initial hyphen, indicating that they are almost always preceded by a subject prefix (see below).

Takia morphemes may be classified as stems, affixes and enclitics. Affixes combine with stems to form phonological and grammatical words, but enclitics do not participate fully in phonological rules (see section 2) and usually have a preceding phrase or clause or sentence in their grammatical scope.

Nouns in Takia, as in most Oceanic languages, may be inalienably or alienably possessed. Inalienably possessed nouns have a possessive suffix which marks the person and number of the possessor, whereas alienably possessed nouns are unsuffixed. The possessor, if explicitly mentioned, precedes the possessed noun. For example:

<i>ut</i>	<i>patu-n</i>	<i>ŋai</i>	<i>gurma-g</i>	<i>rou-n</i>
louse	egg-his	I	head-my	hair-its
'louse's egg, nit'		'the hair of my head'		

Here *-n* and *-g* are possessive suffixes attached to inalienably possessed nouns, whilst *ut* is the possessor of *patun*, *ŋai* is the possessor of *gurnag*, and

*ŋai gurnag* the possessor of *roun*. In the word list, inalienably possessed nouns are shown with the third person singular possessive suffix *-n*.

Of quite frequent occurrence in the word list is the possessive suffix *-k*. This is the first person singular suffix used in vocatives, but it has also come to denote an unpossessed variant of the noun. Thus the phrase *ŋai nanu-g* 'my child' displays the first person singular possessive suffix *-g*, coreferential with the possessor *ŋai* 'I', whereas *nanu-k* may function either as the vocative 'my child!' or as the unpossessed noun 'a child'.

There are a number of instances in the word list where a noun has both inalienably and alienably possessed variants. In some cases, the inalienably possessed form is basic and the alienably possessed variant is a truncation, e.g. *dara-n* 'blood' (inalienably possessed), *dar* (alienably possessed truncation). In other cases, the alienably possessed form is basic and the inalienably possessed variant is formed by adding the enclitic *-a-* with a possessive suffix attached, e.g. *alao* 'claw' (alienably possessed), *alao-a-n* (inalienably possessed with enclitic). The occurrence of the enclitic *-a-* is shown by the presence of hyphens before and after it. The distinction between the two kinds of case is phonologically significant because it affects the operation of stress placement (and consequently of other rules). Stress is by default word-final, so that *dara-n* gives [da'ran], but enclitics are not fully integrated into a phonological word, and are never stressed, so that *alao-a-n* gives [a'laoan], not \*[alao'an] (see section 2).

Many adjectives in Takia take the same suffixes as possessed nouns,<sup>1</sup> agreeing in person and number with the noun they describe, but not fulfilling a possessive function:

<i>ab</i>	<i>tubu-n</i>	<i>ab</i>	<i>tubu-di</i>
house	big-his	house	big-their
'a big house'		'big houses'	

Functions which in other Oceanic languages are performed by prepositions are carried in Takia by postpositional enclitics. The most common of these are the two locative enclitics *-lo* and *-na*, as in *ab-lo* 'at/in the house', *tan-na* 'on the ground'.

Verbs are almost always preceded by a subject prefix marking the person and number of the subject (which need not itself be explicitly mentioned). The forms of the prefixes are morphophonemically determined:

1. This fact raises the question of whether these items are in fact adjectives or nouns, but this lies beyond the scope of this introduction.

## 43. Dami

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>George Elliott</i>
--

---

---

### 1. Introduction

---

---

Dami is a language spoken in the Trans Gogol area of the Madang Province of Papua New Guinea. Its boundaries extend from the point where the Naru River flows into the Gogol River for about ten kilometres NW along the Gogol River, and about 20 kilometres SW along the Naru River. The boundary can then be completed by joining the points on the two rivers by a roughly straight line. Within the triangle so formed, there are a few small villages from other language groups, a large area of uninhabited and uncultivated land, as well as all of the Dami villages, except Ato which is on the Southern bank of the Naru about five or six kilometres from the point where the Naru joins the Gogol. The Dami population is about 1500.

There are two major dialects in terms of population. These are the Gonoa-Kuyombon or Southern dialect, and the Barum-Mair-Atu or Western dialect. These have roughly 600 speakers each. The Northern dialect spoken in Derin, Tadub and Bur has only 200 speakers and appears to be a blend of the other two dialects. The people of Buroa have what may be regarded as a variety of the Southern dialect, although some vocabulary items in common use are the same as in the Western dialect. The people of Ato have intermarried and have extensive contact with the people of the Yaap speaking village of Didiwala. As a result they have taken over many Yaap terms and dispensed with a number of grammatical features. One of these is inalienable possession. Originally however, Ato appears to have belonged to the Southern dialect.

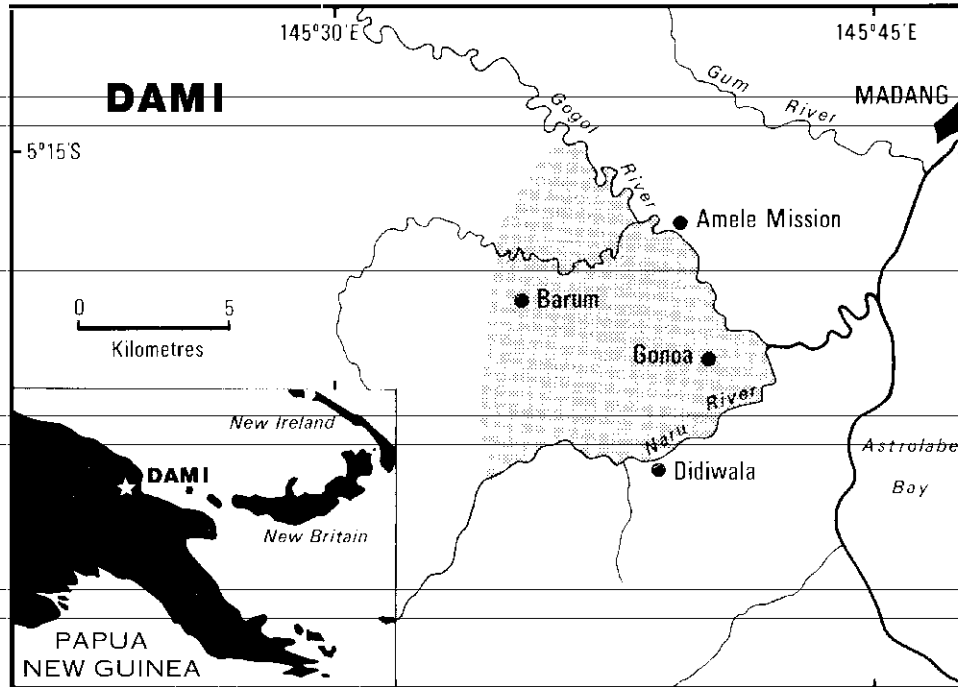

The main feature which distinguishes these dialects is vocabulary. The wordlist presented here was collected in the Southern dialect. In some cases a word may be used only by one dialect, in other cases a particular word may be used more commonly in one dialect, although the alternative term(s) may be known and occasionally used. This situation is influenced no doubt by the intermarriage between clans from different dialect areas.

There is very little variation in the pronunciation of words or phonemes between the dialects. In the Southern and Northern dialects /r/ tends to be

---

---

trilled. In the Western dialect it is normally a flap. In the Southern dialect, a high vowel in a final open syllable, following a syllable containing a double /aa/ or /ee/, is considerably weakened to being whispered or merely mouthed. In both Ato and Buroa, these vowels are fully retained, but in the Northern and Western dialects, they have completely disappeared. In fact in the Western dialect, the vowel in the preceding syllable is not doubled.

Map 43. Dami language area

There are no published works devoted exclusively to the Dami language. The language is however referred to by Z'graggen, in a number of his works on comparative linguistics (1975, 1976). He calls the language "Ham". This is the name used by Amele language speakers for part of the land inhabited by the Dami people. Z'graggen's main information on Dami came from a Dami speaker who had spent most of his life in the Amele area.

The information in the word list has been collected by the writer over a period between May 1975 and November 1987, while resident among the Dami people, and working with the Papua New Guinea Branch of the Summer Institute of Linguistics. Special thanks go to Kuti Muduri and Goyoru Sol who have given valuable assistance in the overall project and particularly in the compiling of this wordlist.

## 2. Phonology

Below is a brief overview of the phonology of Dami (Southern dialect). More detailed information can be found in unpublished papers (Elliot n.d.) held in the files of the Summer Institute of Linguistics, Ukarumpa, Papua New Guinea.

### 2.1 Word stress

Stress falls on alternate syllables, the primary stress normally falling on the final syllable of a word. Primary stress may be attracted away from a final open non-nasalised single vowel syllable, if the vowel in a preceding syllable is lower in terms of tongue height than that of the final syllable, or if the nucleus of a preceding syllable contains a vowel sequence.

### 2.2 Inventory of consonants

Dami has 13 consonant phonemes.

*Table 1. Consonants*

		Bilabial	Alveolar	Velar
Stops	vl		<i>t</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>g</i>
Fricatives		<i>ɸ</i>	<i>s</i>	
Nasals		<i>m</i>	<i>n</i>	
Laterals			<i>l</i>	
Trills			<i>r</i>	
Semivowels		<i>w</i>		<i>y</i>

**2.2.1 Discussion.** The phoneme /ɸ/ is sometimes articulated as a stop, [p], in word final position, but initially and intervocalically it is invariably [ɸ].

All consonants, except the semivowels, which do not occur word finally, occur initially, intervocalically and finally. Consonant sequences are rare as closed syllables normally occur only word finally. Most of the handful of exceptions to this occur in words which can be demonstrated to be contractions of what historically were two or more words. The consonant sequence occurs at what was originally the word boundary.

### 2.3 Inventory of vowels

Dami has five pairs of vowel phonemes. For each tongue position, there is an oral and a nasalised vowel.

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ũ</i>
Low	<i>e ē</i>	<i>a â</i>	<i>o õ</i>

**2.2.1 Discussion.** The front and central vowels tend to be lax or open, with no discernible variation except in the case of /e/, which is tenser in sequence preceding /i/. The back vowels also tend to be lax, but are noticeably tenser in final open stressed syllables, and in sequences.

The following vowel sequences occur within a syllable nucleus.

*/ii/, /ei/, /ai/, /oi/, /ee/, /aa/, /oo/, /eu/, /au/, /ou/, /uu/, /aai/ and /aau/.*

All of these sequences have nasalised counterparts.

## 44. Mbula

---

---

<b>Contributors:</b>
----------------------

Introduction and Wordlist : <i>Salme E. – Robert D. Bugenhagen</i>
--

---

---

### 1. Introduction

---

---

Mbula<sup>1</sup> is a language spoken on Sakar Island and the eastern half of Umboi Island in the Morobe Province of Papua New Guinea. There are some 2500 speakers of the language, who live in seven villages: Alario, Kabi, Kampalap, Marile, Birik, Yangla, and Gauru. There are four mutually intelligible dialects: (1) the Sakar dialect, which is spoken only in Alario village on Sakar Island, (2) the Northern dialect, which is spoken in the villages of Kabi and Kampalap, (3) the Central dialect, which is spoken in Marile, Birik, and Yangla, and (4) the Gauru dialect, which is spoken only in Gauru village.

There is very little earlier published work on the language or culture. Chinnery's anthropological report (1926: 24-29) contains some notes on vocabulary by the Reverend G. Bamler, and Harding (1967), in his study of the Siassi traders, makes some references to the Kaimanga. Bugenhagen (1986) describes the possessive system of the language, Bugenhagen (1989) the encodings of various degrees of transitivity, and Bugenhagen (1990) the modality system of the language.

Hooley (1971) classified Mbula as a member of the Siassi Family. Ross (1988: chapter 5) classifies it as a member of the Vitiaz linkage of his North New Guinea Cluster.

Data have been collected on the language by the authors since October 1982. Approximately two and half years of this period have been spent in residence in Yangla village. The fieldwork has been conducted under the auspices of the Summer Institute of Linguistics and the government of Papua New Guinea. We are grateful to the Papua New Guinea Government for allowing us the privilege of serving in their country, and to the many Mbula speakers who have been willing to share their homes, food, time, language,

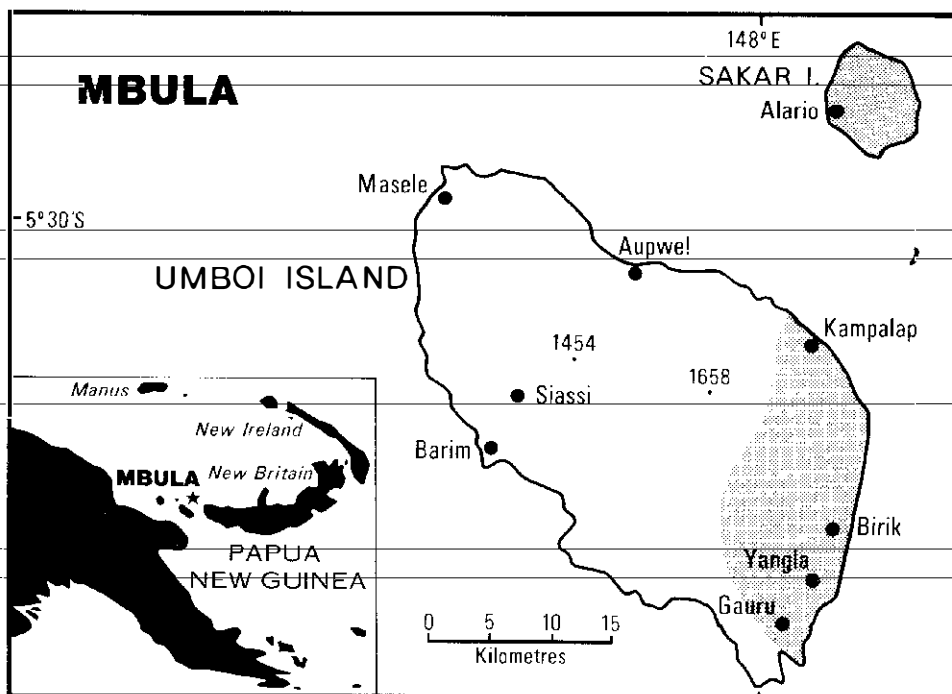

---

1. Mbula has generally been referred to in the literature as Mangap or Kaimanga. During our residence in the area, we have heard the names Mangāba and Mbula, with different villages preferring one or the other name.

---

---

culture, and in general their lives with us. Our main teachers of the language have been: Silas Ariko of Gauru village; Giemsa Apei, Moses Gial, David Aibike, Phillip Ibop, and Makele Gilingde of Yangla village; and Dick Awa of Birik village.

Map 44. Mbula language area

## 2. Phonology

A brief overview of the phonology of the language is given below. A much more detailed treatment is to be found in the second author's dissertation (R. Bugenhagen 1991).

### 2.1 Word stress

In monomorphemic items and inalienably possessed nouns, stress falls on the initial syllable unless the form contains a long vowel, in which case stress is attracted to the syllable containing the long vowel. In verbs consisting of just a subject prefix plus a monosyllabic verb stem, stress falls on the subject prefix. In verbs containing multisyllabic but monomorphemic verb stems, stress falls on the first syllable of the verb stem, unless it is attracted by a long vowel in the stem. Finally, in multi-morphemic verb stems, stress falls

on the first syllable of the penultimate morpheme in the stem unless it is attracted by a following long vowel.

## 2.2 Inventory of consonants

Mbula has eighteen consonants:

*Table 1. Consonants*

		Labial	Dental-Alveolar	Velar
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>g</i>
Prenasalised		<i><sup>m</sup>b</i>	<i><sup>n</sup>d</i>	<i><sup>ŋ</sup>g</i>
Fricatives	vl		<i>s</i>	
	vd		<i>z</i>	
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>
Laterals			<i>l</i>	
Trills			<i>r</i>	
Semivowels		<i>w</i>	<i>y</i>	

### 2.2.1 Discussion

The only significant allophonic variations are: (1) /b/ → [β] intervocalically, (2) /t/ is palatalised when followed by a vowel cluster beginning with /i/, and (3) the voiceless stops optionally have a voiceless nasal release when they occur pre-pausally.

With regard to distribution, the following observations can be made:

- (1) Only the voiceless stops, nasals, /l/, and /r/ occur word finally.
- (2) Morpheme medially, there is a neutralisation of contrast between the voiced and voiceless oral obstruents following long vowels. Also, the phonemes /w/ and /y/ do not occur in this environment.
- (3) Morpheme initially, there is almost a neutralisation of contrast between voiced oral and voiced prenasalised stops, with the voiced oral stops tending to occur only when followed by oral, non-resonants. A few minimal pairs do, however, occur, cf. /peze/ ‘paddle’, /beze/ ‘garden house’, and /<sup>m</sup>beze/ ‘to serve’.

### 2.3 Inventory of vowels

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

There are five vowels in Mbula: /i, e, a, o, u/. Each of these has the phonetic value normally associated with the given symbol. The two high vowels are slightly lowered when they occur in clusters with non-high vocoids.

There is a contrast in vocoid length, evidenced by pairs like: /-mēte/ ‘to die’ and /mete/ ‘disease’; /-moto/ ‘be afraid’ and /mōto/ ‘snake’.<sup>1</sup> The contrast is very restricted in distribution, however, occurring only in the following environment:

/\_\_ consonant + vocoid of the same quality + morpheme boundary

In the word list, vocoid length is indicated by a macron over the vowel.

### 2.4 An alternative phonological analysis

The segmented inventories given in sections 2.2 and 2.3 are based upon a relatively concrete analysis. A different analysis is possible if one takes morpheme boundaries into account and permits more abstract phonological representations. Under this second analysis, the length contrast of vocoids is reanalysed as a contrast between vowels which are epenthetically inserted to break up underlying consonant clusters versus vowels which are underlyingly present. A further rule lengthens vowels which are followed by a consonant, an identical vowel, and then a morpheme boundary. Obstruents also receive a different treatment, with both intervocalic voiced and voiceless oral obstruents being underlyingly voiceless. The phonetically voiced oral obstruents are then due to a rule which voices voiceless segments that are

1. Speakers of the Gauru dialect drop the vowel following the lengthened vocoid, if it does not result in a prenasalised stop ending up in morpheme final position. For example, they pronounce /mōto/ ‘snake’ as /mōt/, but do not drop the final vowel of /lō<sup>n</sup>do/ ‘run’.

underlyingly intervocalic.<sup>1</sup> The differences between the concrete and abstract analyses are perhaps best seen from a comparative listing of some representative forms:

Concrete analysis	Abstract analysis	Meaning
/bāda/	/-bata/	‘to carry’
/pēze/	/pese/	‘paddle’
/pesem/	/psem/	‘your (sg) navel’
/-moto/	/-mto/	‘be afraid’
/mata-/	/mta-/	‘eye’
/mōto/	/moto/	‘snake’
/kopom/	/kpom/	‘your (sg) stomach’
/abe/	/ape/	‘ripe’
/ku <sup>m</sup> bum/	/k <sup>m</sup> bum/	‘your (sg) leg’
/katāma/	/ktama/	‘door’
/bībi/	/bipi/	‘big’
/bōzo/	/boso/	‘many, much’
/paka-/	/pka-/	‘half, part’
/-rēge/	/-reke/	‘destroy’

In order to insure phonetic transparency, the word list here follows the more concrete analysis. The purpose in outlining the abstract analysis is mainly as a caution to the effect that other analyses of the data are possible, given different methodological assumptions.

## 2.5 Morphophonemic alternations

A number of morphophonemic alternations occur in the language. The principal ones are:

(1) Verb stem initial /p, s/ become /w, z/ in reduplicated forms.

/pēze/	→	/wes-wēze/	‘be paddling’
/-su/	→	/-zu-zu/	‘be descending’

(2) Final voiceless obstruents become voiced if they become intervocalic.

/-pet/	→	/wed-et/	‘be appearing’
/-kes/		/-kez-es/	‘be crawling along’

1. While /p, k, s/ would always voice intervocalically, the situation with /t/ is more complicated. It would voice following a voiced oral obstruent in the same morpheme, but otherwise remain voiceless.

- (3) Morpheme medial prenasalised stops become nasals if they end up syllable final.

/lō <sup>n</sup> do/	→	/lon-lō <sup>n</sup> do/	‘be running’
/-sē <sup>n</sup> ge/		/-zeŋ-zē <sup>n</sup> ge/	‘be laughing’

- (4) Morpheme medial voiced oral obstruents become voiceless if they end up syllable final before any consonant except another voiced oral obstruent.

/-pāza/	→	/-was-wāza/	‘be planting’
/-rēge/	→	/-rek-rēge/	‘be destroying’

- (5) Verb stems beginning with a prenasalised stop lose the prenasalisation following a Subject prefix that ends in a nasal.

/am- <sup>n</sup> du/	→	/amdu/	‘we (excl) cross’
/aŋ- <sup>n</sup> dēbe/	→	/aŋdēbe/	‘I cut down’

- (6) Geminate consonant clusters are reduced.

/am-mar/	→	/amar/	‘we (excl) come’
----------	---	--------	------------------

- (7) In the inalienably possessed nouns, there is a stem alternation whereby /a/ becomes /o/ in 1sg, 2sg, 1pl excl, and 2pl forms. This is no doubt a relic of ablaut caused by the Proto Oceanic possessive endings that ended in /u/. A handful of items have an irregular first singular form in /a/ rather than /o/. In the wordlist, these irregular forms are represented with a capital A. Compare:

	<i>nama-</i> ‘hand’	<i>tAmA-</i> ‘father’
1sg	<i>nomoŋ</i>	<i>tamaŋ</i>
2sg	<i>nomom</i>	<i>tomom</i>
3sg	<i>namāna</i>	<i>tamāna</i>
1pl incl	<i>namanda</i>	<i>tamanda</i>
1pl excl	<i>nomoyam</i>	<i>tomoyam</i>
2pl	<i>nomoyom</i>	<i>tomoyom</i>
3pl	<i>naman</i>	<i>taman</i>

- (8) The first person plural inclusive subject prefix *tV-*, the second person plural subject prefix *kV-*, one allomorph of the causative prefix *pV-*, and the detransitivising prefix *mV-* exhibit an epenthetically inserted vowel which harmonises with the first following vowel. Similarly, the third person singular and the first person plural inclusive possessor suffixes *-VnV* and *-<sup>n</sup>dV* contain underspecified vowels which harmonise with the first preceding vowel.

### 3. Morphology

The principal morphological processes of the language are: (1) Subject agreement prefixation on the verbs, (2) possessor agreement suffixation on the inalienably possessed nouns, (3) causation formation with the prefix *pV-* ~ *pa-*, (4) derivation of intransitive verbs from transitives with the prefix *mV-*, (5) derivation of reciprocal verb forms with the prefix *par-*, (6) nominalisations and adjectival derivations with the suffix *-ŋa-*, which is in turn inflected with the possessor suffixes, and (7) reduplication to encode imperfective aspect, diminution, and plurality. The subject agreement prefixes and possessor suffixes are listed below:

	Subject agreement prefixes	Possessor suffixes
1sg	<i>aŋ-</i>	<i>-ŋ</i>
2sg	$\emptyset^1$	<i>-m</i>
3sg	<i>i-</i>	<i>-VnV<sup>2</sup></i>
i pi inci	<i>tĩ-</i>	<i>-d̃v</i>
1pl excl	<i>am-</i>	<i>-yam</i>
2pl	<i>kV-</i>	<i>-yom</i>
3pl	<i>ti-</i>	<i>-n</i>

A representative paradigm for each set is now given:

	<i>-la</i> ‘to go’	<i>ku<sup>m</sup>bu-</i> ‘leg’
1sg	<i>aŋla</i>	<i>ku<sup>m</sup>buŋ</i>
2sg	<i>la</i>	<i>ku<sup>m</sup>bum</i>
3sg	<i>ila</i>	<i>ku<sup>m</sup>būnu</i>
1pl incl	<i>tala</i>	<i>ku<sup>m</sup>bu<sup>n</sup>du</i>
1pl excl	<i>amla</i>	<i>ku<sup>m</sup>buyam</i>
2pl	<i>kala</i>	<i>ku<sup>m</sup>buyom</i>
3pl	<i>tila</i>	<i>ku<sup>m</sup>bun</i>

In the word list, forms which are obligatorily inflected for subject agreement are indicated with a preceding hyphen- e.g. *-kem* ‘steal’, *-ko* ‘flee’ – while

1. All of the dialects exhibit a null second person singular subject prefix except for the Gauru dialect, which has *ku-* unless the verb stem begins with a /k/.
2. For Gauru speakers, the third singular possessor suffix is *-Vn*.

forms that must be inflected with the possessor suffixes are indicated with a following hyphen- e.g. *mata-* ‘eye’, *kunu-* ‘soul’.

#### 4. Syntax

It can be briefly noted that in Mbula:

- (1) All noun phrase modifiers follow the head noun except for the possessors of inalienably possessed nouns and some nominal complements.
- (2) Only prepositions occur.
- (3) The basic sentence structure is:  
Subject-Verb-Object-Prepositional Phrases-Complement Clauses.
- (4) Word order is quite rigid, except for the fronting of contrastive elements and entities that are being established or re-established as discourse topics.

## 45. Yabem

---

---

<b>Contributors:</b>
Introduction: <i>Malcolm D. Ross</i>
Word list: <i>Johannes F. Streicher – Malcolm D. Ross</i>

---

### 1. Introduction

---

When the first German Lutheran missionaries to New Guinea, sent by the Neuendettelsau Mission, started work at Simbang in 1886, they found themselves in the centre of the Yabem language area. Yabem was then spoken by just nine hundred people living in coastal villages on the Huon Peninsula of Papua New Guinea from Kamlaw, just north of the present-day township of Finschhafen, to Kasanga, about thirty kilometres to the south (Renck 1977). However, because Yabem was the language of the first converts, it was also the language of the first local evangelists and the language that the missionaries first reduced to writing. As a result, it was carried wherever the Neuendettelsau Mission worked among Austronesian speakers in what is now the Morobe Province of Papua New Guinea, so that by the time the missionary Heinrich Zahn wrote the foreword to his Yabem textbook in 1939, the language had acquired about 15,000 speakers and was understood as a mission *lingua franca* by as many as one hundred thousand (Zahn 1940: v).

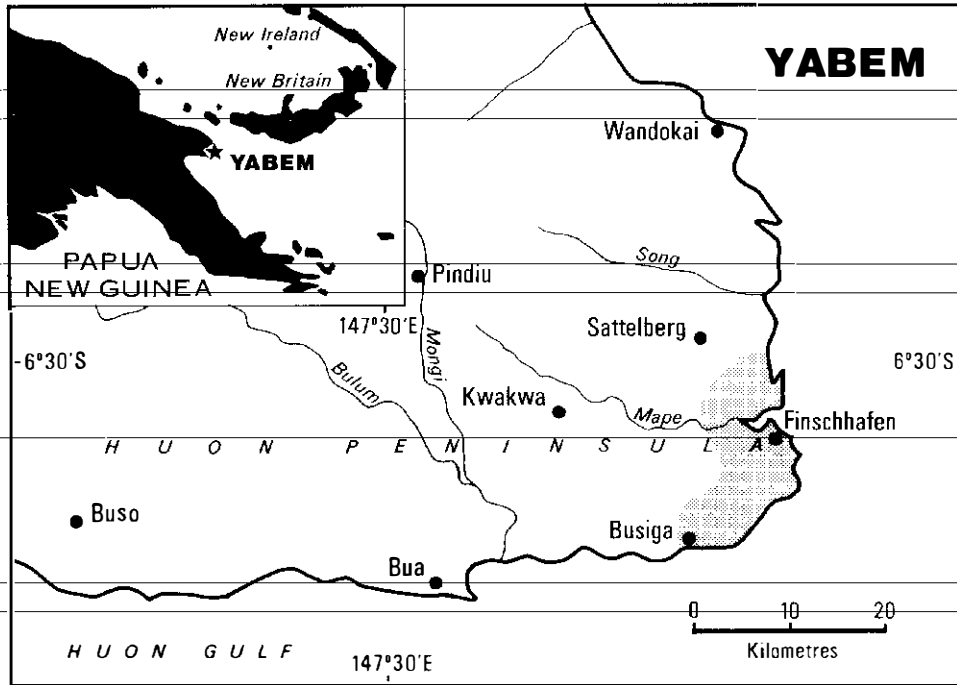

The mission laid considerable stress on vernacular literacy and established an extensive vernacular education system whose schools used either Yabem or Kâte.<sup>1</sup> During the ten years after the Second World War, some 30,000 students received Yabem-medium instruction (Streicher 1982: v). The number of speakers of Yabem thus continued to grow until the late 1950s, when in the wake of the Australian Administration's policy banning vernacular schooling in favour of English, many of the schools assumed a much reduced role or were closed (Osmers 1981). Renck (1977) estimated that there were still about 25,000 Yabem speakers, a figure which implies that at its height in the late 1940s and early 1950s the number of speakers was even higher. Today this number is receding rapidly, as the younger

---

1. Kâte is a non-Austronesian language spoken inland from Finschhafen and used as the mission *lingua franca* with speakers of non-Austronesian languages.

---

generation is acquiring Tok Pisin (New Guinea Pidgin, the *lingua franca* of much of Papua New Guinea), rather than Yabem, as the language of inter-tribal communication.

Map 45. Yabem language area

As a result of this recent history, Yabem is among the best documented Austronesian languages of Melanesia. Otto Dempwolff, the founder of modern Austronesian linguistics, published texts taken from letters written in 1901 and 1902 by and to plantation workers living away from their home villages (Dempwolff 1905). Pilhofer (1963: 67) reports that until 1914 there was considerable puzzlement among missionaries that a single Yabem word could apparently have so many meanings. It was Dempwolff, at that time still a medical officer with the German Army in New Guinea, who pointed out to Zahn that what seemed to be one word was in fact often several, distinguished by vowel contrasts which escaped the European ear and by a contrast between high and low tone (Zahn, foreword to Dempwolff 1939).<sup>1</sup> After the First World War, Dempwolff was appointed Professor at the University of Hamburg, and continuing collaboration with Zahn resulted in Dempwolff's Yabem grammar (1939) and Zahn's Yabem teaching text

1. Interestingly, the texts in Dempwolff (1905) lack the contrast between high and mid-high vowels, show no awareness of tone, and also omit the glottal stop.

(1940).<sup>1</sup> Zahn meanwhile had produced a mimeoed Yabem–German dictionary as early as 1917, which his colleague Johannes Streicher revised many years later (after the latter’s retirement) and expanded as Streicher (1982). A large quantity of material, including the New Testament, has been published in Yabem, and a list of the more important items is given by Streicher (1982: 657–658). The availability of printed material has led other linguists to work on the analysis of Yabem, resulting in Bradshaw (1980), Bisang (1986) and Grüniger (1986).

There is no significant dialect variation in modern Yabem (i.e. within the villages to which it is native), but this may well be a result of standardisation which has occurred because Yabem has become a *lingua franca* and a written language. At the same time, there is no evidence that radical changes have occurred in the language since 1886. Although the language of the word list is standardised Yabem, it is (apart from the obvious modern borrowings) probably also a fair reflection of the language of a century ago.

Yabem is one of the three member languages of the North Huon Gulf chain, itself part of the Huon Gulf family (Ross 1988: 132–133) which also includes the languages of the Markham Valley (see Adzera, in this volume) and of the region to the south of the valley (see Buang, in this volume). The three languages of the North Huon Gulf chain, Yabem, Bukawa and Kela, share a set of changes which have resulted in phonological attrition, loss of some former consonant contrasts, a tendency toward monosyllabism, and the development of tone<sup>2</sup> (Ross 1988: 148–152). They are thus phonologically quite unlike most Oceanic Austronesian languages, including their neighbours in the Morobe Province, and Yabem was really quite unsuitable for use as a *lingua franca*, as Dempwolff (n.d.)<sup>3</sup> pointed out. However, precisely because the first groups to be evangelised by Yabem speakers were the Kela and the Bukawa, for whom Yabem was easy to learn, a beachhead

1. Dempwolff’s grammar is a remarkably insightful description of an “exotic” language, prefiguring the “notional” and “functional” approaches to language description of the 1970s and 1980s, a fact to which Bradshaw (1980) pays tribute.
2. It is not clear whether tone occurs in present-day Kela, but it is reconstructible in its immediate ancestor.
3. Dempwolff (n.d.) is an analysis of the Adzera language of the Markham Valley which concludes with a comparison of the features of German, Yabem, Kâtc, and Adzera and the degree to which they lend themselves to use as a *lingua franca*. The manuscript was apparently written around 1928 (Susanne Holzknecht, pers. comm.) at a time when there was controversy in the mission as to whether Adzera should assume a role as a *lingua franca* (Osmers 1981: 88). Dempwolff came down strongly on the side of Adzera, but was ignored by the missionaries, and Yabem was finally introduced among Adzera-speakers in 1937 (Pilhofer 1963: 170).

was established for Yabem as a *lingua franca* before a group speaking a more distantly related Austronesian language attempted – with difficulty – to learn it (Pilhofer 1961: 139-140, 151).

The fact that Yabem and Bukawa are tone languages has evoked considerable interest in the literature, not only in the works referred to above but also in Capell (1949). The genesis of tone in the North Huon Gulf languages has been reconstructed by Bradshaw (1979) and Ross (1988: 149, 418-419), and a brief description of tone in present-day Yabem is given below.

More recent borrowings into Yabem are footnoted in the word list, and are from two major sources. The first is German, which was spoken by missionaries and government officials during the German administration of New Guinea. The other is English, which supplanted German as the language of administration after 1918. There are many items footnoted as English borrowings which were probably borrowed via Tok Pisin, but their phonological restructuring in Yabem makes it impossible to be sure of the source. One word, *bulimakao* ‘cattle’, is footnoted as a Tok Pisin borrowing, as it is not a modern English word: however, even here the source is uncertain, as ‘bull-ma-cow’ was current in nineteenth-century English jargon in the Pacific. Yabem *mēdesiŋ* ‘medicine’, on the other hand, is almost certainly not a borrowing from Tok Pisin, which has the form *marasin*. There are also a number of cases, for example Yabem *gɔɔɔɔ* ‘gold’, where we cannot be certain whether the source was German *Gold* or English *gold*.

A third source of borrowings is Malay, which had some currency from about 1885 to 1895 on the plantations established by the German New Guinea Company because labour was imported from Indonesia. The first of these plantations was established in 1885 at Finschhafen, that is, within the area where Yabem was spoken natively.

## 2. Notes on phonology and morphophonemics

The phonology of Yabem is unusual among Oceanic Austronesian languages not only for the presence of tone, but also for an inventory of phonemes which seems quite large and complex in comparison with many other Oceanic Austronesian languages.

On a traditional analysis, the consonant phonemes of Yabem are:

Table 1. Consonants

		Labial	Labialised labial	Alveolar	Velar	Labialised velar	Glottal
Stops	vl	<i>p</i>	<i>p<sup>w</sup></i>	<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>	ʔ
	vd	<i>b</i>	<i>b<sup>w</sup></i>	<i>d</i>	<i>g</i>	<i>g<sup>w</sup></i>	
Prenas. stops		<i>mb</i>	<i>mb<sup>w</sup></i>	<i><sup>n</sup>d</i>	<i><sup>ŋ</sup>g</i>	<i><sup>ŋ</sup>g<sup>w</sup></i>	
Fricatives				<i>s</i>			( <i>h</i> )
Prenas. fricatives				<i><sup>n</sup>s</i>			
Nasals		<i>m</i>	<i>m<sup>w</sup></i>	<i>n</i>	<i>ŋ</i>		
Laterals				<i>l</i>			
Semivowels			<i>w</i>	<i>y</i>			

The phoneme /h/ is shown in parentheses as it occurs only in loanwords from European languages.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Mid-low	<i>ɛ</i>		<i>ɔ</i>
Low		<i>a</i>	

Phonetically, /e/, /ɛ/, /ɔ/ and /o/ are each somewhat higher than the phonetic use of these symbols normally indicates. As a result, the distinction between the front vowels /i/ and /e/ is quite difficult for a non-native listener to perceive. The corresponding distinction between the back vowels /o/ and /u/ is less problematic, because /u/ is somewhat centralised, and is phonetically somewhere between [u] and [ʊ].

This phoneme inventory becomes simpler if we recognise that there are quite severe constraints on the phonemes which may occur together in a single syllable or within a simple word. Some of the features which are used to distinguish phonemes in the inventory above are more economically treated as features which belong to the syllable or the simple word, not to the

consonant or the vowel.<sup>1</sup> The “simple word” is, for present purposes, a simple stem with its prefix or suffix (if any), but not a combination of stems (a compound word) or a stem with a clitic attached.

Simple words in Yabem usually have one or two syllables. A single-syllable word may be one of three kinds: a plain stem, like *ŋaʔ* ‘man’, or an inalienably possessed noun with its possessive suffix, like *sa-m* ‘your mother’s brother’ (*sa-* ‘mother’s brother’; *-m* ‘your (singular)’), or verb with its subject pronominal prefix, like *g-e* ‘he pulled’ (*g(e)-* ‘third person singular subject, realis mood’; *-e* ‘pull’). A two-syllable word may be of the same three kinds, for example, *malaʔ* ‘village’ (plain stem), *tama-m* ‘your father’, or *ge-meŋ* ‘he came’. The only three-syllable forms which are clearly simple words are verb forms consisting of a subject pronominal prefix and a two-syllable stem, like *ke-dam<sup>w</sup>e* ‘he licked’.

Word-initially and -medially Yabem syllables have the form (C)V, where C is a consonant, V a vowel, and parentheses indicate that the consonant need not occur. Word-finally, their form is (C)V(C). Because a number of phonological processes in Yabem are most readily described by working backwards from the end of a word, the convention is adopted here of numbering consonants and vowels from right to left. Thus a two-syllable word with the maximum complement of consonants has the form  $C_2V_2C_1V_1C_0$ .

There is one exception to the assertion that word-final syllables have the form (C)V(C): there are three one-syllable simple words which all have the same form, namely the syllabic nasal *ɪ̃m* ‘(1) banana; (2) base, stump; (3) turtle’ (the grave accent indicates low tone).<sup>2</sup>

Any consonant except the glottal stop <sup>ʔ</sup> may occur in syllable-initial position ( $C_{1...n}$ ), but the prenasalised consonants never occur as the initial consonant of a word. In a simple word,  $C_0$  is limited to *p*, *b*, *m*, *ŋ*, and <sup>ʔ</sup>. Since <sup>ʔ</sup> only occurs as  $C_0$ , this suggests that it is not really a consonant phoneme but simply a feature of the final syllable. In Bukawa, Yabem’s closest relative, there is a rule whereby, if  $C_1$  is a nasal, it is replaced by the

1. The phonology of Yabem is best described using some form of non-linear phonological framework. However, the account here is a somewhat informal one, in the hope that it will remain more readable.

2. The form *ɪ̃m* ‘turtle’ apparently occurs only as part of the compound *o-ɪ̃m* ‘large turtle’ (incorrectly recorded in Streicher 1982 as *òm*). The apparent anomaly of the syllabic nasal is readily accounted for historically: the Proto Oceanic forms *\*pudi* ‘banana’, *\*puqun* ‘base, stump’ and *\*poŋu* ‘turtle’ all became Proto North Huon Gulf *\*vuŋ*, and Yabem *ɪ̃m* represents a coalescence of the bilabiality of *\*v*, the vocalism of *\*u* and the nasality of *\*ŋ*.

corresponding prenasalised stop if the  $C_0$  slot is empty, but not if it is filled. Thus we find *dama-ŋ* ‘my father’ (where  $C_1 = \eta$ ), but *da<sup>m</sup>ba* ‘his father’ (where  $C_0$  is empty). What is interesting here is that when the word ends in a glottal stop, the rule still applies, as if the  $C_0$  slot were empty: *ga<sup>m</sup>bɔʔ* ‘sore (on skin)’ (cf. Yabem *kamɔʔ*). In other words, the Bukawa rule does not treat the glottal stop as a consonant phoneme. Whilst we cannot argue directly that what is true in Bukawa is also true of Yabem, the history of Yabem also provides good grounds for inferring that the glottal stop is a syllabic feature rather than a consonant phoneme.

The first constraint on the distribution of Yabem phonemes is a constraint on syllable-structure (and one shared by a number of Austronesian languages in Papua New Guinea). A labialised consonant (whether labial or velar) may only be followed by one of the unrounded vowels *i*, *e*, *ɛ*, *a*, and never by one of the rounded vowels *ɔ*, *o*, *u*. For example, there are a number of inalienably possessed nouns which show an alternation between *-a* ‘third person singular’ and *-ɔʔ* ‘first person singular’, as in *tama* ‘his father’ vs. *tamɔʔ* ‘my father’. Where  $C_1$  is labialised in the *-a* form (and in other forms), this labialisation does not occur before *-ɔʔ*:

<i>tek<sup>w</sup>a</i>	‘his bone’	<i>tɛkɔʔ</i>	‘my bone’
<i>lawa</i>	‘his father-in-law’	<i>laɔʔ</i>	‘my father-in-law’

From this alternation we may infer that it is the rounded vowel which precludes a preceding labialised consonant. But we can rephrase this statement a little more elegantly if we recognise that labialisation of consonants and roundness of vowels both entail lip-rounding, and are reducible to a single feature which we will label “R”, for ‘rounding’. We can then say that the feature R may occur only once in a syllable and that  $V_i^R$  precludes  $C_i^R$ .

The examples above also serve as an introduction to the structure of the vowel system and to vowel harmony in Yabem. The paradigm of inalienably possessed nouns is set out below:

		‘body’	‘jaw’	‘face’	‘nose’	‘father’
Sing	1	<i>oliʔ</i>	<i>aseʔ</i>	<i>laŋoʔ</i>	<i>lusuʔ</i>	<i>tamɔʔ</i>
	2	<i>olim</i>	<i>asem</i>	<i>laŋom</i>	<i>lusum</i>	<i>tamam</i>
	3	<i>oli</i>	<i>ase</i>	<i>laŋo</i>	<i>lusu</i>	<i>tama</i>
Plur	1, 3	<i>oliŋ</i>	<i>aseŋ</i>	<i>laŋoŋ</i>	<i>lusuŋ</i>	<i>tameŋ</i>
	2	<i>olim</i>	<i>asem</i>	<i>laŋom</i>	<i>lusum</i>	<i>tamem</i>

The five nouns in this paradigm represent, from left to right, nouns whose unaffixed (third person singular) forms end in *-i*, *-e*, *-o*, *-u*, and *-a*. There are no nouns in *-ε* or *-ɔ*. Instead, *ε* and *ɔ* occur as replacements of *a* in the paradigm of nouns in *-a* represented by *tama* ‘father’. In the case of *ε*, it is clear that the vowel replacement is not the result of conditioning by a neighbouring segment, since *tamam* ‘your (sing.) father’ and *tamem* ‘your (plur.) father’ contrast only in the vowel. The simplest interpretation of this contrast is that the morpheme for ‘your (sg)’ is plain *-m*, whereas the morpheme for ‘your (pl)’ is a sequence consisting of a feature “F” (for ‘fronting’) plus *-m* (and for ‘our/their’ a sequence of “F” plus *-ŋ*). We have already noted that *ɔ* contains the feature “R” (for ‘rounding’). Since *ε* and *ɔ* do not form noun paradigms of their own, alternate with *a* in the paradigm above, and are of substantially lower frequency than the other five vowels, we may infer that their status is different from that of the other five vowels. We may treat the Yabem vowel paradigm as having three levels (high, mid and low), rather than four, and account for *ε* and *ɔ* in the paradigm of nouns in *-a* by the addition to *a* of “F” and “R” respectively.<sup>1</sup>

This account of *ε* and *ɔ*, however, works only for  $V_1$ . In positions  $V_{2...n}$  something rather different occurs, as the paradigm of *lema* ‘hand’ shows:

Sing	1	<i>lεmɔ?</i>
	2	<i>lemam</i>
	3	<i>lema</i>
Plur	1, 3	<i>lεmεŋ</i>
	2	<i>lεmem</i>

*ε* occurs as  $V_2$  whenever  $V_1$  is *ε* or *ɔ*, i.e.  $V_1$  triggers regressive vowel harmony in  $V_2$ . However, *ε* in  $V_2$  is not an alternant of *a* (as it is in  $V_1$ ) but of *e*.

- Support for this interpretation is found in the fact that the reconstructible Proto Huon Gulf prefixes are:

	Singular.	Plural
1	*- <i>gu</i>	*- <i>mi</i>
2	*- <i>m</i>	*- <i>mi</i>
3	*- <i>na</i>	*- <i>di</i>

Thus Yabem *R + -?* ‘first singular’ acquired its ‘R’ by assimilation of *\*a* to the vowel of *\*-gu*, whilst *F + -ŋ* ‘first/third plural’ and *F + -m* ‘second plural’ acquired their “F” by assimilation of *\*a* to the vowel of *\*-mi* and *\*-di* respectively. However, a more formal account would need to take account of the fact that the features “F” and “R” do not give rise to alternants where we might expect them in the paradigms of nouns in *-i*, *-e*, *-o*, and *-u*.

We would expect that if  $V_2 e$  becomes  $\varepsilon$  before  $V_1 \varepsilon$  or  $\text{ɔ}$ , then  $V_2 o$  should become  $\text{ɔ}$  in the same environment. I have found no inalienably possessed nouns where  $V_2$  is  $o$ , but this expectation is confirmed in verbal paradigms. As in many Oceanic Austronesian languages, the verb in Yabem appears in two moods, realis and irrealis, and the stem takes a prefix which indicates the person and number of the subject and the mood of the verb. The paradigm of *-deŋ* ‘move towards’ is as follows:

		realis	irrealis
Sing	1	<i>ga-deŋ</i>	<i>ya-<sup>n</sup>deŋ</i>
	2	<i>go-deŋ</i>	<i>o-<sup>n</sup>deŋ</i>
	3	<i>ge-deŋ</i>	<i>e-<sup>n</sup>deŋ</i>
Plur	1 incl	<i>da-deŋ</i>	<i>da-<sup>n</sup>deŋ</i>
	1 excl/2	<i>a-deŋ</i>	<i>a-<sup>n</sup>deŋ</i>
	3	<i>se-deŋ</i>	<i>se-<sup>n</sup>deŋ</i>

However, when  $V_1$  of the verb stem is either  $\varepsilon$  or  $\text{ɔ}$ , regressive vowel harmony applies, and all instances of  $e$  and  $o$  in the prefixes are replaced respectively by  $\varepsilon$  and  $\text{ɔ}$ . Hence the paradigm of *-deŋ* ‘put (something on a shelf)’ is:

		realis	irrealis
Sing	1	<i>ga-deŋ</i>	<i>ya-<sup>n</sup>deŋ</i>
	2	<i>gɔ-deŋ</i>	<i>ɔ-<sup>n</sup>deŋ</i>
	3	<i>gɛ-deŋ</i>	<i>ɛ-<sup>n</sup>deŋ</i>
Plur	1 incl	<i>da-deŋ</i>	<i>da-<sup>n</sup>deŋ</i>
	1 excl/2	<i>a-deŋ</i>	<i>a-<sup>n</sup>deŋ</i>
	3	<i>sɛ-deŋ</i>	<i>sɛ-<sup>n</sup>deŋ</i>

All instances of  $\varepsilon$  and  $\text{ɔ}$  in Yabem can thus be viewed as alternants for  $V_1 a$  (with the addition of fronting or rounding) or for  $V_{2...n} e$  and  $o$  (resulting from lowering through regressive vowel harmony).

Another form of vowel harmony is visible in the paradigms of *lusu* ‘nose’ and *debu* ‘grandfather’:<sup>1</sup>

		‘nose’	‘grandfather’
Sing	1	<i>lusu?</i>	<i>debu?</i>
	2	<i>lusum</i>	<i>debom</i>
	3	<i>lusu</i>	<i>debu</i>

1. To my knowledge, this aspect of Yabem vowel harmony has not been noted previously.

Plur	1, 3	<i>lusug</i>	<i>debug</i>
	2	<i>lusum</i>	<i>debom</i>

It is a general rule of Yabem syllable structure that if  $C_0$  is a bilabial ( $p$ ,  $b$ , or  $m$ ),  $V_1$  cannot be  $u$ , but is replaced by  $o$ . Thus instead of expected \**debum* ‘your (sing./pl.) grandfather’, we find *debom*, and this is the usual suffixation for nouns in  $-u$ . This replacement does not occur, however, if  $V_2$  is  $u$ , as in *lusu* ‘nose’. In other words, there appears to be a progressive vowel harmony condition such that  $u$  at  $V_2$  requires  $o$  at  $V_1$  to be replaced by  $u$ .

If this inference is correct, then we might expect it to apply equally to front and back vowels, i.e. we might expect that either  $i$  or  $u$  at  $V_2$  would require  $e$  at  $V_1$  to be replaced by  $i$ , and  $o$  at  $V_1$  to be replaced by  $u$ . In fact there are no paradigms which allow us to test out this condition in the way we have done above. However, it is supported by distributional evidence. Within the simple word, neither  $i$  nor  $u$  at  $V_2$  is ever followed by  $e$  or  $o$  at  $V_1$ .

In summary, Yabem has two forms of vowel harmony, which are in a sense the mirror image of each other:

harmony type:	regressive	progressive
triggered by:	$V_1 \varepsilon, \varnothing$	$V_2 i, u$
applies to:	$V_2 e, o$	$V_1 e, o$
results in:	$V_2 \varepsilon, \varnothing$	$V_1 i, u$
resulting cooccurrence conditions within a simple word:	If $V_1 = \varepsilon, \varnothing$ , then $V_2 = i, \varepsilon, a, \varnothing, u$ ( $V_2 \neq e, o$ )	If $V_2 = i, u$ then $V_1 = i, \varepsilon, a, \varnothing, u$ ( $V_2 \neq e, o$ )
phonetic change:	lowering	raising

Yabem not only has vowel harmony, but also tone harmony. There is no interaction between these two systems.

Tone is a feature of the simple word in Yabem. In a simple word of two syllables ( $C_2V_2C_1V_1[C_0]$ ), the two share the same tone. There is a single binary distinction between high tone and low tone, and a simple word therefore has either high tone or low. Any stop in a high-tone syllable is voiceless ( $p, p^w, t, k, k^w$ ), whilst any stop in a low-tone syllable is voiced ( $b, b^w, d, g, g^w, mb, mb^w, nd, ng, ng^w$ ). Consonants other than stops may occur freely in both high-tone and low-tone syllables, with the exception of  $ns$ , which is derived historically from voiced \*[ $^nz$ ] and so occurs only in low-tone syllables. In the word list the orthographic convention for tone recommended (but not always followed) by Streicher (1982) is followed, whereby only low tone is marked (with a grave accent over the first vowel of

the simple word) and only where required (i.e. where there is no voiced stop or <sup>h</sup>s in the simple word).

From the voicing condition on stops, it follows that minimal pairs distinguished only by tone will not contain any stops. Such pairs are:

<i>awa</i>	‘valuables’	<i>àwa</i>	‘(his/her) mouth’
<i>awe</i>	‘outside’	<i>àwe</i>	‘woman’
<i>oli</i>	‘body’	<i>òli</i>	‘wages’
<i>yao</i>	‘prohibition’	<i>yào</i>	‘enmity’
<i>wa</i>	‘mango’	<i>wà</i>	‘crocodile’
<i>-sa<sup>h</sup></i>	‘hammer’ (verb)	<i>-sà<sup>h</sup></i>	‘put on top of’

Where stops occur, minimal pairs are distinguished simultaneously (redundantly) by both tone and voicing:

<i>paliŋ</i>	‘careless’	<i>baliŋ</i>	‘far away’
<i>piŋ</i>	‘shell’	<i>biŋ</i>	‘speech’
<i>tip</i>	‘all at once’	<i>dib</i>	‘thud’
<i>sakiŋ</i>	‘service’	<i>sagiŋ</i>	‘house partition’

Above we gave the paradigms of the verbs *-deŋ* ‘move towards’ and *-deŋ* ‘put (something on a shelf)’. Both are low-tone stems and, since the prefixes are part of the simple word, they have low tone prefixes with voiced stops.

However, where a verb-stem is high-tone, it takes high-tone prefixes with voiceless stops. Compare the paradigms of *-taŋ* ‘weep’ and *-teŋ* ‘ask, beg’ with those above:

		realis	irrealis
Sing	1	<i>ka-taŋ</i>	<i>ya-taŋ</i>
	2	<i>ko-taŋ</i>	<i>o-taŋ</i>
	3	<i>ke-taŋ</i>	<i>e-taŋ</i>

		realis/irrealis	
Plur	1 incl	<i>ta-taŋ</i>	
	1 excl /2	<i>a-taŋ</i>	
	3	<i>se-taŋ</i>	

		realis	irrealis
Sing	1	<i>ka-teŋ</i>	<i>ya-teŋ</i>
	2	<i>kɔ-teŋ</i>	<i>ɔ-teŋ</i>
	3	<i>ke-teŋ</i>	<i>ɛ-teŋ</i>

		realis/irrealis
Plur	1 incl	<i>ta-tɛŋ</i>
	i excl/2	<i>a-tɛŋ</i>
	3	<i>sɛ-tɛŋ</i>

There is one complication in the application of tone, namely that in three-syllable simple words, the first syllable (C<sub>3</sub>V<sub>3</sub>) is always high tone.<sup>1</sup> As we observed above, three-syllable simple words are quite rare, and consist mainly of verb forms where the subject prefix is added to a two-syllable verb stem. For example, with a low-tone two-syllable verb stem such as *-dam<sup>w</sup>e* ‘lick’, we do not find *\*go-dam<sup>w</sup>e* ‘you (sing) licked’, but *ko-dam<sup>w</sup>e*. Thus whereas vowel harmony affects all syllables of a simple word, tone harmony affects only the last two.

Since the voicing of stops is dependent on tone, it follows that all stops in a simple word are either voiceless or voiced, i.e. tone harmony results in “stop harmony”. There are, however, two other kinds of consonant harmony in Yabem which are independent of tone harmony.<sup>2</sup> Streicher (1982: 634) notes that the third person plural subject prefix, which is normally *se-* or *sɛ-* (as in *se-som* ‘they speak’, *sɛ-kɛkɔ* ‘they scratch’), may change in form to *te-*, *tɛ-* before verbs with stem-initial *t-* and to *de-*, *dɛ-* before verbs with stem-initial *d-*. Thus verb forms like those listed above *se-dɛŋ* ‘they moved towards’, *sɛ-<sup>n</sup>dɛŋ* ‘they will move towards’, *sɛ-dɛŋ* ‘they put (something on a shelf)’, *sɛ-<sup>n</sup>dɛŋ* ‘they will put (something on a shelf)’, *se-taŋ* ‘they wept/will weep’ and *sɛ-tɛŋ* ‘they asked/will ask’ may also occur as *de-dɛŋ*, *dɛ-<sup>n</sup>dɛŋ*, *dɛ-dɛŋ*, *dɛ-<sup>n</sup>dɛŋ*, *te-taŋ* and *tɛ-tɛŋ*. It appears, however, that the optional nature of this alternation is of recent origin: native simple words do not contain combinations of *s* and *t/d*, suggesting that until recently there was a consonant harmony condition preventing an alveolar fricative and an alveolar stop from co-occurring in a simple word.

The other consonant harmony condition arises from the fact that prenasalisation is a feature of the simple word, not of the single consonant: if a word contains consonants capable of prenasalisation (i.e. low-tone *s* or a voiced stop), then either all are prenasalised except the word-initial consonant, or none are prenasalised. Because word-initial consonants are never prenasalised, this rule manifests itself only in simple words of three syllables, i.e. mostly in verb forms.

1. This fact does not appear to have been noted in the literature before.
2. Again, these harmony conditions do not appear to have been noted elsewhere in the literature.

Prenasalisation in verbs is quite common, because the prenasalisation feature is the irrealis morpheme, as the paradigms of *-deŋ* ‘move towards’ and *-deŋ* ‘put (something on a shelf)’ above illustrate. The irrealis morpheme can only be attached, however, to verb stems which contain a consonant or consonants capable of prenasalisation. Hence it does not occur in the paradigms of *-taŋ* ‘weep’ and *-teŋ* ‘ask, beg’, since the voiceless stops like *t* cannot be prenasalised in Yabem. Since the irrealis morpheme is attached to a verb stem in which any of the consonants is capable of prenasalisation, we find realis/irrealis alternations like the following (all forms are first person singular):

Realis	Irrealis		
<i>ka-leti</i>	<i>ka-leti</i>	‘run’	(no prenasalisation)
<i>ka-dam<sup>w</sup>e</i>	<i>ka-<sup>n</sup>dam<sup>w</sup>e</i>	‘lick’	(C <sub>2</sub> prenasalised)
<i>ka-sàì?</i>	<i>ka-<sup>n</sup>sai?</i>	‘pull off, snap’	(C <sub>2</sub> prenasalised)
<i>ka-madom</i>	<i>ka-ma<sup>n</sup>dom</i>	‘break in two’	(C <sub>1</sub> prenasalised)
<i>ka-lèsu</i>	<i>ka-lè<sup>n</sup>su</i>	‘poke, stir’	(C <sub>1</sub> prenasalised)
<i>ka-dabiŋ</i>	<i>ka-<sup>n</sup>da<sup>m</sup>biŋ</i>	‘approach’	(C <sub>1</sub> and C <sub>2</sub> prenasalised)
<i>ka-gab<sup>w</sup>a?</i>	<i>ka-<sup>ŋ</sup>ga<sup>m</sup>b<sup>w</sup>a?</i>	‘untie’	(C <sub>1</sub> and C <sub>2</sub> prenasalised)

The last two alternations show the application of prenasalisation harmony.

The result of recognising that a number of the features which distinguish Yabem phonemes on a traditional analysis are better treated as features of the syllable or the word is that the basic Yabem system is seen to be quite simple. The simplifications to the consonant system are:

- ? is treated as a syllabic feature, so no glottal position occurs in the system;
- the voicing of stops is determined by tone, and so a voicing distinction need not be separately recognised;
- prenasalisation is a feature of the simple word, so prenasalised consonants do not need to be separately recognised.

This results in a reduction of the consonant system to the following:

	Labial	Labialised labial	Alveolar	Velar	Labialised velar
Stops	<i>p</i>	<i>p<sup>w</sup></i>	<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>
Fricatives			<i>s</i>		
Nasals	<i>m</i>	<i>m<sup>w</sup></i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Semivowels		<i>w</i>	<i>y</i>		

A more radical analysis might also eliminate the labialised consonants and even the fricative *s*, but these possibilities lie outside the scope of this introduction.

The simplification to the vowel system is that there are underlyingly only three levels: low, mid and high.

### 3. Notes on orthography

The Yabem orthography used by Dempwolff (1939) and Zahn (1940) was widely taught in the Lutheran mission's Yabem schools, with the result that it is still widely used not only to write Yabem, but also a large number of Austronesian languages in the Morobe Province where Yabem was used as the mission's *lingua franca*.

The orthography used in the Yabem word list in this work is based on the standard established for all the word lists herein, and is shown under the traditional analysis earlier in this introduction. With the exception of the labialised labials noted below, it corresponds symbol for symbol to the Yabem orthography. I will note here only those instances where the two orthographies differ.

The differences between the two orthographies' renderings of the Yabem vowel system are a source of potential confusion:

The present work	Dempwolff/Zahn
<i>e</i>	<i>ê</i>
<i>ɛ</i>	<i>e</i>
<i>ō</i>	<i>ô</i>
<i>ɔ</i>	<i>o</i>

Among the consonants there are only two outright differences:

The present work	Dempwolff/Zahn
<i>y</i>	<i>j</i>
<i>ʔ</i>	<i>c</i>

In all cases where a prenasalisation is written with a superscript symbol (<sup>*m*</sup>*b*, <sup>*n*</sup>*d*, <sup>*ŋ*</sup>*g*, <sup>*n*</sup>*s*) in the present work, it is written without superscription in the Dempwolff/Zahn orthography (*mb*, *nd*, *ng*, *ns*). Similarly, where a labialised velar is marked with a superscript (<sup>*w*</sup>*k*, <sup>*w*</sup>*g*) in the present work, it is written without superscription in the Dempwolff/Zahn orthography (*kw*, *gw*). However, where a labialised labial is marked with a superscript (<sup>*w*</sup>*p*, <sup>*w*</sup>*b*, <sup>*w*</sup>*m*) in the present work, Dempwolff and Zahn write a sequence of labial plus

rounded vowel, the latter matching the following vowel in height. For example:

The present work	Dempwolff/Zahn	
<i>tem<sup>w</sup>i</i>	<i>têmui</i>	‘dirty’
<i>om<sup>w</sup>eŋ</i>	<i>omôêŋ</i>	‘you (sing.) will come’
<i>kap<sup>w</sup>eŋ</i>	<i>kapôêŋ</i>	‘big’
<i>lep<sup>w</sup>a</i>	<i>lêpoa</i>	‘rope’
<i>m<sup>w</sup>a?</i>	<i>moac</i>	‘snake’
<i>sab<sup>w</sup>a?</i>	<i>saboac</i>	‘potsherd; spleen’

Why Dempwolff chose to write the labialised labials (but not the labialised velars) in this way is unclear: he knew that the first vowel of his written sequences was non-syllabic and that it did not participate in vowel harmony (Dempwolff 1939: 5, 7, 13, 15). For example, Dempwolff wrote *lêpoa* ‘rope’ (our *lep<sup>w</sup>a*), recognising that the quality of his *-ê-* harmonises with *-a*, not his *-o-*.

#### 4. Notes on morphology and syntax

A number of major features of Yabem morphology were dealt with in Section 2 above. The purpose of this section is simply to note briefly further features of morphology which are relevant to an understanding of the word list. Further details are to be found in Bisang (1986), Bradshaw (1980), Grüniger (1986), Streicher (1982), and especially Dempwolff (1939) and Zahn (1940).

The verb paradigms of Yabem are divided by Dempwolff, Zahn, and Streicher into five “conjugations”:

- 1) verbs whose stems have one syllable and high tone: for example, *-taŋ* ‘weep’ and *-teŋ* ‘ask, beg’, above;
- 2) verbs whose stems have one syllable and low tone: for example, *-deŋ* ‘move towards’ and *-deŋ* ‘put (something on a shelf)’, above;
- 3) verbs whose stems have one syllable and mixed tone (see below);
- 4) verbs whose stems have two syllables: some, like *-leti* ‘run’, have high tone; others, like *-dam<sup>w</sup>e* ‘lick’, have low tone, but all take high-tone subject prefixes (see discussion above);
- 5) verbs whose stems have one syllable and low tone, but take high-tone subject prefixes (see below).

Conjugations 1, 2 and 4 are discussed in Section 2. Conjugation 3, the “mixed tone” conjugation, is exemplified by *-li?* ‘see’, below, and includes

all stems of one syllable whose  $C_1$  is neither a stop nor *s*. Here, the realis singular forms have low tone, and all other forms have high tone:<sup>1</sup>

		realis	irrealis
Sing	1	<i>ga-liʔ</i>	<i>ya-liʔ</i>
	2	<i>go-liʔ</i>	<i>o-liʔ</i>
	3	<i>ge-liʔ</i>	<i>e-liʔ</i>
Plur	1 incl	realis/irrealis <i>ta-liʔ</i>	
	1 excl /2	<i>a-liʔ</i>	
	3	<i>se-liʔ</i>	

There are a number of verbs belonging to this conjugation whose final bilabial stop changes in accordance with the tone of the form. For example, we find *ge-rob* ‘he flew’ but *e-rop* ‘he will fly’.

Conjugation 5, verbs whose stems have one syllable and low tone, but unexpectedly take high-tone subject prefixes, are assumed to have once belonged to Conjugation 4, i.e. to have once had two syllables.<sup>2</sup>

We took the concept of the “simple word” for granted in Section 2. In fact, it is a little more problematic than we imply there. Yabem has many compound words, i.e. words which can be readily segmented into two (or more) simple words or clitics, and many of these are footnoted in the word list. However, there are also words which are phonologically not “simple”, but which cannot be segmented into their constituent parts. For example *atali* ‘pocket’ has two high-tone and one low-tone syllable, suggesting the components *ata* and *li*, neither of which exists independently today. Similarly *loʔgom* ‘nettle tree’ has internal *ʔ* and disharmonic vowels, indicating *loʔ* (which is indeed a kind of tree) and *gom* (not found today). Yabem is evidently approaching that stage in the development of a tone language where phonological attrition has resulted in so many homophones that

1. Synchronically, tone determines the voicing of stops and is a necessary condition of the voicing and prenasalisation of stops and the prenasalisation of *s*. Historically, however, the reverse is true: the voicing of stops and of Proto North Huon Gulf *\*s/\*z* determined tone. Conjugation 3 includes stems whose  $C_1$  is neither a stop nor *s*, and the voicing of each form has been determined historically by the presence/absence of a voiced stop in the prefix.
2. This is demonstrably true of one member of this small class: *-suj* ‘bury’ is descended from a two-syllable form reconstructible as Proto North Huon Gulf *\*-zuvuŋ*.

compounding becomes a norm – which in the Yabem will result in profound changes in the phonological system described above.

There are three enclitics which occur usually in compound nouns denoting human beings:

(a) *-ə* ‘feminine’, attached to human nouns; for example:

*lau-ə* ‘wives’ (cf. *lau* ‘people’)

*latom-ə* ‘your daughter’ (cf. *latom* ‘your son’, *latu* ‘his son’)

*sagu-ə* ‘girl who has menstruated’ (cf. *sagu* ‘circumcision candidate’)

*ana-ə* ‘her co-wife’ (\**ana* does not occur independently);

(b) *-i* ‘human plural’, attached to human nouns; for example:

*tamem-i* ‘your (plural) fathers’;

*tɛnɛŋ-i-ageʔ* ‘our (pairs of) parents’ (cf. *tena-ageʔ* ‘his (pair of) parents’, where *tena* is ‘his mother’, *-ageʔ* a clitic meaning ‘pair, both’);

*ana-i-ə* ‘her co-wives’ (cf. *ana-ə* ‘her co-wife’, where *-ə* is the feminine enclitic)

(c) *-waga* ‘human agent’, attached to nouns, adjectives and verbs; for example:

*yaom-waga* ‘foster parents’ (cf. *yaom* ‘guardianship’)

*su-waga* ‘natural father’ (cf. *su* ‘milk’)

*yali-waga* ‘sentry, guard’ (cf. *yali* ‘awake at night’)

*ke-doŋ-waga* ‘teacher’ (cf. *ke-doŋ* ‘he teaches’)

As in many Oceanic Austronesian languages, Yabem nouns are divisible morphologically into two categories: alienably possessed nouns, which are unsuffixed, and inalienably possessed nouns, which normally take a suffix marking the person and number of the possessor. Paradigms of the latter are given in Section 2 (q.v.). In Yabem, however, a distinction is also made within the inalienably possessed category between cases where the possessor is a human being and cases where it is non-human. Where the possessor is a human being, the possessor noun phrase precedes the (suffixed) possessed noun:

*aom kato-m* ‘your (sing.) soul’ (*aom* ‘you (sing.)’; *kato* ‘his soul’)

*luluai latu* ‘the *luluai*’s [village head man’s] son’ (*latu* ‘his son’)

*yam<sup>wa</sup> tama* ‘Yamwa’s father’ (*tama* ‘his father’)

Perhaps because the third person singular possessor “suffix” in Yabem is zero,<sup>1</sup> when the possessor is not a human being (and occasionally when it is), the proclitic *ŋa-* is attached to the possessed noun:

<i>ka ŋa-laka</i>	‘tree branch, branch of a tree’ ( <i>ka</i> ‘tree’; <i>laka</i> ‘its branch, twig’)
<i>taleʔ ŋa-latu</i>	‘hen’s child, chick’ ( <i>taleʔ</i> ‘hen’; <i>latu</i> ‘her son’)
<i>a<sup>n</sup>du ŋa-dam<sup>w</sup>e</i>	‘back of the house’ ( <i>a<sup>n</sup>du</i> ‘house’; <i>dam<sup>w</sup>e</i> ‘its back’)
<i>lom ŋa-tau</i>	‘owners of the men’s house’ ( <i>lom</i> ‘men’s house’; <i>tau</i> ‘person, self’)

This construction, which is quite unusual among Oceanic Austronesian languages, has three outcomes which are reflected in the word list. Firstly, it is used in a number of portmanteau expressions, e.g. *mu ŋa-ðla* ‘the wind’s blossom, i.e. white caps caused by wind’, *bu ŋa-tɔŋ* ‘water’s heap, i.e. lake’. Secondly, there are a number of nouns which hardly, if ever, occur without *ŋa-* (e.g. *ŋawao* ‘feather, flame’, shortened from *mɔʔŋawao* ‘bird’s feather’, *ya ŋawao* ‘fire’s flame’) or which have acquired a different meaning when prefixed with *ŋa-*:

<i>ŋaoliʔ</i> ‘(its) skin’	<i>oli</i> ‘his body’ <sup>2</sup>
<i>ŋapale</i> ‘child, offspring’	<i>pale</i> ‘soft’
<i>ŋaseʔ</i> ‘afterbirth, baby’	<i>seʔ</i> ‘bad’

Thirdly, as is fairly common in Western Oceanic languages, some attributive adjectives in Yabem behave as if they were the inalienably possessed head noun of a possessive noun phrase, so that we also find adjectives with *ŋa-*, as in *m̄ ŋakana ŋayàm* ‘a lovely sweet banana’ (*m̄* ‘banana’, *ŋakana* ‘sweet, tasty’, *ŋayàm* ‘good’).<sup>3</sup>

Unrelated to *ŋa-* ‘possessive proclitic’ is *-ŋa* ‘postpositional enclitic’, which also occurs quite frequently in the word list and footnotes and is used to express a number of relationships: locative, ablative, benefactive, and purposive:

locative:	<i>ano-ŋa</i> ‘on the right’
ablative:	<i>ŋa-dem<sup>w</sup>e-ŋa</i> ‘its-back-ablative’ = ‘from behind it’
purposive:	<i>gasuʔ dauŋ-ŋa</i> ‘bamboo smoke-for’ = ‘pipe (for smoking)’

1. The third person singular form in many Oceanic Austronesian languages has a suffix derived from Proto Oceanic \**-ña*. Yabem is a little unusual in having no suffix here.

2. The final glottal stop of *ŋa-oliʔ* is unexpected, but probably derived from a Proto Huon Gulf construct suffix \**-c* (Ross 1988: 145-146).

3. Constructions of this kind are discussed by Ross (1988: 184-185, 287-290, 390).

benefactive: *tama ke-po mɔ ɛŋ-ŋa* ‘father he-arrange taro him-for’, i.e. ‘his father who looks after him’ = ‘stepfather’

One of the most interesting features of the Yabem clause is the frequent use of verb serialisation, which is illustrated in a number of the footnotes to the word list. However, Yabem verb serialisation has been well described in the literature (by Bisang 1986, Bradshaw 1980, and Dempwolff 1939) and restrictions of space prevent us from recapitulating this work here. A feature which needs further research is the presence in Yabem of a class of morphemes which fill the slot of the second verb in a serial construction but are morphologically invariable. These appear to be the fossils of verbs which once filled the second serial slot but which no longer occur as independent verbs. They are often difficult to gloss except in combination with the verbs with which they co-occur, and are exemplified in Streicher (1982) under the entries for *au?* (no gloss), *lase* ‘away, from’, *okwi* ‘about, around’, *sa* ‘up, out, off’, *siŋ* ‘away’, *si?* ‘off course, astray’, *su* ‘away, off, out’, *toŋ* ‘fast’.<sup>1</sup>

Introduction:	<i>Craig Throop – Malcolm D. Ross</i>
---------------	---------------------------------------

Word list:	<i>Craig Throop</i>
------------	---------------------

---

### 1. Introduction

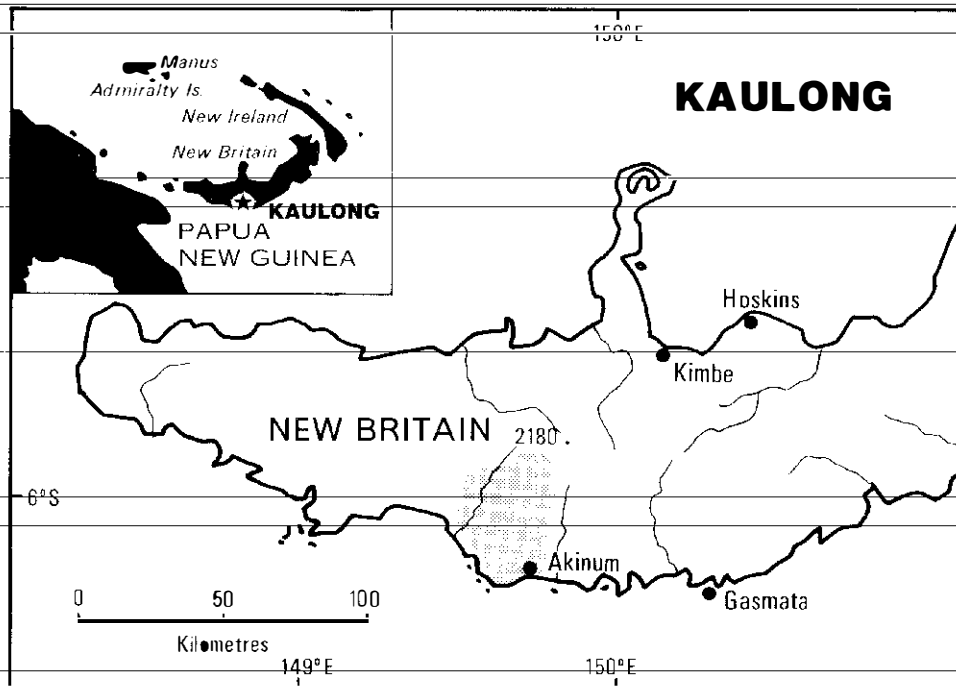

---

Kaulong is spoken by some four thousand people who inhabit the area between the Alimbit and Palix Rivers, as well as a number of villages east of the Palix, from the coastal hinterland to the base of the Whiteman mountain range in the south-central part of the West New Britain Province of Papua New Guinea. Numerically Kaulong is the dominant member of the Pasismanua chain of languages, spoken to the south of the Whiteman range and including, from west to east, Miu, Kaulong, Sengseng, Karore and Psohoh.<sup>1</sup> Of these, Miu (to the north-west of Kaulong), Kaulong itself, and Sengseng (spoken along the Andru River to the east of Kaulong) are very closely related to each other, such that a linguist might regard them as dialects of a single language, although their speakers perceive them as separate languages.<sup>2</sup>

The region occupied by Miu, Kaulong and Sengseng speakers consists of the foothills of the Whiteman range, varying in altitude from eighty to six hundred metres. Geologically the area consists primarily of a limestone substratum with a fairly thin layer of topsoil which is far less fertile than the volcanic soils of northern New Britain and many of the other islands of Papua New Guinea. Most of the area is covered by tropical rain forest, interrupted only by village clearings, gardens, and a few small plantations. Traditionally, the people lived in scattered hamlets, although contact with the outside world has resulted in the establishment of some larger villages. Although north-eastern New Britain has a long history of European contact because the headquarters of the German Pacific empire was located there,

- 
1. More detailed information about these languages is provided by Throop – Throop (1980) and Chowning (1985).
  2. Numerically tiny Karore (once spoken along the Ursula River near the coast, and still spoken just offshore on Kaveng Island; Chowning 1985: 192) may also belong to this chain, but no data are available as the basis for determining this.
-

south-western New Britain remains one of the most isolated regions of Papua New Guinea. Much of the area came under government control only in the 1950s, and one effect of this is that Tok Pisin (the lingua franca of much of Papua New Guinea) is still much less well known here than in other parts of New Britain (Throop – Throop 1980; Chowning 1985).

*Map 46.* Kaulong language area

Miu, Kaulong and Sengseng speakers are culturally and linguistically distinct from their neighbours to the west and along the south coast, who speak languages belonging to the Arawe chain. Indeed, the Pasismanua languages have so little obviously Austronesian vocabulary (as an inspection of the Kaulong items in this volume will show) that their membership in the Austronesian family is not initially evident. However, as Chowning (1985) has demonstrated, there are very good reasons for identifying them as Austronesian languages, an identification which is confirmed by Ross (1988: 181-183). Morphosyntactically, the Pasismanua languages have a number of features which are characteristic of the Oceanic Austronesian languages of western Melanesia: Subject–Verb–Object constituent order; pronominal systems which distinguish singular, dual, paucal and plural, and have separate inclusive and exclusive first person non-singular forms; a distinction between inalienable possession, where the possessed noun takes a suffix marking the person and number of the possessor, and alienable possession,

with no suffixation; reflexes of the Proto Austronesian causative verbal prefix *\*pa-*; reduplication of the verb stem to show ongoing actions; and completed action marked by post-verbal *kut* (from Proto Oceanic *\*goti* ‘finish’) (Throop – Throop 1980: 229; Chowning 1985: 173-174). The only published grammatical description of a Pasismanua language at the time of writing is Chowning’s (1978) notes on Sengseng.

The apparent reduction of Austronesian vocabulary in Miu, Kaulong and Sengseng is attributable to several factors. One is the operation of name taboo, recorded in various parts of Melanesia (Chowning 1985). Of the nouns in the Kaulong list, a higher proportion than in other languages consists of nominalisations of verbs. These nominalisations, formed with the derivational suffix *-ŋin*, appear to have replaced earlier forms which have been tabooed. For example, we find *tinis-ŋin* ‘tears’, the nominalisation of *tinis* ‘cry’ (from Proto Oceanic *\*taŋis*) instead of a reflex of Proto Oceanic *\*luaq* ‘tears’. In many cases, however, replacement entails the operation of a probable second factor, namely borrowing from Papuan (i.e. Melanesian but non-Austronesian) languages. Although the few Papuan languages of New Britain are today spoken only in small pockets surrounded by Austronesian languages, the former are almost certainly the descendants of languages spoken widely on New Britain before the arrival of Austronesian speakers.<sup>1</sup> A piece of circumstantial evidence indicating contact between at least one Papuan language and a language ancestral to the Pasismanua languages occurs in the shape of one very un-Austronesian feature in Pasismanua grammar, namely that third person singular pronouns and pre-nominal articles distinguish between masculine and feminine gender of personal and some other nouns (Throop – Throop 1980; Ross 1988: 182-183). Since gender distinction is almost unknown among Oceanic Austronesian languages, but is found in Anêm, the only Papuan language in the western part of New Britain (Thurston 1982: 45-47), it is a reasonable hypothesis that the Pasismanua distinction results from Papuan contact, and that this contact also resulted in lexical borrowing. Thurston (1987: 89) cites a few cases where Anêm and Kaulong terms appear to share an earlier Papuan source:

Anêm <sup>2</sup>	Kaulong		Proto Oceanic
<i>êknîn</i>	<i>ekiŋ</i>	‘bird’	<i>*manuk</i>
<i>bîk</i>	<i>miuk</i>	‘three’	<i>*tolu</i>
<i>tanol</i>	<i>nal, mnal</i>	‘four’	<i>*pat, pati</i>

1. There is archaeological evidence of pre-Austronesian settlement on New Britain from at least 10,000 B.C. (Spriggs 1984).

2. Anêm /î/ and /ê/ are respectively high and mid back unrounded vowels.

In the case of *ekij* ‘bird’, the putative Papuan borrowing has not entirely replaced the Austronesian term, as Kaulong *emon* (from Proto Oceanic *\*manuk*) is also heard.

A third reason why Kaulong and Sengseng vocabulary items are not readily recognisable as Austronesian is simply the result of change over time. Thus it is not immediately obvious that Kaulong *nak* and Psohoh *noax* reflect Proto Oceanic *\*waga* ‘canoe’. However, when it is recognised that Pasismanua nouns often have a fossil prefix reflecting the Proto Oceanic article, in this case, *\*na*, the derivation is more evident.<sup>1</sup>

The relationships among the Austronesian languages of southern and south-western New Britain are not entirely clear, but it is probable that the closest relatives of the Pasismanua languages are their somewhat more conservative Arawe neighbours on the coast. Both groups belong to a larger South-West New Britain grouping, discussed by Ross (1988: 163, 181-183).

The Kaulong language itself appears to be divided into four dialects, which we will provisionally name northern, southern, eastern and western. The western dialect is spoken in villages just to the east of the Alimbit River, whilst the rest of the region between the Alimbit and the Palix is occupied by the northern and the southern dialects. The Palix River divides the eastern dialect from the other three. These divisions are based on the statements of native speakers. Linguistic data collected so far corroborate the sociolinguistic evidence, but more data are needed to determine more exactly the nature and extent of the differences. The data in this volume are from Au village, which lies within the northern dialect.

Identifiable borrowings into Kaulong are footnoted in the word list. However, as noted above, many items in the list appear to be the result of borrowing from a pre-Austronesian language or languages, and their origins will probably never be identified. Footnoted borrowings come from two sources. Items related to life in a coastal environment come from one or more of the Arawe dialects of the Kaulong speakers’ coastal neighbours, since no Kaulong villages lie on the coast (Kaulong has no word, for example, for 01.341 ‘reef’). A number of items resulting from European contact are from Tok Pisin (New Guinea Pidgin, the *lingua franca* of much of Papua New Guinea), which is slowly gaining currency in south-western New Britain. Even some of these items, however, seem to have been borrowed via another New Britain language, perhaps Tolai, since they are prefixed with an apparent article *a-*: *asop* ‘soap’, *akon* ‘corn’, *abuk* ‘hook’.

1. This derivation is complicated by the fact that the item is probably borrowed from a neighbouring Arawe language on the coast.

Certain frequent features in the items in the word list are noted here, rather than repeatedly footnoted. Many body part and kinship nouns are inalienably possessed, and take a suffix indicating the person and number of their possessor. These suffixes are segmented with a hyphen. For example, in 01.820 *iya mamai-n* ‘flame’, literally ‘fire’s tongue’, *iya* ‘fire’ is possessor, and the *-n* of *mamai-n* ‘its tongue’ is the third person singular suffix coreferential with *iya*. Similarly the *-k* of 02.630 *βiyo-k* ‘my son-in-law’ marks the possessor ‘my’. Possessor suffixes found in the word list are *-k* and *-ŋo* ‘my’, *-n* ‘his/her/its’, *-hi* ‘their’. Less frequently found is *-an* ‘his/her/its (inalienable)’, added to nouns which may also be used without inalienable possession. Thus 04.150 *kalol-an* ‘his/her blood’ is formed from the independent noun *kalol* ‘blood’.

Another grammatical morpheme occurring in the word list is the third person singular inanimate object marker *-i*, found in 21.250 *tuntun-i* ‘swear it’ (from 21.240 *tuntun* ‘swear’) and frequently (for example in 09.341) in *βa-i* ‘carry it’.

Derivational suffixes which occur often are the nominaliser *-ŋin*, referred to above, and the attributive suffix *-an*. The attributive suffix (historically identical to *-an* ‘his/her/its’) forms attributes from nouns. Thus in 14.450 *pi sinaŋ-an* ‘noon’, *pi* ‘place, time’ is the head noun, and *sinaŋ-an* is an attribute formed from *sinaŋ* ‘sun’.

This example illustrates a feature which is peculiar to Kaulong, namely that items rendered in other languages by a single word are often a phrase in Kaulong. As far as possible, the constituent morphemes of a phrase are glossed in a footnote, but sometimes the individual meaning of a constituent is unclear. This tendency to circumlocution is probably attributable to the factors discussed above, i.e. word tabooing and Papuan influence. One subtype of circumlocution which is atypical for Austronesian languages but which has been reported elsewhere as a Papuan feature is the use of a hypernymous noun with a more specific noun attribute (Laycock 1973). A clear example of this is provided by the bird types listed as 03.520 to 03.596, each consisting of *ekiŋ* ‘bird’ and a more specific noun. We find, for example, *ekiŋ nomal* ‘chicken’, *ekiŋ βisu* ‘eagle’, *ekiŋ kalaŋ* ‘parrot’, *ekiŋ βulus* ‘dove’. Kaulong *kalaŋ* and *βulus* are derived respectively from Proto Oceanic *\*kalaŋaR* ‘Eclectus parrot’ and *\*baluc* ‘dove’. Since lexical replacement has not occurred here, we can be confident that the structure is not the result of taboo, but probably of Papuan influence. The numerous cases introduced by *pi* ‘place’ (but also used of times) represent a similar structure, although some probably are the result of tabooing: for example 01.222 *pi po iyop-ŋin* ‘place for jump-ing’ = ‘cliff, precipice’, 01.250

*pi nemut* ‘place cut-off’ = ‘island’, 01.343 *pi hut* ‘place nose’ = ‘headland’, 01.450 *pi kin* ‘place leaf’ = ‘earthquake’, 14.450 *pi sinaŋ-an* ‘place sunn-y’ = ‘noon’.

The presence of gender in Kaulong personal nouns was mentioned above. In kinship nouns this is expressed by a prefix which was originally a hypernymous noun. Thus *βi-tama-n* ‘his father’ consists of the prefixed noun *βi* ‘man, male’ and a reflex of Proto-Oceanic \**tama-ã* ‘his father’. Originally this *βi* functioned structurally like *ekiŋ* and *pi* in the previous paragraph. Similarly, we find 02.410 *βi-tu-k* ‘son’, 02.480 *βi-ro-k* ‘grandson’. The corresponding female terms are formed with *e-*: 02.420 *e-tu-k* ‘daughter’, 02.490 *e-ro-k* ‘granddaughter’. This *e-* is a reduction of *et-*, no longer an independent morpheme in Kaulong, but reconstructible as Proto-Arawe/Pasismanua \**et* ‘woman, female’. This gender distinction is foreign to Austronesian languages, and results in considerable complexity in Kaulong kin terms when it is superimposed on an inherited classificatory system which distinguishes the sex of the person through whom the referent is related to ego. Thus the distinction between *βi-* ‘male’ and *et-* ‘female’ combines with a distinction between *-iyo-* ‘wife’s parent/daughter’s husband’ and *-ka-* ‘husband’s parent/son’s wife’ to give:

02.610, 630, 631 *β-iyo-k* ‘(man’s) father-in-law, man’s or woman’s son-in-law’

02.620 *et-iyo-k* ‘(man’s) mother-in-law’

02.611 *βi-ka-ŋo* ‘(woman’s) father-in-law’

02.621, 641 *et-ka-ŋo* ‘(man’s) father-in-law, woman’s daughter-in-law’

This system is not completely symmetrical, since we also find 02.640 *βut-ka-ŋo* ‘(man’s) daughter-in-law’, where the prefix is *βut*, the independent noun ‘woman’, rather than *et-*, a distinction that is not properly understood.

## 2. Notes on phonology

The consonant phonemes of Kaulong are:

Table 1. Consonants

		Labial	Alveolar	Velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>	
	vd	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives		<i>β</i>	<i>s</i>		<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels			<i>y</i>		

The voiced stops are always prenasalised as [ʰb], [ʰd], [ʰg], but it would be redundant to write the prenasalisation in the word list. The bilabial is phonetically a fricative [β] before /i/, /e/ and /o/, a rounded semivowel [w] before /u/, and varies between [β] and [w] before /a/. The voiceless stop /t/ is articulated as a voiced tap [ɾ] between vowels and between a vowel and another consonant in rapid speech. Intervocalic /h/ is deleted in rapid speech in some dialects. With regard to /y/, see below under vowels.

Consonant clusters occur in Kaulong with somewhat greater frequency than is the norm in Oceanic Austronesian languages. At least some word-initial consonant sequences appear to be the result of vowel deletion. For example, Kaulong *βlek* ‘plant upright’ is cognate with Sengseng *velek*. However, more research is needed to determine the psychological status of the deleted segment in Kaulong.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

The front vowels /i/ and /e/ are lowered to [ɪ] and [ɛ] in closed unstressed syllables, and are [i] and [e] elsewhere.

In general, falling vowel sequences form the nuclei of two syllables, whilst rising sequences are monosyllabic. However, there are some uncertainties in this area, a fact which has a bearing on whether the consonant phoneme /y/ should be recognised, or whether [y] is an

allophone of [i] or a non-phonemic intervocalic glide in falling sequences, e.g. [iyo] reflecting /io/. On phonetic grounds, some items in the word list are written with /y/.

Stress on verbs occurs most frequently on the ultima, while stress on nouns occurs most frequently on the penult. Further study is required to discover additional patterns of stress.

## 47. Tolai

---

---

**Contributor:**

Introduction and Wordlist: *Ulrike Mosel*

---

---

### 1. Introduction

---

---

The language of the Tolai people is called *Kuanua* by the Tolai people themselves and the Methodist Church (Wright 1964), *Tolai* by linguists, and *Tuna* (Meyer 1961) or *Gunantuna* (Zwinge 1983) by Catholic missionaries. Other names are: *Blanche Bay dialect*, *New Britain dialect* (Rickard 1889), *Nordgazellen-Sprache* (Bley 1912), *Neu-Pommerische Sprache* (Constantini 1907), and *Raluana* (Lanyon-Orgill 1962).

The Tolai people, who number about 90,000, live in small villages near the town of Rabaul, East New Britain Province, Papua New Guinea. Though spoken in New Britain, Tolai is genetically more closely related to the languages of New Ireland than to those of New Britain. According to Ruhlen (1987: 349), it is classified as Patpatar-Tolai, New Ireland-Tolai, Oceanic, Eastern Malayo-Polynesian, Central Eastern Malayo-Polynesian, Malayo-Polynesian, Austronesian (compare Beaumont 1972: 12ff, Chowning 1969: 24). The Tolai language shows a large diversity of regional varieties which can be classified into three groups of dialects:

1. Kokopo dialects, including Papatava (Kleintitschen 1924) and Raluana.
2. The North Coast dialects, including Volavolo (Bley 1912) and Rakunai (Meier 1909, Mosel 1977).
3. Marginal dialects, including the dialects of Nodup, Kabair, Vuatom, and Vunamarita.

The present word list is mainly based on Meyer (1961), Wright (1964), and my own collections of data which I gathered during two and six months fieldwork in 1976 and 1978, respectively; however, this fieldwork did not include thorough phonological and lexical studies, but concentrated on syntax and socio-linguistics (Mosel 1980, 1984).<sup>1</sup>

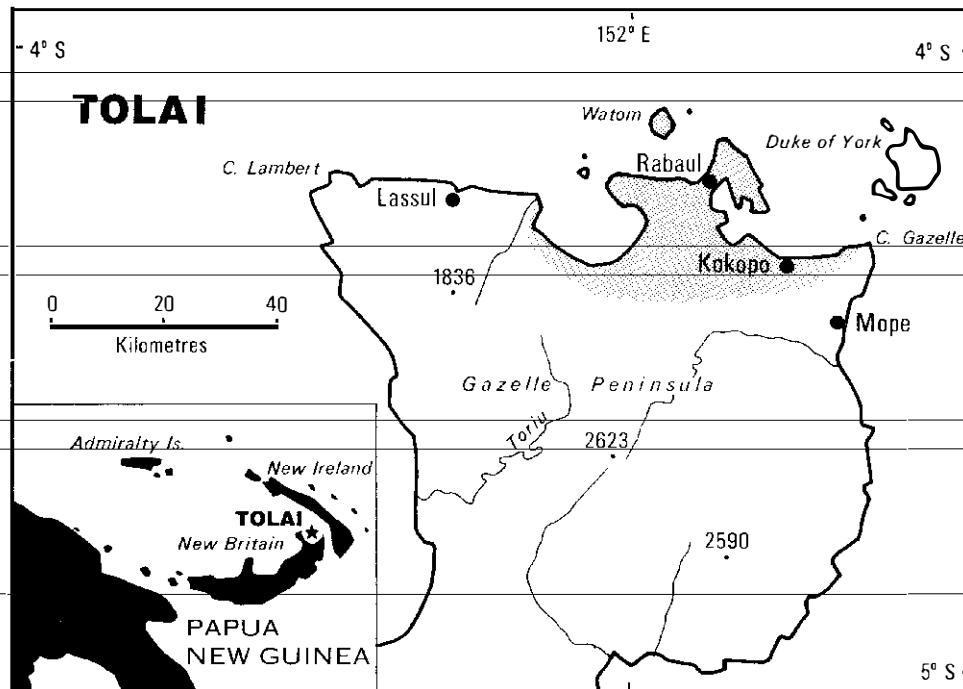

---

---

1. My research on Tolai was financed by the Deutsche Forschungsgemeinschaft (German Research Society) as part of the research projects "Linguistic Change and Language

---

---

Map 47. Tolai language area

## 2. Phonology

### 2.1 Word stress

Stress falls on the penultimate syllable of the word.

### 2.2 Inventory of consonants

		Labial	Apical	Dorsal
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>
	vd	<i>b</i>	<i>d</i>	<i>g</i>
Fricatives		<i>β</i>	( <i>s</i> )	
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>
Laterals			<i>l</i>	
Trills			<i>r</i>	

Mixing” in Munich and “Language Universals and Typology” (UNITYP) in Cologne from 1977-1979 and 1980-1984, respectively.

/β/ is a bilabial voiced fricative. /s/ only occurs in loanwords and alternates with /t/: *sitima*, *titima* ‘steamer’, *os*, *ot* ‘horse’. Voiced stops never occur in word final position. In the North Coast dialects the voiced stops are prenasalised.

### 2.3 Inventory of vowels

Tolai has a six vowel system. Vowel length is distinctive (Mosel 1980: 20).

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>	<i>ə ē</i>	<i>o ō</i>
Low		<i>a ā</i>	

Tolai does not have diphthongs. Sequences of different vowels constitute separate syllables.

### 2.4 Syllable structure

The syllables of Tolai have the following structures: V, VC, CV, CVC. Within the word, consonant clusters are only found at morpheme boundaries: *var-mari* ‘to love each other’ (*var* = REC, *mari* (trans) ‘to love s.o.’). In loanwords consonant clusters are split up (*pelet* ‘plate’, *Ingilit* ‘English’), or reduced by the omission of a consonant (*pen* ‘paint’).

## 48. Central Buang

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Bruce A. Hooley</i>
--

---

---

### 1. Introduction

---

---

Central Buang is an Austronesian language spoken in the central part of the Snake River Valley in the Mumeng sub-Province, Morobe Province, Papua New Guinea. The term Buang is not a local one, although it is generally accepted by the speakers. *Bu* is the Busama word for ‘water’ or ‘river’, and the *Ang* is a ‘stream which flows into the ocean’ on the coastal side of the range. It was along this stream that the Buangs used to travel to reach the coast if they ventured that far afield in the days before European contact. The other term used by coastal people for the Buangs was Kaidemoe, which sometimes appears in the literature as Gaidemoe. This was a somewhat derogatory term akin to “bush kanaka”.

The Buang language family is a close-knit group of four larger and two smaller languages ranging from Buasi on the coast to Piu in the middle Watut. There are three major groups in the Snake River valley, the headwaters, the central villages, and the Mangga Buang. These three parts correspond to linguistic divisions also, the first two being taken as dialects, and the third as a distinct language. For further details of the linguistic situation in the area see Hooley (1970).

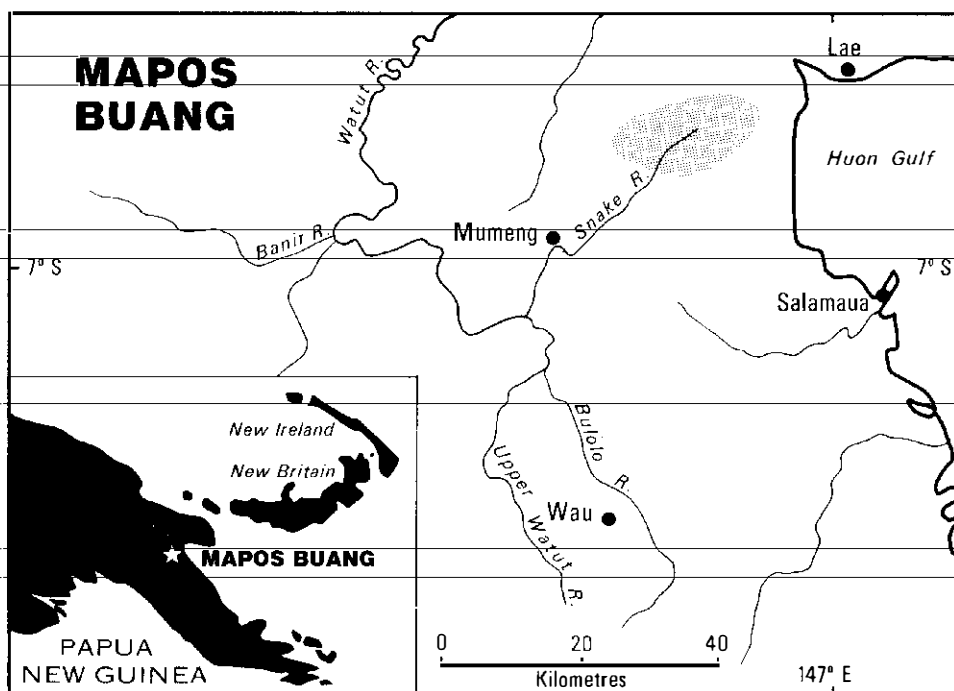

The data recorded in this wordlist are based principally on the speech of Mapos I and the nearby villages. Mapos I is one of the main Central Buang villages. Some of the other villages of this dialect show differences in speech, mostly in vocabulary items, although almost every village has some minor linguistic variations. Central Buang comprises ten villages: Wij (Davong), Römaröm (Lomalom), Humek (Bulantim), Mapos I, Mapos II, Sebulek (Chimbulok), Saggee (Senagai), Səhayo (Sagaiyo), Seyuggee (Siyuwai), and Pepeknë (Popekani). (Where the official government name for the villages differs from that normally used by the people, it is given in parentheses.)

Basically, the language varieties of Mapos I, Mapos II, Sebulek, Saggee, Seyuggee, Səhayo and Pepeknë are very similar. A more substantial difference can be seen between these villages and those of Humek, Römaröm

---

---

and Wij, with Wij being more divergent than the other two. While most of the distinctions observed in the speech of these villages are vocabulary items, there are some phonological features such as intonation patterns which are characteristic of particular villages.

Map 48. Central Buang language area

## 2. Sound system and orthography

Table 1. Consonants

		Bilabial	Dental- alveolar	Alvco- Palatal	Velar	Labio- Velar	Uvular
Stops	vl	<i>p</i>	<i>t</i>		<i>k</i>	<i>k<sup>w</sup></i>	<i>ḱ</i>
	vd	<i>b</i>	<i>d</i>		<i>g</i>	<i>g<sup>w</sup></i>	<i>ḡ</i>
Fricatives	vl			<i>s</i>			
	vd	<i>β</i>		<i>z</i>	<i>ɣ</i>		<i>ʁ</i>
Nasals		<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	<i>ŋ<sup>w</sup></i>	<i>ŋ̣</i>
Laterals			<i>l</i>				
Flaps			<i>r</i>				
Semi-vowels		<i>w</i>		<i>y</i>			

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>	<i>[ə]</i>	<i>o ō</i>
Low	<i>ε ē</i>	<i>a ā</i>	<i>ɔ ɔ̄</i>

Some of the problems encountered in setting up an orthography for Central Buang are discussed in Hooley (1974).

Prenasalisation of voiced stops is automatic, so the prenasalisation has not been written in the orthography or in this word list.

The contrast between the velar and uvular point of articulation is preserved in the present word list by writing a dot under uvular *k*, *g*, *ŋ* and *ŋ̣*. For reasons discussed in Hooley (1974) the contrast is not written in the normal orthography.

*/s/* and */z/* are sibilants which tend to affricate articulation. With some speakers in some environments */s/* is [tʃ]. The voiced sibilant */z/* is prenasalised.

Schwa is an open transition between consonants, and is not considered phonemic, but it is written in the wordlist for convenience.

The labio-velar voiced continuant *w* has a non-phonemic voiced fricative on-glide word medially.

### 3. Morphology

Buang shares a number of features of grammar with other Austronesian languages. No attempt is made here to give a full grammatical description of the language, but some of the more salient features which may be helpful follow.

#### 3.1 Noun classes

Nouns fall into two main categories in Buang, those which decline for possession, and those which do not. The former constitute a class called inalienable, and are for the most part body parts and kin terms. Within this group, there is a further subdivision based on the set of suffixes which are used to indicate person. There are some words which also show a change of vowel in the root. The other group, known as alienable, does not decline for possession, and includes everything which is not inalienable, such as houses,

clothing, food. The classification does not follow a strictly logical dichotomy as it might be seen through western cultural eyes, and should not be judged on that basis. For example *rur* 'breast' does not decline, whereas *ŋayi* 'many' does. The two sets of affixes are as follows:

1sg	-ŋ	-k
2sg	-m	-p
3sg	-Ø/-n	-z
1pl incl	-d	-sed
1pl excl	-min	-pin
2pl	-min	-pin
3pl	-z	-sez

The set on the left is the most common. Single syllable roots with an e in the third person singular change the vowel to ɔ in first and second person singular, in first person plural exclusive and second person plural. The free pronouns for second and third person singular and third person plural are not normally used. The following chart gives examples of the different types:

	'penis'	'father'	'face'	'tongue'
1sg	<i>sa lig</i>	<i>samag</i>	<i>samalag</i>	<i>sa dayɔg</i>
2sg	<i>lim</i>	<i>amam</i>	<i>malam</i>	<i>dayen</i>
3sg	<i>lin</i>	<i>ama</i>	<i>mala</i>	<i>dayen</i>
1pl incl	<i>ɣil lid</i>	<i>ɣil amad</i>	<i>ɣil malad</i>	<i>ɣil dayed</i>
1pl excl	<i>ɣɛ limin</i>	<i>ɣɛ amamin</i>	<i>ɣɛ malamin</i>	<i>ɣɛ dayemin</i>
2pl	<i>ɣam limin</i>	<i>ɣam amamin</i>	<i>ɣam malamin</i>	<i>ɣam dayemin</i>
3pl	<i>liz</i>	<i>amaz</i>	<i>malaz</i>	<i>dayez</i>

	'parent-in-law'	'home'	'tail'
1sg	<i>sa ɣɔg</i>	<i>sa bɔg</i>	<i>sa yuk</i>
2sg	<i>ɣɔm</i>	<i>ben</i>	<i>ɣus</i>
3sg	<i>ɣen</i>	<i>ben</i>	<i>ɣus</i>
1pl incl	<i>ɣil ɣed</i>	<i>ɣil bed</i>	<i>ɣil ɣused</i>
1pl excl	<i>ɣɛ ɣɔmin</i>	<i>ɣɛ bɔmin</i>	<i>ɣɛ ɣupin</i>
2pl	<i>ɣam ɣɔmin</i>	<i>ɣam bɔmin</i>	<i>ɣam ɣupin</i>
3pl	<i>ɣez</i>	<i>bez</i>	<i>ɣusez</i>

First person singular forms with vowel initial roots may occur with the free pronoun *sa*, or, more commonly, with the pronoun merged with the root.

In each case the third person singular form is listed in the word list.

The possessive of alienable possessions is formed as follows:

	'house'	'food'
1sg	<i>sa bəyaŋ</i>	<i>sa nos</i>
2sg	<i>yoŋ bəyaŋ</i>	<i>yoŋ nos</i>
3sg	<i>yi bəyaŋ</i>	<i>yi nos</i>
1pl incl	<i>ɣil bəyaŋ</i>	<i>ɣil nos</i>
1pl excl	<i>ɣe bəyaŋ</i>	<i>ɣe nos</i>
2pl	<i>ɣam bəyaŋ</i>	<i>ɣam nos</i>
3pl	<i>ɣir bəyaŋ</i>	<i>ɣir nos</i>

### 3.2 Verb classes

Buang uses something more akin to aspect than to traditional tense, and the verbs fall into three main classes based on how the aspect is indicated. With some verbs, aspect markers also change with person. There are two aspects, and the dichotomy is similar to that sometimes referred to as realis/irrealis, or perfective/imperfective. In general, the first usually refers to events which have taken place, are taking place, or are certain to take place; the second refers to events which have not taken place, or are hypothetical only. Potential therefore is similar to future tense and actual is often similar to past tense.

Verbs are listed in their actual form, and, where applicable, in the third person. Verbs stressed on the first syllable of the root have a prefix *a-* in the first person plural inclusive, provided the vowel in that syllable is not itself *a*. This prefix does not appear with first person plural exclusive with the free pronoun since that ends in a vowel. If a consonant final word (such as *rek*) occurs between the pronoun and the root however, then the *a-* appears with the exclusive forms also. For the first person singular forms of these same verbs the vowel of the free pronoun is lost, and the consonant is attached to the verb root with open transition. For example:

<i>sa kəβu</i>	'I write'	<i>səya</i>	'I eat'
<i>ɣil kəβu</i>	'we (excl) write'	<i>ɣe kəβu</i>	'we (excl) write'
<i>ɣil rek kəβu</i>	'we will write'	<i>ɣe rek kəβu</i>	'we will write'
<i>ɣil tayi</i>	'we call'	<i>ɣe tayi</i>	'we call'
<i>ɣil aɣ</i>	'we will eat'	<i>ɣe ɣa</i>	'we will eat'
<i>ɣil rek aɣa</i>	'we'll eat later'	<i>ɣe rek aɣa</i>	'we will eat later'

**Class 1**

Potential aspect is indicated by either  $\emptyset$ - or *na*-. For most verbs in this class there is no change. Aspect is deduced from context, or by the addition of an adverb of time, or by association with another verb which is marked. For verbs stressed on the first syllable, *na*- is prefixed to the actual form to yield the potential, otherwise it is  $\emptyset$ .

	<i>tayi</i> 'call' Actual/Potential	<i>puβin</i> 'crumble' Actual
1sg	<i>sa tayi</i>	<i>səpuβin</i>
2sg	<i>gətayi</i>	<i>gəpuβin</i>
3sg	<i>tayi</i>	<i>puβin</i>
1pl incl	<i>ɣil tayi</i>	<i>ɣil apuβin</i>
1pl excl	<i>ye tayi</i>	<i>ye puβin</i>
2pl	<i>ɣam tayi</i>	<i>ɣam puβin</i>
3pl	<i>dətayi</i>	<i>dəpuβin</i>
	<i>səsufin</i> 'suck' Actual/Potential	Potential
1sg	<i>sa səsufin</i>	<i>sa napufin</i>
2sg	<i>gesəsufin</i>	<i>gənapufin</i>
3sg	<i>səsufin</i>	<i>napufin</i>
1pl incl	<i>ɣil səsufin</i>	<i>ɣil napufin</i>
1pl excl	<i>ye səsufin</i>	<i>ye ɣapufin</i>
2pl	<i>ɣam səsufin</i>	<i>ɣam napufin</i>
3pl	<i>dəsəsufin</i>	<i>dənapufin</i>

Verb roots in this class which begin with *k*- or *g*-, with one or two exceptions, also decline for person, as for example:

	'get up'	'pierce, spear'
1st person	<i>kədi</i>	<i>gəlu</i> (i.e. 1st person and <i>k</i> and <i>g</i> )
2nd person	<i>k<sup>w</sup>ədi</i>	<i>g<sup>w</sup>əlu</i>
3rd person	<i>kədi</i>	<i>gəlu</i>

**Class 2**

Verbs in this class are marked by a prefix in both actual and potential. The prefix declines for person.

	Actual	Potential
1st person	<i>ya-/y-</i>	<i>ga-/g-</i>
2nd person	<i>∅-</i>	<i>g<sup>w</sup>-</i>
3rd person	<i>∅-</i>	<i>g-</i>

Verbs in this class are all single syllable roots. The prefixes *ya-/y-* and *ga-/g-* occur with only three common verbs:

<i>le</i>	'see'
<i>ŋo</i>	'hear'
<i>ko</i>	'take/bring'

The following illustrates this class of verb:

	<i>tup</i> 'run' Actual	<i>le</i> 'see' Actual
1sg	<i>sa yətup</i>	<i>sa yale</i>
2sg	<i>gətup</i>	<i>gəle</i>
3sg	<i>tup</i>	<i>le</i>
1pl incl	<i>yil yətup</i>	<i>yil yale</i>
1pl excl	<i>ye yətup</i>	<i>ye yale</i>
2pl	<i>yam tup</i>	<i>yamle</i>
3pl	<i>dətup</i>	<i>dəle</i>

	Potential	Potential
1sg	<i>sa gətup</i>	<i>sa gale</i>
2sg	<i>g<sup>w</sup>ətup</i>	<i>g<sup>w</sup>əle</i>
3sg	<i>gətup</i>	<i>gəle</i>
1pl incl	<i>yil gətup</i>	<i>yil gale</i>
1pl excl	<i>ye gətup</i>	<i>ye gale</i>
2pl	<i>yam g<sup>w</sup>ətup</i>	<i>yam g<sup>w</sup>əle</i>
3pl	<i>dəgətup</i>	<i>dəgəle</i>

### Class 3

Except for a very few exceptions this class could have been united with Class 1, but because of these exceptions it is deemed easier to mark them as a separate class. The potential aspect of these verbs is formed by changing the initial consonant of the root as follows:

Actual	Potential
$\beta$ -	$b$ -
$l$ -	$d$ -
$\gamma$ -	$g$ -
$s$ -	$\eta$
$r$ -	$z$ -
$y$ -	$n$ -
$y$ -	$\eta$
$y$ -	$z$ -

Some correspondences are less common than others, for example, the correspondence  $y/z$ - has only been noted with one verb.

Those verbs in this class whose roots begin with  $\gamma$ - change for person just as with the verbs in Class 2. There is a further difference in second person if the verb has a back rounded vowel in the first syllable. This may be seen in the following examples:

	Actual	Potential	Actual	Potential
	$\gamma ep$ 'sleep/lie'		$\gamma urək$ 'go upstream'	
1sg	$sə\gamma ep$	$sə\eta ep$	$sə\gamma urək$	$sə\eta urək$
2sg	$gəwep$	$gəg^wep$	$gə\gamma urək$	$gə\eta urək$
3sg	$\gamma ep$	$g ep$	$\gamma urək$	$g urək$
1pl incl	$\gamma il a\gamma ep$	$\gamma il a\eta ep$	$\gamma il a\gamma urək$	$\gamma il a\eta urək$
1pl excl	$\gamma e \gamma ep$	$\gamma e g ep$	$\gamma e \gamma urək$	$\gamma e \eta urək$
2pl	$\gamma am wep$	$\gamma am g^wep$	$\gamma am \gamma urək$	$\gamma am \eta urək$
3pl	$də\gamma ep$	$də\eta ep$	$də\gamma urək$	$də\eta urək$

Other examples of Class 3 verbs are:

	$\beta əya$ 'flee'	$ya$ 'go'	$sis$ 'hit'
	Actual	Actual	Actual
1sg	$sa \beta əya$	$səya$	$səsis$
2sg	$gə\beta əya$	$gəya$	$gəsis$
3sg	$\beta əya$	$ya$	$sis$
1pl incl	$\gamma il \beta əya$	$\gamma il aya$	$\gamma il asis$
1pl excl	$\gamma e \beta əya$	$\gamma e ya$	$\gamma e sis$
2pl	$\gamma am \beta əya$	$\gamma am ya$	$\gamma am sis$
3pl	$də\beta əya$	$dəya$	$dəsis$

	Potential	Potential	Potential
1sg	<i>sa bəya</i>	<i>səna</i>	<i>səŋis</i>
2sg	<i>gəbəya</i>	<i>gəna</i>	<i>gəŋis</i>
3sg	<i>bəya</i>	<i>ya</i>	<i>ŋis</i>
1pl incl	<i>ɣil bəya</i>	<i>ɣil ana</i>	<i>ɣil aŋis</i>
1pl excl	<i>ye bəya</i>	<i>ye na</i>	<i>ye ŋis</i>
2pl	<i>ɣam bəya</i>	<i>ɣamna</i>	<i>ɣam ŋis</i>
3pl	<i>dəbəya</i>	<i>dəna</i>	<i>dəŋis</i>

### Continuative mode

There is a continuative prefix *n-* to indicate actions which are in process or which go on for some time. There is the normal open transition between this and the verb root, so that it is written *nɛ-*. For verbs with the first person plural marker *a-*, it combines to give the prefix *na-*. For a few verbs this causes this form to fall together with the potential form. With Class 3 verbs of motion, the *na-* appears in the first person singular also.

<i>səβuβ</i>	‘I cut’	<i>sa nəβuβ</i>	‘I was cutting’
<i>sa kəlugin</i>	‘I pounded’	<i>sa nəkəlugin</i>	‘I was pounding’
<i>ɣil aya</i>	‘we ate’	<i>ɣil naya</i>	‘we eat/were eating’
<i>səyaɣ</i>	‘I went back’	<i>sənaɣaɣ</i>	‘I’m going back’

Continual, repeated, or habitual actions may be described using a verb phrase consisting of one of the verbs of position: sit, lie, stand, plus the continuative prefix and the verb. The verb ‘sit’ is used most commonly, and occurs in its potential form *medo*. The other two are used in the actual form. For example:

<i>mədo nəβoŋ</i>	‘he kept on doing it’
<i>βare nəle</i>	‘he stood there watching’
<i>ɣep nətək</i>	‘it lay open’

In Mapos and the neighbouring villages, but not in Humek and Römaröm, the continuative *n-* (and other nasals also) is often lost in normal speech, with accompanying lengthening of the vowel. In the case of the open transition, it is built up to full vowel status.

<i>ɣepetək</i>	‘it lay open’ (from <i>ɣep nətək</i> )
<i>dēle</i>	‘they were looking’ (from <i>denele</i> )

### 1. Introduction

---

The Adzera language is spoken by approximately 20,650 people living in the valley of the Markham River, and in the valleys of its tributaries to the north and south, in Morobe Province, Papua New Guinea. Within Adzera there are several different varieties spoken. These are:

1. Central dialect chain, comprising 23 villages in the central part of the Markham Valley. This variety includes the villages of the Onga? group, on the south bank of the Markham River, and has approximately 9,950 speakers.
2. Amari dialect, spoken in 14 villages from the Umi River to the Markham-Ramu Divide, with 5,300 speakers.
3. Ngarowapum dialect, spoken in four villages on the northern side of the Markham Valley between Umi and Mangiang Rivers, with 1,200 speakers.
4. Yarus dialect, which is found in ten villages in the mountains to the north of Ngarowapum, and in the valleys of the Mangiang, Mami and Yafats Rivers. These people number 2,200.
5. Guruf dialect, spoken in six villages on the south side of the Markham River, between the Waffa River and the village of Idzingants. This dialect also includes Ngariawang village, which is several kilometres up into the Leron River valley, on the opposite side of the Markham Valley to Guruf. Total population is 1,550.
6. Tsumanggorun village, which has its own variety of Adzera. This village is on the northern side of the Markham Valley, near the Iroap River. Its population is 400.

Previous work has been done on Adzera by K.G. Holzknacht (n.d., 1973a, 1973b, 1973c), Hooley (1971, 1976) and S.C. Holzknacht (1986, 1989).

---

---

The research on which the present wordlist is based was carried out between 1976 and 1987. This has been supplemented by data from K.G. Holzknacht's unpublished dictionary of Adzera (K.G. Holzknacht, n.d.).

## 2. Phonology

The phonology of Adzera is summarised below.

### 2.1 Consonants

Adzera has 24 consonant phonemes.

		Labial	Alveolar	Palatal	Velar	Glottal
<u>Stops</u>	vl	<i>p</i>	<i>t</i>		<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>		<i>g</i>	
pre-nasal.	vl	<i><sup>m</sup>p</i>	<i><sup>n</sup>t</i>		<i><sup>ŋ</sup>k</i>	<i>ʔʔ</i>
<u>Affricated</u>	vl		<i>tʃ</i>			
	vā		<i>tʃ̄</i>			
	pre-nasal.	vl	<i><sup>n</sup>tʃ</i>			
	vd		<i><sup>n</sup>dʒ</i>			
Fricatives		<i>f</i>	<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>		<i>ŋ</i>	
Flaps			<i>r</i>			
Semivowels		<i>w</i>		<i>y</i>		

### 2.2 Vowels

Adzera has four vowels in most dialects:

*a i o u*

Amari and Ngarowapum dialects have three vowels:

*a i u*

### 2.3 Diphthongs

Adzera has the following diphthongs:

*ai au ia ua ui oi* (in dialects with *o*)

## 2.4 Discussion

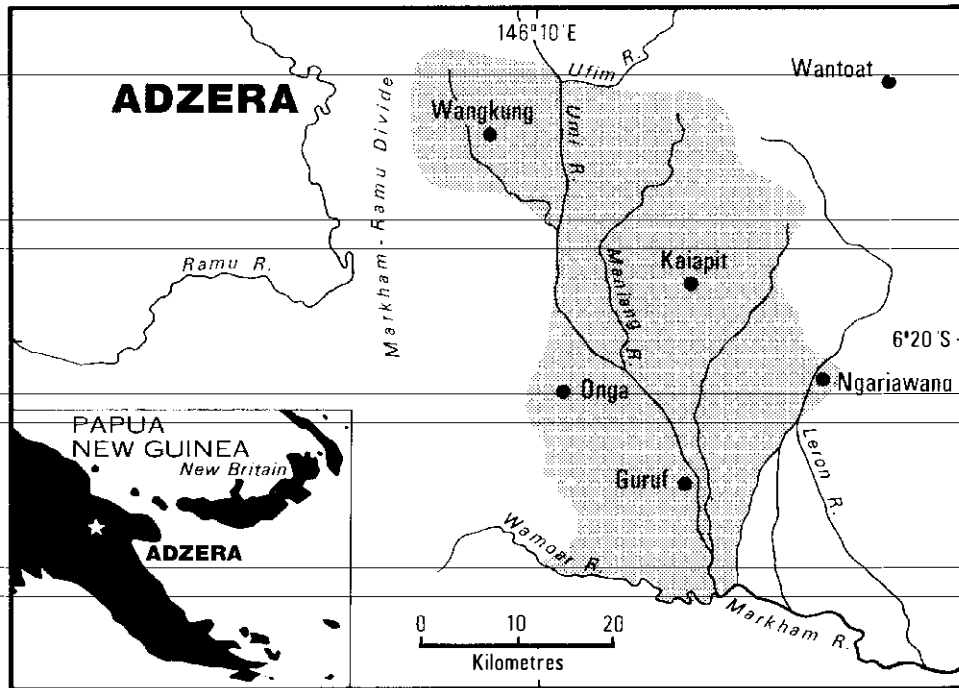

1. The prenasalised consonants /<sup>n</sup>m p, <sup>n</sup>t, <sup>n</sup>k, <sup>n</sup>ʃ, <sup>n</sup>dʒ/ occur in all positions, but when they occur word-initially the nasal feature is not realised unless it is preceded by a vowel.

e.g. <sup>n</sup>ʃim 'betel-nut'  
 [warim ʃim ba] 'Give me the betel-nut'

cf. [u <sup>n</sup>ʃim am] 'Your betel-nut'

/<sup>n</sup>ʔ/ occurs medially and word-finally only.

2. /h/ is recorded in one word only, *hai?* 'yes'.
3. /r/ is a flapped liquid [ɾ].

Map 49. Adzera language area

## 3. Morphophonemics

There are several morphophonemic features of Adzera which are important for interpreting the wordlist.

### 3.1 Participle-marking suffix $-(d)a(n)$

There are two rules which apply to the use of the participle-marking suffix  $-(d)a(n)$ .

- a. When the verb root ends in a consonant, the form of the suffix is either  $-an$  or  $-a$ . When the verb root ends in a vowel, the form of the suffix is either  $-da$  or  $-dan$ .
- b. When it occurs at the end of a sentence, the form of the suffix is either  $-an$  or  $-dan$ . When the following sound is a vowel, the form is also either  $-an$  or  $-dan$ . When the following sound is a consonant, the form is either  $-a$  or  $-dā$ .

### 3.2 Possessive pronoun suffixes

All nouns in Adzera are possessed either alienably or inalienably.

- a. Alienable nouns take a set of possessive pronoun suffixes of the form  $-(g)a^{ʔʔ}$  1st person,  $-(g)am$  2nd person,  $-(g)an$  3rd person. If the noun root ends in a vowel, the form is  $-ga^{ʔʔ}$ ,  $-gam$  or  $-gan$ . If the noun root ends in a consonant, the suffix form is  $-a^{ʔʔ}$ ,  $-am$  or  $-an$ .

e.g. *gum-a<sup>ʔʔ</sup>* ‘my garden’     *nowai-gan*     ‘his mango’

- b. Inalienable nouns, which include all kin terms and body parts, take two possessive suffixes, the first of which is obligatory and the second is optional. The suffixes are  $-^{ʔʔ}-(ga^{ʔʔ})$  1st person,  $-m-(gam)$  2nd person, and  $-n-(gan)$  3rd person.

e.g. *rina-* ‘mother’  
*rina-<sup>ʔʔ</sup>-(ga<sup>ʔʔ</sup>)* 1st person  
*rina-m-(gam)* 2nd person  
*rina-n-(gan)* 3rd person

In 2nd and 3rd persons,  $-m$ ,  $-n > \eta/-g$ .

### 3.3 Obligatory object marker *gin*

Many Adzera verbs take *gin* as an obligatory marker before direct objects. This is a reflex of Proto-Oceanic *\*akini* (prepositional verb), and in Adzera the form combines the prepositional functions of instrument, purpose, causal with an incorporated 3rd person pronoun object.

If the preceding word ends in a consonant, the form of the marker is *in*. If the preceding word ends in a vowel, the form is *gin*. If the object is other than a 3rd person pronoun, the form used is *i + noun/pronoun object*.

- e.g. *dzi-i-riŋa<sup>n</sup>tin* 'I hear (it)'  
*wa-ni gin* 'Tell about it'  
*dzi-i-riŋa<sup>n</sup>ti nani ago* 'I heard some talk about you'

## 50. Kilivila

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Ralph Lawton</i>
--

---

---

### 1. Introduction

---

---

The Kilivila language is spoken by about 20,000 people, 16,000 of whom live on the northern fringe of the Milne Bay Province in Papua New Guinea. The majority live in the Trobriand Islands group, some 12,000 on the main island of Kiriwina, and 2,500 on the other islands of the group. Other Kilivila-speaking people are resident in the Marshall Bennett Islands, with two small Kilivila-speaking communities in Yanabwa (northern edge of Egum Atoll) and in the Lusancay Islands. The rest of the Kilivila-speaking population are to be found in the major cities and towns of Papua New Guinea, where they work in Government or commercial employment.

There are a number of different dialects of Kilivila, characterised mainly by regional phonological variants, with some morphological changes. The five dialects spoken on the main island of Kiriwina are Kilivila (from which the modern name of the language is taken) (North Kiriwina Island, 5,200 speakers), Kuboma (Central Western Kiriwina Island, 1,700 speakers), Luba (Central Eastern Kiriwina Island, 3,100 speakers), Kavataria (Central Kiriwina Island, 1,200 speakers), and Kaibwagina (South Kiriwina Island, 800 speakers). See map for dialect distribution.

When the Methodist Church commenced work in the Trobriand Islands, its headquarters was established in 1894 in the central area where the Kavataria dialect is spoken. Later, in about 1908 the Government was based in the same area. Thus it has been the Kavataria dialect which has been used for most literature, vernacular education and governmental circulars and legal communication. This statement and wordlist is set in that dialect.

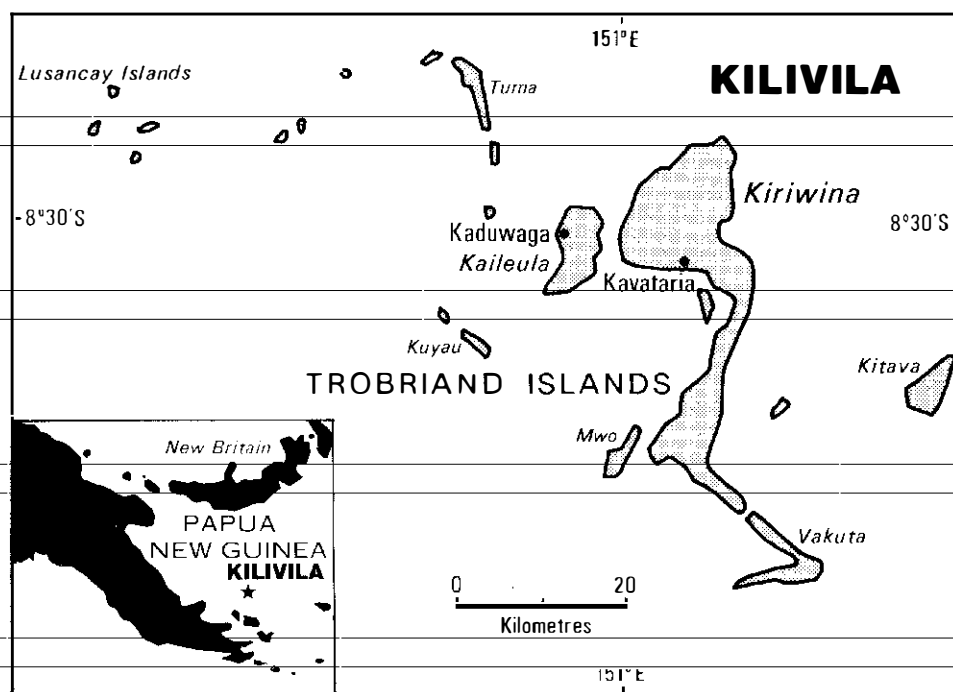

Although the number of speakers of the Kavataria dialect is small, it has acquired status in Kiriwina as the acceptable medium for any literary work in Kilivila. In 1970-1972 there was an attempt to change to the numerically superior and politically dominant Kilivila dialect, an attempt with which I co-operated, believing the reasons for the change to be worth adequate testing. However I left the final decision to the Kilivila people, and the final vote, in which a good proportion of Kilivila dialect speakers participated,

---

---

unanimously opposed such a change. It seems that the Kilivila dialect speakers were happy to condescend to a continuation of Kavataria dialect for literary purposes, while the speakers of all other dialects felt comfortable with the status quo and would have felt threatened by a change to the dialect of the dominant group.

My residence in the Trobriand Islands was for a period of eleven years, a major interest in this time being the study of the Kilivila language as far as my duties as a minister of the Methodist (later the United) Church permitted. I had and have many friends who came to understand and appreciate my desire to learn and my efforts for authentic situations, and this frequently resulted in linguistically sophisticated comments from informants desiring to correct what they had considered errors made by previous students of the language. Amongst all of them my most treasured friend was, and still is, Antonio Lubisa Bunaimata, and I record my indebtedness to him here.

Map 50. Kilivila language area

## 2. The phoneme inventory

The phoneme inventory of the Kilivila language includes 19 consonants, five vowels and six diphthongs, viz. *p, b, t, d, k, g, m, n, p<sup>w</sup>, b<sup>w</sup>, k<sup>w</sup>, g<sup>w</sup>, m<sup>w</sup>, r, s, β, l, w, y; i, u, e, o, a; ai, au, ei, eu, oi, ou*. Also stress may have phonemic status. These phonemes are tabulated below.

consonants /r/, /l/ and /n/, part of which is free and part is conditioned by current language change; and the relaxed or lenis quality of the bilabial fricative /β/ so that it is frequently lost when occurring in word medial positions.

/m/	<i>-mto-mota</i>		
	continuous-hiccup ‘speak with an impediment’ (see text example 04.960)		
fluctuation	<i>kainawari</i> (or)	<i>kainawali</i> (or)	<i>-kailawali</i>
	‘root’	/r/ to /l/	/n/ to /l/
	(see text example 08.540)		
/β/ to /θ/	<i>-kaβikaβila</i> to	<i>-kaikaila</i>	
	(vb) ‘to flash (lightning)’	‘to flash (lightning)’	

The lax quality of /β/ is a factor which causes it to be wrongly heard and recorded as /w/ by students of the language.<sup>1</sup>

The phoneme /k/ has two major allophonic forms –

[k̠]	(voiceless back velar) when followed by /a/, and
[k]	(voiceless velar) elsewhere. <sup>2</sup>

See below for the phonotactic phenomena arising from this.

The syllable pattern may be expressed formally as

$$\{ (C) V (m) \}$$

iii

where (C) may be optionally filled by any consonant, V must be any vowel from the above inventory, and (m) may be optionally filled by the consonant /m/ which alone may form a closed syllable; alternatively (C) V (m) must be replaced by /m/ when it functions as the syllabic nasal.

1. See for example Malinowski (1935: 100) the list for names of /kuβi/ yams includes some as /k<sup>w</sup>i-/ and some as /kuβi-/. This volume has splendid natural text but abounds in many similar errors.
2. The Adjective /βeka/ has often been misheard by linguists because of a phonemically non-significant vowel which appears as the syllable /βe/ is assimilating to the point of articulation of the back velar in /ka/, so that phonetically it is heard as [βeaka]. Old Kiriwian literature has spelt this morpheme as /-βeaka/ (Fellows 1901) or /-βiyaka/ (Malinowski). I followed the old way until a village man, not one of my regular informants, pointed out the error, carefully and slowly enunciating each syllable as /βe/.../ka/. His insight into his own language is borne out by the reduplicative form -βaka-βeka (which Malinowski laboriously spells out as /βa-kay-βiyaka/).

<i>o-kum.kum.la</i>	<i>-m.li.li</i>
V.CVm.CVm.CV	m.CV.CV
'in-oven'	'(adv) clearly'

### 3. Phonotactics

No limitations occur on the syllable sequences that occur across word boundaries. There are however some co-occurrence restrictions within the syllable, between syllables, and some features of the phonological word.

The labialised or rounded consonants do not occur in syllables with a rounded vowel nucleus, a feature they share with the consonant /β/. The semivowels cannot be followed by the high close vowel nearest to them in their manner of articulation, and this feature they share with the consonant /m/.

/p <sup>w</sup> ap <sup>w</sup> asa/	/b <sup>w</sup> ib <sup>w</sup> i/	/-βeilau/
'easy'	'dangling shell ornament'	'to steal'
(* /p <sup>w</sup> o/, * /b <sup>w</sup> u/ or * /βo/ forms do not occur.)		

/wi!/ (Form \*/wu/ does not occur.)  
'Ugh!' (disgust)

/yuβiyaβi/ (Form \*/yi/ does not occur.)  
(adj) 'hot'

/-mto-mota/ (Form \*/-mutomota/ does not occur.)  
'speaking unintelligibly'

The nucleus of the closed syllable CVm may be filled by any pure vowel or the diphthongs /ai/ or /ei/.

No words occur with more than two closed syllables, and only one occurrence of the syllabic /m/ per word is the general, almost universal, pattern. Where vowel clusters occur, as they do frequently with permissible CV.V or V.V syllables, pure vowels cluster frequently, diphthongs more rarely. Within the diphthongs a comparatively high frequency of clustering occurs due to a regular phenomenon or morphophonemic juncturing between verb stems and affixes.

<i>-uu</i>	<i>ei-uu</i>
'wind blows'	'it has-blown (wind)'
<i>-luluwai</i>	<i>bi-luluwai-aigu</i>
'remember'	'he will-remember-me'
	<i>la-luluwai-aim</i>
	'I have-remembered-you (sg)'

A phonotactic feature of the voiceless back velar has to be stated. When the syllable /ka/ is preceded by /u/ or /m/ it becomes /k<sup>w</sup>a/. This is stated in the rule:

$$ka \rightarrow k^w a / \left\{ \begin{array}{c} u \\ m \end{array} \right\} -$$

which has no exception. When this is combined with the feature of syllable loss noted above, that is, when the /kwa/ syllable is preceded by a /ku-/ syllable, the result is that the /kwa/ form remains even though the /ku-/ which caused it to occur is no longer present. Thus:

<i>to-karaiwaga</i>	→	* <i>to-ku-k<sup>w</sup>araiwag</i>	→	<i>tok<sup>w</sup>araiwaga</i>
‘person-rule’		‘person-contin.-rule’		‘judge, governor’
‘the one who gave a ruling’				

<i>to-kabilia</i>	→	* <i>to-ku-k<sup>w</sup>abilia</i>	→	<i>tok<sup>w</sup>abilia</i>
‘person-fight’		‘person-continuous-fight’		‘soldiers, army’
‘a soldier’				

<i>-kau</i>	→	<i>ku-k<sup>w</sup>au</i> (which also occurs as)	<i>k<sup>w</sup>au</i> <sup>1</sup>
vb ‘take’		‘you-take’	‘you-take’

See wordlist examples 19.360 and 19.410 where this distinction occurs.

#### 4. The phonological word

The word in Kilivila consists of a group of one or more syllables one of which is given a certain prominence over the others. This prominence or stress is what makes a word isolable from others, as each phonological word has only one syllable with major stress.

Regular stress is on the penultimate syllable, with two exceptions. The first exception is where the final syllable is either closed or has a diphthong nucleus, when stress is on the final syllable.

1. Malinowski frequently and correctly included occurrences of this in his text examples. See again in *Coral gardens*, vol.2 text example 96.xxiv – /bu-k<sup>w</sup>aydodige/, in my orthography /bu-k<sup>w</sup>aidodiga/ which is originally /buku-k<sup>w</sup>aidodiga/ with loss of syllable /ku-/; also text example 92.iv (p.197) – /k<sup>w</sup>au vaygu´a/, in my orthography /k<sup>w</sup>au vaiguwa/ where the verb is originally /ku-k<sup>w</sup>au/ with loss of syllable /ku-/.

Penultimate stress

Final stress

*i-luluwai-'aigu**i-lulu'wai*

'he-remembers-me'

'he-remembers'

*i-kam-'koni**i-kam-'kwam*

'he-eat-try'

'he-continuous-eat'

'he tastes'

'he is having a meal'

The second exception places stress on the antepenultimate syllable when no morpheme boundary occurs within the last three syllables, and where the last two syllables conform to the pattern CV.(C)a with the provision that if V = /a/ then the two syllables must be:

$$ka \left\{ \begin{array}{l} \text{ } \\ \text{n} \end{array} \right. a$$

otherwise V = /i/ or /u/. Examples are:

where penultimate syllable nucleus is /a/

Antepenultimate stress

Penultimate stress

*ma'rakana**maka'wa-la*

'red (dye)'

'thus-it'

*'pakala**pa'ka-la*

'dry (throat)'

'feast-his'

where penultimate syllable nucleus is /i/ or /u/

Antepenultimate stress

Penultimate stress

*-'bukula**bu-'ku-la*

'bear fruit in clusters'

'incomplete-you go'

'you will go'

In all these three stress rules emphatic speech may move the stress back one syllable in the case of penultimate or word final stress, or forward to the penultimate in the case of antepenultimate stress.

#### 4. Two final comments

Two final comments need to be made in this brief statement, one in reference to the noun phrase, and the second in reference to the verb word.

The noun phrase is dominated by the semantic classifiers which Malinowski first reported in his 1920 paper. They are a single closed class of

morphemes which form the core of all deictics, and the stem to which all numerals under 100, and also many adjectives, are suffixed. They do not classify in any formal sense (except that their obligatory presence or absence in the adjectives makes a convenient formal feature to divide the adjectives into word classes), but it is necessary to be aware of the semantic groupings into which the Kilivila world view places things or activities in order to enter into any linguistic act of description.

*k<sup>w</sup>ai-yu*    *βaβagi*    *ma-k<sup>w</sup>ai-si-na*  
 thing-two    thing    that-thing-plural  
 ‘those two things (indeterminate shape)’

*ya-tolu*                      *βaβagi*    *mi-ya-si-na*    *ya-βaka-βeka*  
 thin/flexible-three    thing    that-thin-plural    thin-plural-big  
 ‘those three big thin-flexible things’

The verb word is morphologically very complex. There are three verb classes. Class 1 verbs are intransitive, and class 3 verbs are transitive. By far the biggest class is class 2 verbs, which have an obligatory marking either for verb focus or object focus.

Verb focus forms indicate that the speaker has the action of the verb as the main focus of attention in his comment; while the object focus form directs the attention of hearers to the object or goal to which the action of the verb is directed. Verb focus forms need not have an object, but occasionally do. The formal possibility of an object being present removes this verb from the group of true intransitives.

The two different forms of focus are expressed in most cases by a change in the vowels of the verb root. The rules governing such changes are too extensive to be quoted here, as different sorts of changes occur in disyllabic and trisyllabic verb roots. There is also a group which has the same simple verb stem for both verb and object focus forms, but which displays a distinctive formal change for focus in the reduplicative patterns only.

vb focus		obj.focus	
<i>i-lega</i>	<i>i-liga-lega</i>	<i>i-lagi</i>	<i>i-li-lagi</i>
‘he-listens’	‘he-listening’	‘he-hears (it)’	‘he-hearing (it)’
<i>i-sakaula</i>	‘he-runs’	<i>i-sakawoli</i>	‘he-runs (it)’
<i>kokola</i>	‘be fearful’	<i>-kukoli</i>	‘be frightened of’
<i>-tag<sup>w</sup>ala</i>	‘agree’	<i>-tug<sup>w</sup>ali</i>	‘agree to s.th.’
<i>-takumdu</i>	‘grimace’	<i>-takumdi</i>	‘make a face at’
<i>-βalulu</i>	‘give birth’	<i>-βilulu</i>	‘bear (someone)’

Words which show different form only in reduplicative patterns:

Basic root (vb and obj.f)	Reduplicated vb focus form	Reduplicated obj focus form	Gloss
-kuli	-kulikuli	-kukuli	'chew-suck (sugarcane)'
-b <sup>w</sup> eisi	-b <sup>w</sup> ab <sup>w</sup> eisi	-bub <sup>w</sup> eisi	'urinate'
-gabu	-gubugabu	-gigabu	'bum'
-sapi	-sipisapi	-sisapi	'brush off'

The distinction between verb focus and object focus forms has been made for numerous forms quoted in the wordlist.

### Bibliography

There is no complete grammar or dictionary of the Kiriwina language. Some partial works include:

# 51. Tawala

---

---

<b>Contributors</b>
---------------------

Introduction and Wordlist: <i>Bryan Ezard – Yailo Robert</i>
--

---

---

## 1. Introduction

---

Tawala is the easternmost language of the island of New Guinea and is also the easternmost language of the Taupota family (Lithgow 1976, Ross 1988). It is spoken along the north coast of the East Cape peninsula as far as Awaiama, most of the northern and southern shores of Milne Bay and also most of the islands of Sideia and Basilaki. Because of its unusual distribution, linguists were slow to recognise the extent of the language and presented dialectal data as apparently from a number of different languages, with orthographical discrepancies compounding the problem. The major dialects of Tawala are:

- Awaiama – Awalama
- Khelala – Keherara, East Cape
- Bohilai – Bohira'i, Basilaki
- Tawala – Tavara

The first intimation in the west of the Tawala language was contained in the 1889-1890 Annual Report of British New Guinea, when W. MacGregor presented a 650 item "Aboriginal vocabulary of Awaiama". It would be almost a century before the full extent of the Tawala language would become known, when, for the first time, Lithgow (1976) contained an accurate map of Tawala and related languages.

Tawala has never been the subject of a published monograph, but has figured in a small way in the work of Ray (ed. 1907; 1938), Capell (1943) and Ross (1988). Four published papers (Ezard 1978b, 1979, 1982 and 1992) use Tawala as the primary source of data. King (1901) contains a grammatical outline and small dictionary of Wedau, the westernmost member of the Taupota family. A reference grammar of Tawala (Ezard 1990) has recently been completed.

Of the two contributors, Ezard lived within the Tawala area and/or worked on Tawala almost continuously from 1974 to 1990. It was his practice to check materials for publishing with Robert, a speaker of the

---

---

Diwinai dialect (though he has had extensive experience communicating in all dialects). Robert made a number of changes from Ezard's suggested first draft, but Ezard accepts responsibility for any mistakes.

Map 51. Tawala language area.

## 2. Phonology

### 2.1 Stress

Stress normally falls on the penultimate syllable. However, when the penultimate syllable is a high vowel preceded by another vowel, stress moves to the antepenultimate syllable.

### 2.2 Consonants

There are 15 consonants in the present-day Diwinai dialect, though historically there were only 14, with *s* an allophone of *t*. The labio-velar consonants are quite rare, occurring in relatively few lexical items and no grammatical morphemes.

Table 1. Tawala consonants

		Labial	Alveo-dental	Velar	Labio-velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>	
	vd	<i>b</i>	<i>d</i>	<i>g</i>	<i>g<sup>w</sup></i>	
Fricatives			<i>s</i>			<i>h</i>
Nasals		<i>m</i>	<i>n</i>			
Laterals			<i>l</i>			
Semivowels		<i>w</i>	<i>y</i>			

Khelala and Bohilai dialects have three additional labialised consonants – *p<sup>w</sup>*, *b<sup>w</sup>*, *m<sup>w</sup>*, e.g. *gim<sup>w</sup>ala* (Diwinai *gimala*) ‘to trade’. The Labe dialect has a glottal stop (ʔ) not found in other dialects. Historically it occurred at morpheme breaks, but some of the resultant words are no longer actively derived, e.g. *tu<sup>ʔ</sup>awa-na* (Diwinai *tunawa-na* ‘by himself’). There are no consonant clusters, except where a syllabic [ŋ] is followed by another consonant, e.g. *kamna-na* ‘his disposition/health’.

### 2.3 Vowels

Tawala has the five vowel system common in Western Melanesia.

Table 2. Tawala vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

There are no diphthongs in Tawala. Each vowel forms the nucleus of a separate syllable.

### 2.4 Syllable structure

The syllable in Tawala consists of an optional consonant onset followed by a vowel nucleus – (C)V. The only exception to this rule is the syllabic [ŋ] (historically *mu*), e.g. *dimdim* ‘white-person’. The syllabic [ŋ] never occurs word initially.

### 3. Summary of morphology

#### 3.1 Pronouns

In Tawala, personal reference includes not only free forms but verb morphology, possessive clitics and marking on bound nouns, adjectives and post-nominal relators.

A possessive construction is used to express dual and trial (etc.) meaning: a numeral follows the appropriate (plural) possessive pronoun – *hai luwaga* ‘the two of them’, *ata tonuga* ‘the three of us (inclusive)’ etc. – and functions either in addition to or in place of an emphatic pronoun.

##### 3.1.1 Pronoun forms

Table 1 sets out the forms of all five classes of pronominal forms. There is considerable overlap between the various classes.

*Table 3. Pronominal forms (simplified) compared*

Pronoun class	1sg	2sg	3sg	1pl incl	1pl excl	2pl	3pl
Emphatic pronoun	<i>tau</i>	<i>tam</i>	<i>tauna</i>	<i>tauta</i>	<i>tauyai</i>	<i>taumi</i>	<i>tauhi</i>
Subject prefix	<i>a-</i>	<i>u-</i>	<i>i-</i>	<i>ta-</i>	<i>to-</i>	<i>o-</i>	<i>hi-</i>
Object enclitic	<i>-u</i>	<i>-m</i>	<i>-ni/-ya</i>	<i>-ta</i>	<i>-yai</i>	<i>-mi</i>	<i>-hi</i>
Possessive pron.	<i>u</i>	<i>om</i>	<i>a</i>	<i>ata</i>	<i>i</i>	<i>omi</i>	<i>hai</i>
Pronominal suffix	<i>-u</i>	<i>-m</i>	<i>-na</i>	<i>-ta</i>	<i>-yai</i>	<i>-mi</i>	<i>-hi</i>

Ross (1988: 279) observes that the emphatic pronouns are “based on a reflex of the noun POC *\*tau* ‘body, person’...with a pronominal possessive suffix”. The historical meaning of the noun is lost in present-day Tawala.

##### 3.1.2 Pronoun functions

There are seven distinctive functions assigned to pronouns. All pronouns are in bold in examples accompanying this section.

1. Emphatic pronoun – stressed free-form pronoun having an emphatic or contrastive function as either subject or object NP. Emphatic pronouns are used for human referents; demonstratives are used for non-humans as well as humans.

- |     |                                  |                         |
|-----|----------------------------------|-------------------------|
| (1) | <i>tauna i-na-yabiyabi.</i>      | <i>tauna a-gale-ya.</i> |
|     | he he-IRR-steer                  | him I-saw-him           |
|     | ‘He (not the other) will steer.’ | ‘It was him I saw.’     |

With non-verbal clauses emphatic pronouns function as either non-verbal predicates or subjects.

- |     |                  |                  |
|-----|------------------|------------------|
| (2) | <i>geka tau.</i> | <i>tau geka.</i> |
|     | this me          | I here           |
|     | ‘This is me.’    | ‘I am here.’     |

2. Subject prefix – unstressed pronoun with a continuative or anaphoric function – the first prefix of the verbal predicate marked for person and number “agreement” with the subject NP – examples above and below. Within the wordlist they are written as free-form proclitics.

3. Object suffix – unstressed pronoun with a non-emphatic, referential function – the final clitic of the VP marked for “agreement” with a definite object NP.

- |     |                                     |
|-----|-------------------------------------|
| (3) | <i>polo a-matute-ya.</i>            |
|     | pig I-fear-it                       |
|     | ‘I feared (was afraid of) the pig.’ |

4. Possessive proclitic – stressed clitic pronoun marking the following head (possessed) noun for person and number agreement with the possessor NP.

- |     |                                    |
|-----|------------------------------------|
| (4) | <i>lawa hai tano hi-dewa-hi.</i>   |
|     | person their garden they-make-them |
|     | ‘The people made their gardens.’   |

The remaining functions have a single form – pronominal suffixes. They are bound forms; the third person singular form is given in the wordlist.

5. Possessive suffix – unstressed pronoun marking the person and number of the dependent or “possessor” NP by pronominal suffix on the head or bound noun. Used with kinship terms (example [5]), relationship terms, body parts and quantifiers.

- |     |   |
|-----|---|
| (5) | <i>a-nae hina-u po ama-u uyahi-hi..</i> |
|     | I-go mother-my and father-my to-them    |
|     | ‘I went to my mother and father...’     |

6. Adjectival suffix – marks the adjective for pronominal agreement with the head noun, again the pronominal suffixes are employed. In marking the dependent rather than the head the adjectival suffix is functionally distinct from the possessive suffix.

7. Post-nominal relator suffix – post-nominal relators are marked for person and number agreement with the dependent noun – examples (5) and (6).

- (6) *bada i-eno numa u gabouli-na.*  
 man he-sleep house LOC under-3s  
 ‘The man slept under the house.’

### 3.2 Tense, aspect and mood

Tense, aspect and mood are marked by various combinations of the free forms *apo* FUTURE and *amaka* COMPLETED; the prefixes *ta-* IRREALIS,  $\emptyset$ -REALIS and *na-* POTENTIAL; reduplication marks PROGRESSIVE and DURATIVE; and derivational prefixes mark PERSISTIVE and STATIVE.

### 3.3 Derivational prefixes

Verb derivation is extremely important to an understanding of the Tawala language. The main derivational prefixes are *wi-*, *lu-*, *li-*, *wo-* and *om-*. Besides their word deriving function (see Ezard forthcoming), they also play a major syntactic role in changing verbal valence and creating causatives and statives, and a minor role in changing the aspect and mode of the verb (see Ezard forthcoming). Almost any class of word can fill the root slot and an elaborate system of word subclasses is required to account for the intricacies of grammar and the nuances of meaning involved. Without doubt this is the most highly productive area of Tawala grammar. Numerous words in the wordlist are derived by means of these prefixes.

*Table 4.* Semantic fields and Tawala derivational prefixes

	<i>wi-</i>	<i>lu-</i>	<i>li-</i>	<i>wo-</i>
A. Nouns	become like item	‘go’ and do item	become new item	hold item
B. Adjectives	cause socially	become item	cause physically	cause by hand
C. Verbs	cause action	go item	cause physically	persist in action
D. Human propensity	speak of state	cause a state	cause a state	persist in state
E. Numbers	make number	grow/hit number	–	gather/hold number
F. Locational	relative motion	pile in location	–	put hand in location

Two things need to be noted about derivational prefixes: firstly, the prefix itself does not always have the same meaning. Secondly, the meaning of each prefix is dependent on the semantics of the root morpheme with which it is combined. Table 4 summarises the situation, listing the meaning the prefix is likely to manifest when it is combined with roots from various word classes.

The complexity of the subject precludes any adequate treatment within the scope of an overview and I merely list some examples of their use with adjectives.

(7) *hai baha hi-wi-dao-ya.*  
 3pl POSS talk 3pl-DER-long-3sg O  
 OBJECT----- S-CAUSE-ROOT-O  
 ‘They talked on and on.’

(8) *hai numa hi-li-dao-ya.*  
 3pl POSS house 3pl-DER-long-3sg O  
 OBJECT----- S-CAUSE-ROOT-O  
 ‘They extended their house.’

(9) *lawa hi-lu-gobu.*  
 people 3pl-DER-dirty  
 SUBJECT S-STATE-ROOT  
 ‘They are an unkempt people.’

(10) *nima-hi-yei hi-wo-i-gobu-ya.*  
 hand-3pl-ABL 3pl-DER-dirty-3sg O  
 INSTRUMENT S-HAND-ROOT-O  
 ‘They dirtied it with their hands.’

### 3.4 Reduplication

Another pattern of word formation which is very common in Tawala is reduplication of all or part of a word (see Ezard 1979 for detailed treatment). Often visitors to Milne Bay remark after only a few minutes of listening to Tawala on the reduplication in constant use. Reduplication basically encodes plurality or continuation of things and processes. The reason reduplication is so common in Tawala is that it functions at several grammatical levels.

### 3.4.1 Reduplication of nouns

Many nouns are reduplicated in their basic forms. Thus the wordlist contains many items like these:

<i>bagibagi</i>	‘work’
<i>kewokewou</i>	‘canoe’

Most nouns referring to humans are reduplicated for plural:

<i>hina-ta</i>	→	<i>hinahina-ta</i>
‘our mother’		‘our mothers’
<i>keduluma</i>	→	<i>kedukeduluma</i>
‘woman’		‘women’

### 3.4.2 Reduplication of adjectives

A large proportion of Tawala adjectives have a reduplicated form – usually derived from verbs.

<i>dewadewa-na</i>	‘good-3sg’
<i>witewitei-na</i>	‘heavy/difficult-3sg’
<i>titei-na</i>	‘pulled-3sg’

### 3.4.3 Reduplication of verbs

Many Tawala verbs can be reduplicated if the action is continuous or repeated.

<i>hi-woewoe-ya</i>	‘they kept on paddling it’
<i>hi-dewadewa-ya</i>	‘they were doing it’

We can combine these reduplicated words to form perfectly natural-sounding sentences – though it is not often that all the forms in the sentences would be reduplicated. I have constructed the following sentences to illustrate the point.

<i>kedu-keduluma</i>	<i>bagibagi</i>	<i>dewadewa-na</i>	<i>hi-dewa-dewa-ya.</i>
pl-woman	work	good-3sg	3pl-RED-do-3sg O
‘The women were doing good work.’			

<i>hina-hina-ta</i>	<i>kewokewou</i>	<i>witewitei-na</i>	<i>hi-woe-woe-ya.</i>
pl-mother-our	canoe	heavy	3pl-RED-paddle-3sg O
‘Our mothers were paddling the heavy (difficult) canoe.’			

### 3.5 Derivation of nouns

There are two highly productive proclitics for deriving nouns:

<i>tu</i>	‘person’
<i>ani</i>	‘place, thing’

Numerous examples of each are to be found in the wordlist.

### 3.6 Idiomatic verbs

Compounding is highly productive in deriving new forms as is evidenced by perusing the Tawala wordlist. Nowhere is this compounding more productive than in the area of “human propensity” or “psychological” compounds – mostly verbs – describing various emotional and mental states. The first element of the compound is a body part – *nugo-* ‘heart’, *mata-* ‘eye’, *hini-* ‘skin’ or *taniga-* ‘ear’. The second element of the compound is usually a stative verb root – *-apapoe* ‘bad’, *-pota* ‘blocked’, *-kadidili* ‘hard’, *-maga* ‘many’ etc.; though it is sometimes an active verb – *guluwi* ‘bury’ – or even a fossilised form, as in *nugo-neina* ‘to be ignorant’, *nugo-tuhu* ‘to think’.

Examples:

<i>nugoguluwi</i>	‘forget’
<i>nugokadidili</i>	‘be decisive’
<i>nugoapapoe</i>	‘be angry’
<i>matamaga</i>	‘be promiscuous’
<i>tanigapota</i>	‘be disobedient’

## 52. Motu

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>Thomas E. Dutton</i>
---------------	-------------------------

Wordlist:	<i>Andrew Taylor</i>
-----------	----------------------

---

### 1. Introduction

---

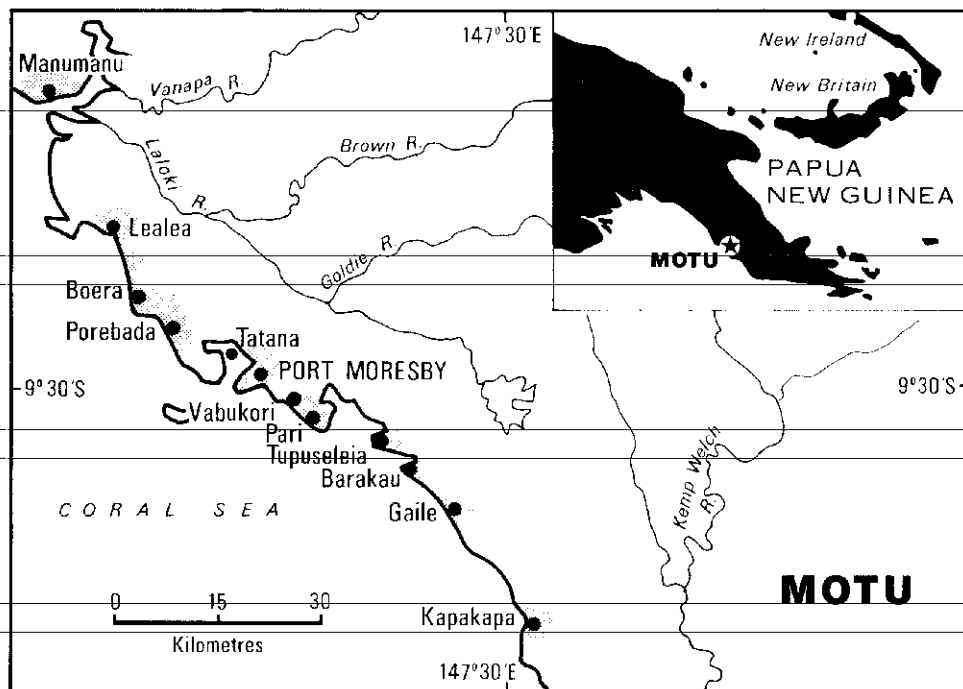

Motu is the Austronesian language spoken around Port Moresby, the capital of Papua New Guinea. It is spoken natively by an estimated 14,000 villagers who inhabit maritime villages spread out along the coast between Kapakapa (or Gabagaba) in the east and Galley Reach in the west, a distance of approximately one hundred and twenty kilometres (Wurm – Hattori 1981: map 9). Excluding the large village complex of Hanuabada situated in Port Moresby itself there are eleven Motu villages. Culturally and socially these villages are generally regarded as belonging to two sections or tribes, the Eastern Motu and the Western Motu, the former inhabiting the area east of Bootless Inlet and the latter the area west of it. This division also reflects dialectal differences although two of the Western villages, Tatana and Vabukori, are sufficiently different from the others to suggest that they probably ought to be regarded as a third dialect or as two closely related other dialects (Taylor 1970a: 1). At a higher level Motu is a member of the Proto Central Papuan sub-group of Papuan Tip Cluster languages and is most closely related to Gabadi and other Austronesian languages immediately to the west and thence to Sinagoro and Keapara immediately to the east (Ross 1988: 190-194).

Inland the Motu are bounded by speakers of languages of the non-Austronesian Koiarian family and to the east speakers of languages of the Kwalean family (Wurm – Hattori 1981: map 9). Of these the Motu were, at the time Europeans arrived, in closest contact with the Koiarian Koita and Koiari who inhabit areas approximately coterminous with the Western and Eastern Motu sections respectively.

At the time of first contact the Western Motu were engaged in long distance trading to the Gulf of Papua in annual trading cycles known in the literature as *hiri*. On these voyages they traded pots and other locally produced items for sago and other Gulf products. During these visits the Motu and their trade partners communicated in at least two different trade languages which were pidginised or simplified forms of the non-Austronesian

---

languages spoken by their trade partners. In addition to these two trade languages the Motu appear to have used a simplified form of their own language for communicating with those coming to visit them in their own villages. Following the establishment of the colony of British New Guinea in 1888 a form of Motu similar in many ways to this simplified Motu, and most probably based on it, became the lingua franca of the first official police force of the colony and eventually the unofficial language of administration in the colony, and subsequent Territory, of Papua. Because of its association with the police force this language became known as Police Motu, a name it kept until 1970 when its name was changed to Hiri Motu (Dutton 1985).

Map 52. Motu language area

Motu was the first language to be studied and used for literacy purposes in Papua New Guinea. In 1872 a number of Polynesian teachers were landed at Manumanu village by the London Missionary Society to begin work amongst them. Following the deaths of a number of these teachers, however, the mission was moved to Elevala, a section of the now large village complex of Hanuabada, in Port Moresby when the first European missionary, Dr W.G. Lawes, and family arrived to take charge of the mission in 1874. Lawes immediately set about learning Motu and producing literacy materials in it. His first book was called *Bukana Kunana: Levaleva Tuahia Adipaia* and contained reading lessons, some Bible translations and Bible

stories and hymns. Since then there have been many publications in and about the language (particularly by Lawes 1885, Lister-Turner 1913, Lister-Turner and Clark 1930, and Taylor 1970a) and most Motu are literate in their language. Many are also literate in English since primary, and more recently, secondary and tertiary, education in English has been available to them for many years. This contact with English, and Western culture generally, has had its effects on the culture and language of the Motu. These effects are most noticeable in the vocabulary of present-day Motu.

Because of the central geographical position occupied by the Motu, the widespread trading contacts they had established up and down the coast before Europeans arrived to settle in their midst, the diversity of languages spoken in the area, and the fact that Motu became the first language to be reduced to writing in the area, Motu naturally became the lingua franca of the London Missionary Society (Taylor 1977). This has helped in turn to establish prestige for the language and ensure its survival.

The most detailed study of Motu is to be found in Taylor (1970a) although Lawes' and Lister-Turner and Clark's various grammars and dictionaries are important supplementary works which contain much valuable historical information and descriptions of aspects of the language not covered by Taylor (1970a). Ethnographic notes on the Motu are to be found in Belshaw (1957), Groves (1954, 1960), Lawes (1879) and Taylor (1968).

## 2. Phonology

Motu has a relatively uncomplicated phonological system. All syllables are open. There is a small set of fifteen consonantal and five vowel phonemes; no complicating morphophonemic rules have to be registered.

The consonant phonemes of the recognised written standard form of the language are:

*Table 1. Consonants*

		Labial	Alveolar	Velar	Lab. velar	Glottal
Stops	vl	<i>p</i>	<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>	
	vd	<i>b</i>	<i>d</i>	<i>g</i>	<i>g<sup>w</sup></i>	
Fricatives	vl					<i>h</i>
	vd	<i>β</i>		<i>ɣ</i>		
Nasals		<i>m</i>	<i>n</i>			
Laterals			<i>l</i>			
Flaps			<i>r</i>			

Of these /t/ is manifested as [s] before high vowels and as [t] elsewhere. Otherwise /p/ is often realised as [f] or [ɸ] but particularly so at Gaire in the Eastern Motu section. In addition there is no /h/ in the Western Motu villages of Manumanu, Pari and part of Hanuabada and [r] often occurs where [l] is expected and vice versa in Lealea and Boera (to a lesser extent), also in the Western section. Formerly /l/ was generally realised as [n] in the Western villages of Tatana and Vabukori but is now only so realised in the speech of older speakers.

*Table 2. Vowels*

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

### 3. Morphology

Morphologically Motu is primarily a suffixing language. Amongst the most common suffixes are the following, which are used to mark inalienably possessed objects:

Person/Number	Form
1 sg	<i>gu</i>
2 sg	<i>-mu</i>
3 sg	<i>-na</i>
1 pl incl	<i>-da</i>
1 pl excl	<i>-mai</i>
2 pl	<i>-mui</i>
3 pl	<i>-dia</i>

This set is also used to mark objects of transitive verbs except that the 3sg form is *-a* (or *-ia* if the final vowel of the verb root is /a/) and not *-na*.

The suffixes *-na* and *-dia* are also used as definite articles on nouns and noun + adjective combinations, as in

*taunamo-na* 'the good man'  
man good-DEF

They are also used as a relators in partitive possessive phrases, derived nouns and relative clauses as in

*hanua tau-na*  
village person-sg  
'village person, villager'

*hanua tau-dia*  
village person-pl  
'village people, villagers'

*hahediba tau-na*  
teach person-sg  
'teacher'

*sisia e alai-a tau-na*  
dog 3sg kill-3sg man-REL  
'the man who killed the dog'

In addition the general enclitic *-ai* 'at' compounds with certain inalienably possessed nouns (usually in the 3sg form) to form postpositions:

*murinai* < *muri -na -ai* 'behind'  
back -3sg -at

*lalonai* < *lalo -na -ai* 'inside'  
inside- -3sg -at

*dekeguai* < *deke -gu -ai* 'beside me'  
side -1sg -at

Verbs in Motu have the structure:

resumptive pronoun + verb root + object marker or SVO.

The resumptive pronouns are:

1sg	<i>na</i>	1pl incl	<i>ta</i>
		1pl excl	<i>a</i>
2sg	<i>o</i>	2pl	<i>o</i>
3sg	<i>e</i>	3pl	<i>e</i>

These are free forms which cliticise on to the following verb root. They coalesce with the negative *asi* to give predictable forms (e.g., 1sg NEG is *asina*, 2sg NEG *asio*, 3pl NEG *asie*) except for the 2sg and 3sg present and past tense forms which are *to* and *se* respectively. The resumptive pronouns also coalesce with certain tense-aspect markers to give forms such as *baina*

'I will' (NEG: *basina* 'I will not'), *bama* 'if I' (NEG: *basinama* 'if I do not') for example, as in:

*ma ta eto*, "I *lau na* *haritari* *name*  
and one said, "I FOCUS just.now I.PRES

*headaβa be basina βasimu*".  
marry TOPIC FUT.NEG.1SG come.to.you"

'And one said, "I have just got married and so I cannot come".'

[Luke: 14.20]

*basio karaia eneheto`*  
FUT.NEG.2sg do.it thus

'Don't do it like that!'

*boma noia bema henimu.*  
2sg.SUBJUNCTIVE beg.him 3sg.SUBJUNCTIVE give you

'If you beg him he will give it to you.'

Verb compounding is common (especially with the verbs *abi-a* 'to get', *ato-a* 'to put' and *kara-ia* 'to make') and there are few irregular verbs.

Reduplication is also common (Taylor, 1970b).

#### 4. Sentence structure

Motu is generally regarded as an SOV language (although as already indicated the order of elements in a verb are SVO). Adjectives follow nouns, relative clauses precede their heads. Motu also has postpositions and few conjunctions. Adverbs of manner are generally incorporated into the verb.

## 53. Mekeo

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Alan A. Jones</i>
--

---

---

### 1. Introduction

---

---

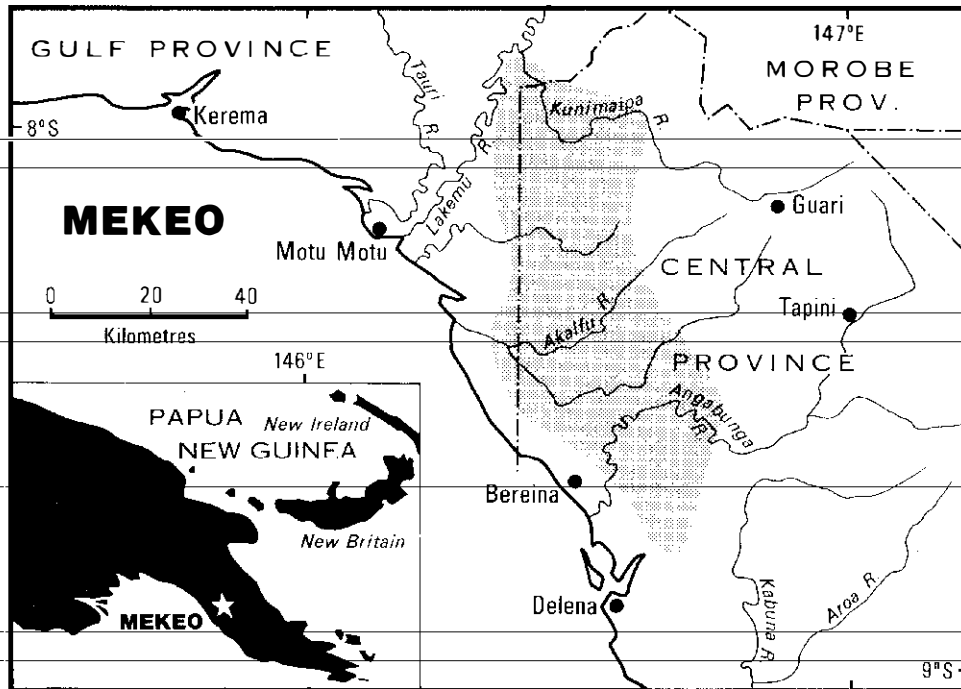

Mekeo is spoken by approximately 10,000 people. They inhabit fertile alluvial floodplains covered with primary or secondary rain forest or with tall kunai grass where not under cultivation. This terrain gives way to sago swamps in the west. The staple crop is, accordingly, either banana (in the east) or sago (in the west) – supplemented by taro, yam and sweet potato. Pigs are bred for feasts, and the bush is still relatively rich in game (e.g. wallaby, cassowary and smaller birds). Immediate neighbours to the south and east speak closely related Austronesian languages. The Roro occupy a narrow coastal belt that cuts the Mekeo off from direct access to the sea. The mountains and hills to the east are inhabited by the Kuni and the Lala (or Pokao). Traditional trade links ensured some regular contact in the past. To the north and to the west are speakers of non-Austronesian languages. Around Mt. Yule dialects of Kunimaipa and Tauade (Goilalan languages closely related to Fuyughe) are spoken; to the west, in Gulf Province, Eleman languages such as Toaripi are spoken. There is considerable trading with this latter group today – where in the past there was war, but also intermarriage – while contacts with the former were haphazard and essentially hostile until quite recently (a couple of very rudimentary pidgins testify to the initiation of restricted trade-links about 100 years ago).

There are four distinct dialects of Mekeo that have been variously labelled in the past. I have adopted a simple points-of-the-compass terminology here and refer to East Mekeo (= “Central Mekeo”), North Mekeo (= Amoamo), West Mekeo (= “Bush Mekeo”, Tati, Kaopo/Kaopu, Inaukina) and North-West Mekeo (= Kovio, Inaufanga, Inaupangau). They are mutually unintelligible except for North Mekeo which is a convergent dialect midway between East Mekeo and West Mekeo. I shall, for convenient reference, occasionally abbreviate these dialect names to EMek, NMek, WMek and NWMek respectively. It is EMek that has been chosen here to exemplify the lexicon of Mekeo, simply because our data for that dialect are more extensive and have been rechecked across different informants as well as

---

---

against documentary sources. Most items have been found to be cognate across the dialects, although irregular sound change sometimes obscures this fact.

Map 53. Mekeo language area

The word list that follows is based on elicited and unelicited materials recorded in the field over a total period of twelve months (chiefly from 1983 to 1984 but with a short follow-up period in 1986) and on unpublished mission documents which were checked against my own data upon my return to Canberra. Fr. Gustave Desnoës of the Mission of the Sacred Heart has compiled an invaluable dictionary (1933) of EMek based on the language notes of some dozen missionary priests (in particular Fr. Vitale) of Belgian, French and Italian nationalities, notes going back to the turn of the century and beyond. This was typed up and annotated by Fr. Hubert van Lamsweerde (completed in 1942; he is also the author of a grammar sketch [c1940] of much linguistic interest), and this is now available on microfilm. Rev. H.A. Brown of the London Missionary Society (now the Uniting Church) has also been kind enough to make available a short grammar and dictionary (Brown 1955) of NWMek (his "Kovio"). We are, moreover, fortunate in having access to three important ethnographic studies of the East Mekeo, by Seligmann (1910), Stephen (1974), Hau'ofa (1981); and one on the West Mekeo by Mosko (1985).

I take this opportunity to express my deep appreciation to all the missionary linguists, alive or dead, who have contributed wittingly or unwittingly to my

research, and my gratitude to particular friends among the Mekeo: Paul Aonga, Simon Abala, Carlo Iko, Simon Clement; Ame Louis Poloe, Bona Paeke, Joseph Akeba; and many, many others, for their time and their trust, and the great pleasure of their company.

## 2. Phonology

Syllable structure is (C)V, i.e. a syllable can consist of V (= vowel) or C + V (= consonant followed by vowel).

East Mekeo has only seven consonant phonemes:

Table 1. Consonants

	Labial	Alvcolar	Velar	Glottal
Stops	<i>p</i>		<i>k</i>	ʔ
Fricatives	<i>f</i>			
Nasals	<i>m</i>		<i>ŋ</i>	
Laterals		<i>l</i>		

/f/ has the free variants [f], [ɸ], [v] and [β], and /ŋ/ has the conditioned allophone [n] when adjacent to /i/ (preceding or following).

The consonantal phonemes correspond as follows between the four dialects (the vowels have the same values throughout):

NWMek	<i>b</i>	<i>p</i>	<i>w</i>	<i>g</i>	<i>k</i>	<i>m</i>	<i>ŋ</i>	<i>e, ø</i>
WMek	<i>b</i>	<i>p</i>	<i>w</i>	<i>g</i>	<i>k</i>	<i>m</i>	<i>ŋ</i>	<i>l, ø</i>
NMek	<i>p</i>	<i>f</i>	<i>w</i>	<i>g</i>	<i>k</i>	<i>m</i>	<i>ŋ</i>	<i>l, ø</i>
EMek	<i>p</i>	<i>f</i>	<i>f</i>	<i>k</i>	ʔ	<i>m</i>	<i>ŋ</i>	<i>l</i>

Comments on EMek /ŋ/ above apply to all dialects. /l/ is represented by a low, front [e] in NWMek. In WMek and NMek /g/ goes to [d] or [dzʷ] before [i] and /k/ goes to [t] or [tsʷ] in the same environment. EMek seems to have travelled furthest from Proto-Mekeo. Considerations of “natural” sound change indicate a progression from NWMek through WMek and NMek to EMek. A small inventory of consonantal phonemes has been reduced by one in EMek. [l] has accreted to word-initial /a/ and /o/ in many instances, an innovation that is gradually being borrowed into NMek and WMek.

EMek, NMek and WMek are all undergoing a progressive process of consonantal intrusion in the phonetic environment /i\_a (and to a much lesser extent /i\_o). A slurred palatal glide has advanced to [s] in EMek (in all

available lexical and grammatical environments), to [ʒ] or [z] in NMek, and to [d] in WMek (albeit not in every possible item). In NWMek some speakers pronounce [y] in the same phonetic environment.

Length is phonemic in EMek, although this feature does not carry a heavy functional load. Such is not the case in the other dialects and is undoubtedly a result of consonantal attrition in EMek. Length is written as a double vowel and may be pronounced with two syllabic beats separated by a brief pause or even a faint glottal stop.

Word stress falls, as a general rule, on the penultimate syllable. However, word-final *-na/-ŋa* is subject to elision where this would follow a syllable ending in *-a* and this results in word-final stress plus some degree of compensatory lengthening of the vowel. Thus:

\**ima - ŋa*, 'hand - 3sg' → *imā*, written *imaa* 'his/her hand'

This kind of marked stress can be very faint and is sometimes as much understood as perceived.

In East Mekeo (and the other dialects) there are five vowel phonemes, as follows:

*Table 2. Vowels*

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

### 3. Morphology and syntax

The syntactic functions are usually coded in the verbal clause by both morphological cross-referencing and by the order of the constituents. Thus subject-marking prefixes and object-marking suffixes appear in the VP; while the unmarked word order of a (di-)transitive clause adheres to the schema: S - IO - O - VP.

*lo pia imoi oo e - peni - a*  
 chief child banana 3sg-give - 3sg  
 'The chief gave the child banana(s).'

Note that IO outranks O with regard to verbal agreement, determining the person and number of the object-marking suffix. A number of circumstantial

case-roles can be added – in any order – and are all uniquely marked by the “oblique” case-marking suffix *-ai* (obl).

Pragmatic structure frequently overrides syntactic structure in discourse. The pragmatic structure of a ditransitive clause such as the one given above can be represented as follows:

Comment			
Topic	Pre-focus	Focus	Verbal Expansion
S	iO	O	VP

Syntactic O is, in other words, the unmarked information Focus, falling as it does into the critical, immediately pre-verbal slot. In the intonation structure, Focus is realised by a tonic accent with falling stress, preceded by a steadily rising tone and a pause. The concept of syntactic markedness has very limited explanatory value in itself and the Focus is almost as likely to be S, or IO, as O. The Patient or Goal is very frequently the Topic. In the absence of an NP Focus, the VP itself is the Focus.

Although we can isolate a number of special closed word classes such as deictics, sentence adverbs and exclamations, there is no principled way in which we can divide the lexical bases into a noun class and a verb class. There *is*, however, a small “class” of “true” adjectives. Any lexical base may appear in either a nominal or a verbal function. The most one can say is that such and such is a typically nominal base, or a typically verbal base, with vague reference perhaps to the inherent time-stability of the concept involved. But any concept may in principle be realised either as an entity or a fact (i.e. perfectly, nominally) or as a process or an event (i.e. imperfectly, verbally). Having made this proviso, I shall continue upon occasion to make use of the terms “noun” and “verb” to describe the uses of bases.

Usage is somewhat stricter when it comes to determining the transitivity of a given base when it is functioning verbally. Thus, for certain verbs S will “always” be a Patient, for others S will “always” be an Actor. However, for a considerable number of verbs either can be the case, in as much as they can occur transitively or intransitively. Typically intransitive verbs are transitivised/causativised by addition of the prefix *pa-* or the suffix of remote transitivity *-ai*. Typically transitive verbs can be used intransitively by simply omitting the object-marking suffix, or “passivised” by means of the prefix *i-* (which also productively nominalises typically transitive verbal bases). *pi-* has a reciprocal/distributive function.

The Mekeo verbal paradigms encode tense (non-future versus future), aspect (perfective, imperfective and habitual), and mood (realis, irrealis and intentional: obligative or imperative). My citation form for verbs is the non-future/imperfective indexed for a 3sg subject and, where appropriate, for a 3sg object. For example, *e-au-ŋa*, although glossed as ‘strike’, actually translates as ‘he/she/it strikes him/her/it’. *-ŋa* also functions as the optional 3sg focus marker on nominal predicates (elsewhere interpreted as a possessive suffix).

Note that while object-marking *-ŋa* corresponds with imperfective *-nia*, some verbs have invariable *-ia*, or *-a/-ia* (for a mixture of reasons, phonological and semantic).

## 54. Roviana

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>Darrell T. Tryon</i>
---------------	-------------------------

Wordlist:	<i>Josephine Wheatley</i>
-----------	---------------------------

---

### 1. Introduction

---

Roviana is perhaps the best known language of the western Solomon Islands. It is spoken as a first language by approximately 5000 speakers on the island of New Georgia and the islands of the Roviana Lagoon, including Gizo, Vonavona and Kohinggo. It is the best known of a sub-group of closely related languages which include:

---

	Language	Location
1.	Ghanongga	Ranongga Is.
2.	Lungga	Ranongga Is.
3.	Simbo	Simbo Is.
4.	Nduke	Kolombangara Is.
5.	Roviana	New Georgia
6.	Ughele	Rendova
7.	Kusaghe	New Georgia
8.	Hoava	New Georgia
9.	Marovo	New Georgia
10.	Mbareke	New Georgia
11.	Vangunu	New Georgia

---

Roviana is also well-known throughout the western Solomons as a lingua franca. It was adopted as a language of evangelisation by the Methodist Mission of Australasia, which established a mission station at Roviana, New Georgia in 1902. As far as mission publications in Roviana are concerned, they are surprisingly few in number, namely the Gospels of Matthew, Mark and John (1932), Luke (1940) and the New Testament (1953). In addition, there was a hymn book and a catechism. In view of the mission emphasis on literacy, the absence of secular literature in Roviana is puzzling.

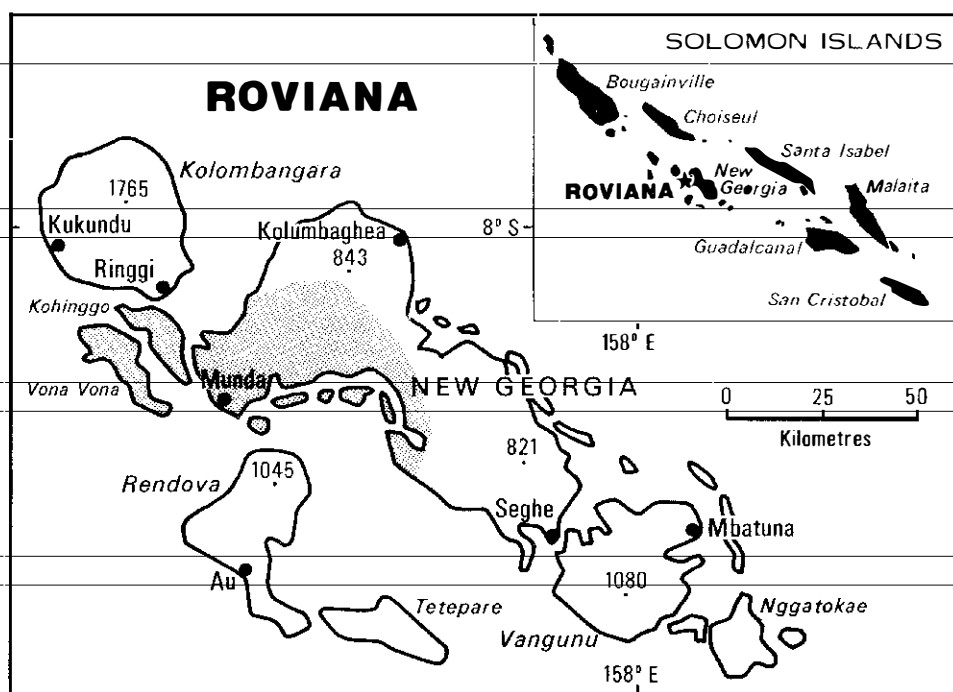

Woodford (1890) was the first to publish on Roviana, a vocabulary in his *A naturalist among the headhunters*. In 1896 Somerville and Weigall

---

---

published further lexical material, and Ray (1897) published vocabularies and specimens of Roviana sent to him by Somerville. Ribbe's work (1903: 187-193) also contains a Roviana vocabulary.

In 1926 S.H. Ray published a short grammar of Roviana, based on materials sent to him from the Methodist Mission in New Georgia. In 1928 Waterhouse published a *Roviana and English dictionary* (revised and enlarged by L.M. Jones, 1949). It is interesting that the practical orthography adopted for Roviana followed that established earlier for Fijian, not surprisingly, as many of the early evangelists in the western Solomons were in fact Fijians. Since Waterhouse, there has been little published on Roviana, apart from Todd (1978) and Ross (1988).

Map 54. Roviana language area

## 2. Phonology

The phonemes of Roviana are as follows:

Table 1. Consonants

		Labial	Laminal	Dorsal	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>k</i>	
	vd	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives	vl		<i>s</i>		<i>h</i>
	vd	<i>v</i>	<i>z</i>	<i>y</i>	
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Flaps			<i>r</i>		

Voiced stops are prenasalised.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Stress falls mostly on the penultimate.

### 3. Morphosyntax

#### a) Pronouns

	Focal	Object	Subject	Possessive
I	<i>arau</i>	<i>au</i>	<i>rau</i>	<i>-gu</i>
You	<i>ayoi</i>	<i>yo</i>	<i>yoi</i>	<i>-mu</i>
He	<i>asa</i>	<i>a</i>	<i>sa</i>	<i>-na</i>
We pl incl	<i>yita</i>	<i>yita</i>	<i>yita</i>	<i>-da</i>
We pl excl	<i>yami</i>	<i>yami</i>	<i>yanu</i>	<i>-mami</i>
You pl	<i>yamu</i>	<i>yamu</i>	<i>yamu</i>	<i>-mia</i>
They pl	<i>arikasa</i>	<i>i</i>	<i>ari</i>	<i>-dia</i>
We dl incl	<i>yitakara</i>			
We dl excl	<i>yamikara</i>			
You dl	<i>yamukara</i>			
They dl	<i>arikara</i>			

## b) Formatives:

Nouns are derived from verbs/adjectives by prefixing or infixing *in-/in-*.

Examples:

<i>avoso</i>	'to hear'	→	<i>in-avoso</i>	'news'
<i>ene</i>	'to walk'	→	<i>in-ene</i>	'journey'
<i>tavete</i>	'to work'	→	<i>t-in-avete</i>	'work'
<i>zama</i>	'to say'	→	<i>z-in-ama</i>	'word, saying'

Vowel-initial verb stems take the prefix form, while consonant-initial forms take the infixed formative.

Other productive affixes include *va-*, causative and *vari-*, reciprocal. These too follow the infixation rule.

Examples:

<i>yila</i>	'to know'
<i>va-yila</i>	'to show'
<i>v in a yila</i>	'a sign'
<i>vari-pera</i>	'to fight'
<i>v-in-ari-pera</i>	'war, fighting'
<i>v-in-ari-haba</i>	'marriage'

Another noun formative, with intransitives, is *-ana*.

Examples:

<i>habotu</i>	'to sit'	<i>habohabotu-ana</i>	'sitting places'
<i>siyoto</i>	'to anchor'	<i>siyoto-ana</i>	'anchorage'

## c) Possessive suffixes

The possessive suffixes *-gu*, *-mu*, *-na* etc., which denote pronominal possession with nouns throughout the region are also suffixed to noun modifiers (adjectives).

Examples:

*baŋara lea-mu si ayoi*  
 master good-2sg you sg.  
 'You are a good master.'

*arau si na tie kalea-gu*  
 I art. man bad-1sg  
 'I am a bad man.'

*keke togere ululu-na*  
 one mountain high-3sg  
 'One high mountain.'

## d) Syntax

Roviana is basically a VSO language, unlike most of the Austronesian languages of Island Melanesia, where an SOV word order is the norm. SVO structures do occur, however.

Examples:

<i>doyori-yo rau</i> see -you I 'I saw you (sg).'	<i>doyori-a rau sa tie</i> see -him I art. man 'I saw a man.'
---	---

<i>luli-au sa si arau</i> follow-1sg 3sg 1sg 'He follows me.'	<i>luli-yo rau si ayoi</i> follow-2sg 1sg 2sg 'I follow you.'
---	---

<i>ele mai si rau</i> past come I 'I have come.'	<i>kagu toa si asa</i> fut. live he 'He will live.'
--	---

*lopu tayo-a ri*  
neg. believe-him they  
'They did not believe him.'

e) *si*

With both verbal and non-verbal clause types, *si* introduces the absolutive.

Examples:

*vineki ziqaziqarana si asa*  
girl light-skinned she  
'She is a light-skinned girl.'

*korapa mae si asa kamahire*  
pres. cont. come she now  
'She is coming now.'

Where emphasis is sought, and the VSO word order becomes SVO, *si* precedes the verb phrase. Thus:

*sa dokta si kote yasi-a sa moyo*  
art. doctor fut. lance-it art. boil  
'The doctor will lance the boil.'

sa tina-na si kote va-susu-a si asa kamahire  
 art. mother-his fut. caus-nurse-him him now  
 'His mother will nurse him now.'

For a full discussion of the role of *si*, which plays such an important part in Roviana syntax, see Todd (1978) and Ross (1988: 240-247).

## 55. Maringe (Cheke Holo)

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Geoffrey M. White</i>
---

---

### 1. Introduction

---

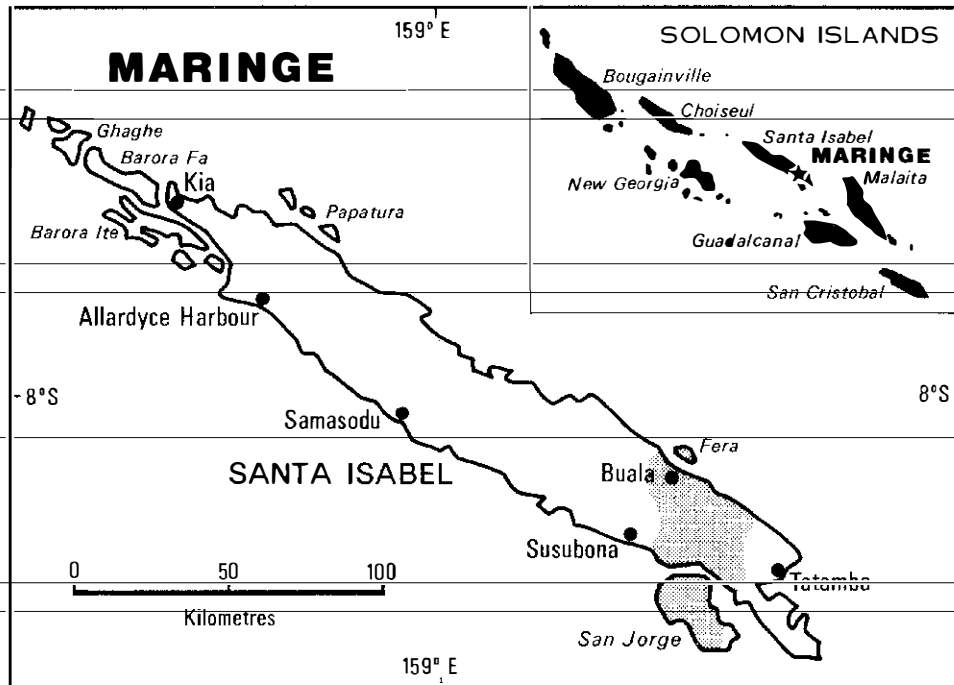

Cheke Holo, also known in its various subregions as Maringe, Hograno and A'ara, is the most populous language of central Santa Isabel in the Solomon Islands. As the name Cheke Holo indicates (literally 'bush language' or 'uplands language'), the speakers of this language once lived in the mountainous south-central region of the island. With the advent of peace and Christianity at the turn of the century Cheke Holo speakers settled in the Hograno and Maringe coastal regions on opposite sides of the island. Throughout the island as a whole, this pattern has produced a string of dialect "bands" running crosswise along the island's northwest/southwest axis (see White et al. 1988).

Cheke Holo is one of four distinct languages of Santa Isabel. Except for the Bughotu language in the southeastern corner of the island, all of the Santa Isabel languages may be classed within a Western Solomons subgroup (see Tryon – Hackman 1983; Hackman 1968). Cheke Holo is situated at the eastern boundary of that subgroup, bordering Bughotu which is included in a south-eastern grouping. Spoken by about 7,500 people in 1987, Cheke Holo is the language of about half of the island's population, and the centre of linguistic variation among eight named languages and dialects (White 1978; Whiteman – Simons 1978).

The most comprehensive work on Cheke Holo is a dictionary and grammatical sketch published recently by White – Kokhonigita – Pulomana (1988). Prior to that there had been very little documentation of the language. Following Gabelentz (1861, 1879), Ray (1926: 529-532) published grammatical notes on several Isabel languages, including Cheke Holo, referred to as the "bush language". There have been very few publications in Cheke Holo due to the fact that the neighbouring language of Bughotu was selected by the Anglican church as the medium for missionary work. However, at least one prayer booklet was printed in Cheke Holo prior to World War II, and a hymnal was published in 1975 by a Maringe translation committee. David Bosma, working in Maringe for the Summer

---

Institute of Linguistics, produced a recommended spelling (1981a), a word list (1984), and several short texts in Cheke Holo between 1981 and 1986 (1981b, n.d.).

Map 55. Maringe language area

The material on the Cheke Holo language presented here was gathered by the author with the assistance of his wife (Nancy Montgomery) and many local people during 15 months of fieldwork in 1975 and 1976, and several two-month visits in 1984, 1987 and 1988. Most of this fieldwork has been carried out in the Maringe area, primarily in villages in the Hofi area to the east of the Maringe lagoon, and in Buala village adjacent to the Provincial centre. Of the numerous Maringe people who contributed to this work, the co-authors of the Cheke Holo dictionary, Francis Kokhonigita (now deceased) and Hugo Pulomana, made especially valuable and extensive contributions. For further details about the many others who have facilitated the author's study of Cheke Holo, see White et al. (1988: vi).

## 2. Phonology

### 2.1 Inventory of consonants

Cheke Holo has 32 consonant phonemes:

Table 1. Consonants

		Labial	Alveolar	Palatal	Velar	Glottal
Stops/Affricates	vl	<i>p</i>	<i>t</i>	<i>ç</i>	<i>k</i>	<i>ʔ</i>
	vd	<i>b</i>	<i>d</i>	<i>ʝ</i>	<i>g</i>	
	aspirated	<i>p<sup>h</sup></i>	<i>t<sup>h</sup></i>		<i>k<sup>h</sup></i>	
Fricatives	vl	<i>f</i>	<i>s</i>			<i>h</i>
	vd	<i>v</i>	<i>z</i>		<i>ɣ</i>	
	aspirated				<i>ɣ<sup>h</sup></i>	
Nasals	vl	<i>m̩</i>	<i>n̩</i>	<i>ɲ̩</i>	<i>ŋ</i>	
	vd	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
Laterals	vl		<i>l̥</i>			
	vd		<i>l</i>			
Flaps	vl		<i>ɾ</i>			
	vd		<i>r</i>			
Semivowels		<i>w</i>				

**2.2.1 Discussion:** The most distinctive characteristic of the Cheke Holo phonemic repertoire is the extensive use of aspiration, breathy voice, and voiceless continuants.

The voiced fricative /z/ appears to be disappearing from the language, increasingly replaced by /ʝ/ in the idiolects of younger speakers. Thus, the /gaizu/ of older speakers is more often heard today as /gaiju/. The voiced labial /w/ does not appear in vernacular terms, but has entered Cheke Holo through the adoption of Pijin terms such as *wiki* (week) and *wasi* (wash). Finally, a high proportion of words with the voiced labio-dental /v/ are borrowings from the Bughotu language, particularly where that sound occurs word initially.

## 2.2 Inventory of vowels

Cheke Holo has five vowel phonemes:

Table 2. Consonants

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

### 2.3 Notes on morphology

For a detailed discussion of word and sentence construction in Cheke Holo, see White et al. (1988).

The two most common prefixes in Cheke Holo are the causative *fa* and the nominaliser *na*. Where a vowel-initial stem is subject to affixation, the vowel is glottalised, as in *elo* (float) and *naʔelo* (floating object) or *iho* (be ignorant) and *faʔiho* (confuse). In some uses of the nominalising prefix, the vowel of the prefix is dropped, as in *ifu* (blow) and *nifu* (wind instrument).

For verbs beginning with voiceless stops (/k/, /p/, /t/), with the liquid sounds /l/ and /r/, and the voiced velar fricative /ɣ/, nominalisation is achieved through phonological shifts. For the voiceless stops, noun forms are aspirated. Thus, *koʔu* ('drink') becomes *kʰoʔu* ('water'), *poloru* ('compensate') becomes *pʰoloru* ('compensation'), and *tatagru* ('pound tapa') *tʰatagru* ('tapa pounder'). For many verbs beginning with /l/ and /r/, nominalisation is achieved by accreting a /g/ to the initial consonant. Hence, *lehe* ('die') becomes *glehe* ('death'), and *ragi* ('dance, vb') becomes *gragi* ('dance, n'). Finally, for verbs with the velar fricative /ɣ/ in initial position, the noun form is often indicated with the velar stop /g/, as in *yoɾa* ('paddle, vb') and *goɾa* ('paddle, n').

In Cheke Holo, as in most Oceanic languages, reduplication in verb forms is a common means of indicating emphasis, duration and/or transitivity. Phonologically, reduplication for base words of the usual CVCV shape is accompanied by the deletion of the second consonant, producing CVVCVCV. For example:

<i>dalu</i>	'wash face'	becomes	<i>daudalu</i>
<i>nali</i>	'pile stones'	becomes	<i>nainali</i>
<i>selu</i>	'coax'	becomes	<i>seuselu</i>

Where the same vowel occurs both medially and finally, reduplication produces double vowel forms, as in *čeke* (talk) and *čeečeke*. It is also common in pronunciation to drop the second vowel in the double vowel syllable (in the examples above: *dadalu*, *nanali*, *seselu*, *čečeke*).

Cheke Holo employs two object markers, *ni* and *di* (singular and plural, respectively) that typically follow transitive verbs and precede their objects. In some cases, the object marker is contracted to /i/. Thus,

<i>atʰani</i>	'get it'	becomes	<i>atʰai</i>
<i>koko ni</i>	'throw it'	becomes	<i>kokoi</i>

In some cases, the final vowel of the verb is itself replaced by the transitivity */i/*:

*aknu* becomes *akni*  
*noŋo* becomes *noŋi*

## 56. Lau

---

---

<b>Contributors:</b>
----------------------

Introduction:	<i>Darrell T. Tryon</i>
---------------	-------------------------

Wordlist:	<i>Ellison Suri</i>
-----------	---------------------

---

### 1. Introduction

Lau is spoken by approximately 10,300 speakers on the eastern side of the island of Malaita in the Solomon Islands. It is spoken in a geographically discontinuous area, as follows: in northern Malaita on Ndai Island and along the coast and offshore artificial islands (well known from Ivens 1930) as far as Kwai Harbour; in southern Malaita around the Port Adam area. The reason for this dislocation is that the Port Adam area was resettled from the Ataa area in north-eastern Malaita. Three major dialects of Lau are distinguished: Suafa, Lau and Dai (Ndai).

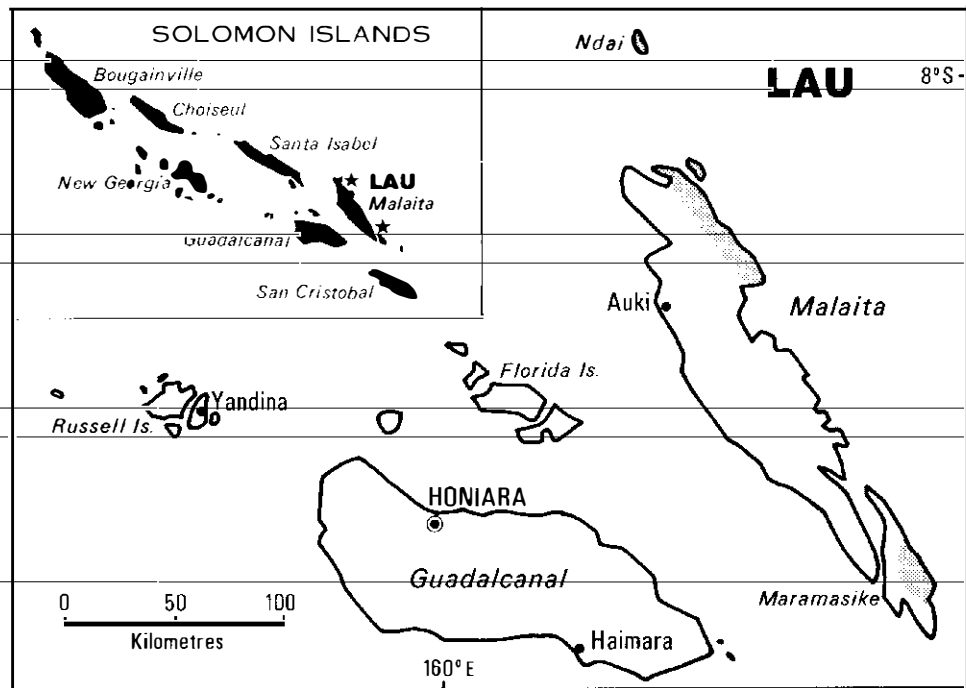

Previous descriptions of Lau have almost all been written by missionaries working on Malaita. Among the most important are Ivens (1921), a revised edition of which appeared in 1929. This revision was based on a stay at Fouia in 1927, almost in the centre of Lau territory. His 1921 work had been based on southern Lau spoken around Port Adam. Ivens also published a vocabulary of the Lau language (1932). In 1974 Fox produced a *Lau dictionary*, which was the first Lau publication to indicate phonemic vowel length and the glottal stop. Fox's informants, however, did not distinguish between /s/ and /h/, diagnostic of dialect differences, see section 2.

A considerable evangelical literature exists in Lau. Matthew's Gospel in Lau first appeared in 1905 (*Na tatalofa Diena Mala a Matthew e kedeana*), followed by the four gospels in 1910. The Book of Genesis was first translated in 1914 (*Na buk Genesis sulia baela i Lau*). The complete New Testament (*Gwalulaa faalu a faamourigia a aarai gia a Jesus Christ*) appeared in 1929, prepared by W.G. Ivens. In his introduction to Fox (1974), Miranda comments that "None of the (mission) publications indicate the glottal stop; most of them do not note vowel length, which is phonemic; and any attempts to create a consistent orthography for the language seem to have failed" (1974: iv). It should be pointed out, however, that since Miranda's remarks efforts have been made to produce standardised orthographies for Malaitan languages; see especially Simons (1979).

---

---

Map 56. Lau language area

## 2. Phonology

The consonant phonemes of Lau are as follows:

Table 1. Consonants

	Bilabial	Alveolar	Velar	Labialised velar	Glottal velar
Stops		<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>	<i>ʔ</i>
	<i>b</i>	<i>d</i>	<i>ɣ</i>	<i>ɣ<sup>w</sup></i>	
Fricatives	<i>f</i>	<i>s</i>			<i>h</i>
Nasals	<i>m</i>	<i>n</i>	<i>ŋ</i>		
Laterals		<i>l</i>			
Flaps		<i>r</i>			
Semivowels	<i>w</i>				

Note that /h/ is realised as [h] by coastal speakers, but as [s] by some of the mainland Lau. /w/ is pronounced as [ŋ<sup>w</sup>] by the northern Lau, but simply as [w] by the southern Lau (Fox 1974:205).

The vowels of Lau are as follows:

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a ā</i>	

Vowel length is phonemic in Lau. Pairs distinguished by vowel length include:,

<i>ma</i>	'and'	<i>mā</i>	'eye'
<i>ari</i>	'call out'	<i>āri</i>	'tie firmly'
<i>bula</i>	'turn'	<i>būla</i>	'keel of canoe'
<i>koko</i>	'old'	<i>kokō</i>	'grandparent'
<i>fufu</i>	'swell'	<i>fūfū</i>	'spider'
<i>nini</i>	'shrub sp'	<i>ninī</i>	'a pair'

### 3. Morphology

#### a) Pronouns:

The Lau pronominal system is as represented in the following table:

Table 3. Lau pronouns

	Free forms	Subject markers general	Subject markers co-ord	Negative	Object suffixes	Possessive suffixes
Singular						
1	<i>nau</i>	<i>ku</i>	<i>kua</i>	<i>ku si</i>		<i>-gu</i>
2	<i>ʔoe</i>	<i>ʔo</i>	<i>ʔoko</i>	<i>ʔo si</i>		<i>-mu</i>
3	<i>nia</i>	<i>ʔe</i>	<i>ka</i>	<i>si</i>	<i>a</i>	<i>na</i>
Dual						
1 incl	<i>goro</i>	<i>goro</i>	<i>goro ka</i>	<i>goro si</i>		<i>-goro</i>
1 excl	<i>gemere</i>	<i>mere</i>	<i>mereka</i>	<i>mere si</i>		<i>-mere</i>
2	<i>gomoro</i>	<i>moro</i>	<i>moroka</i>	<i>moro si</i>		<i>-moro</i>
3	<i>dāro</i>	<i>darō</i>	<i>darō ka</i>	<i>darō si</i>	<i>-darō</i>	<i>-darō</i>
Plural						
1 incl	<i>golu</i>	<i>golu</i>	<i>golu ka</i>	<i>golu si</i>		<i>-golu</i>
1 excl	<i>gemelu</i>	<i>melu</i>	<i>meluka</i>	<i>melu si</i>		<i>-melu</i>
2	<i>gomolu</i>	<i>molu</i>	<i>moluka</i>	<i>molu si</i>		<i>-molu</i>
3	<i>dalū</i>	<i>dalū</i>	<i>daluka</i>	<i>dalū si</i>	<i>-dalū</i>	<i>-dalū</i>

	Free forms	Subject markers general	Subject markers co-ord	Negative	Object suffixes	Possessive suffixes
1 incl	<i>gia</i>	<i>gia</i>	<i>giaka</i>	<i>giasi</i>		<i>-ga</i>
1 excl	<i>gami</i>	<i>mi</i>	<i>mika</i>	<i>mi si</i>		<i>-mami</i>
2	<i>gamu</i>	<i>mu</i>	<i>muka</i>	<i>mu si</i>		<i>-miu</i>
3	<i>gera</i>	<i>da</i>	<i>daka,</i> <i>gcra ka</i>	<i>dasi,</i> <i>gcra si</i>	<i>-da</i>	<i>-da</i>

## Examples of usage:

*boboŋi nau ku lea*  
tomorrow I subj go  
'I will go tomorrow.'

*nau laŋiku si lea*  
I- not-subj-neg-go  
'I will not go.'

*nau ku si ada-si- a na ola*  
I- subj-neg-see-trans-obj art canoe  
'I did not see the canoe.'

## b) Affixation:

The principal affixes in Lau are as follows:

reciprocal	<i>k<sup>w</sup>ai-</i>
reflexive	<i>taŋa-</i>
causative	<i>fā-</i>
transitive	<i>-fi, -li, -mi, -ŋi, -ri, -si, -ʔani</i>
instrumental	<i>i-</i>
nominalising	<i>-ŋa, -fa</i>
ordinal	<i>-na</i>
multiplicative	<i>fe-</i>

## 57. Kwaio

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Roger M. Keesing</i>
---

---

---

### 1. Introduction

---

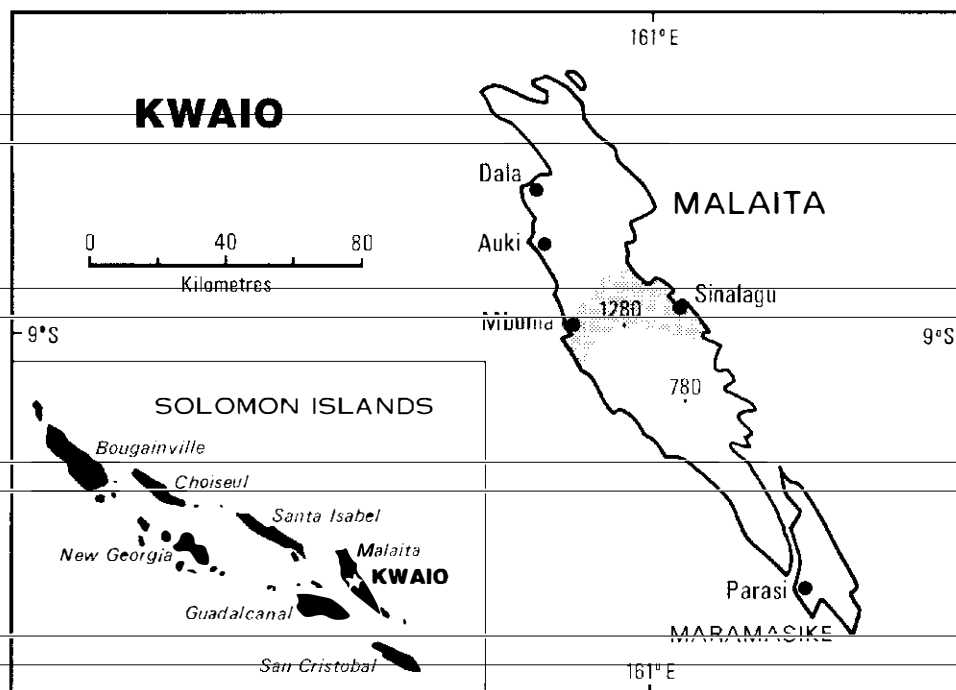

---

Kwaio is an Oceanic Austronesian language spoken on Malaita, Solomon Islands. Kwaio is spoken by some 10,000 people, whose homeland lies in a strip across the mountainous centre of the island. Nowadays many speakers of Kwaio are scattered around the Solomons, in plantation areas of the western Solomons and Guadalcanal, and in the urban centre, Honiara. Among the speakers of Kwaio, some 2,000 remain obdurately pagan, living in scattered homestead clusters in the mountains above the east coast. There are some minor differences in phonology and grammar distinguishing speakers from the west coast (Kwareuna) from those on the eastern side, and considerable lexical variation (partly due to word tabooing, which among the pagans is still an active process). The version represented here is spoken by pagans in the mountains above Sinalagu on the east coast, which in terms of population density constitutes the Kwaio heartland. Lexical borrowings from Solomon Islands Pijin are most common among the coastal Christians.

As of late 1989, no subgrouping of Malaitan languages had been systematically advanced. Most specialists had assumed that the Malaita languages, with the possible exception of the language spoken on Small Malaita and Ulawa, constituted a single subgroup. Keesing (1985) had suggested a possible subgrouping distinguishing a north-central group of Malaita languages and a southern group. He suggested that the north-central languages would probably fall into two subgroups:

- (1) A northern subgroup, including a cluster of mutually intelligible dialects (To'aba'ita, Baelelea, Lau and Baegu); Fataleka; and Kwara'ae.
  - (2) A central subgroup consisting of Kwaio, Doorio, Kwaikwaio, and probably Langalanga. This central subgroup is probably coordinate with a southern subgroup including 'Are'are and related languages/ dialects spoken around the Maramasike passage (and possibly Sa'a/ Ulawa, though the probability that this subgroups with San Cristobal languages was noted).
- 
-

A subgrouping departing from this in only one major respect has just been systematically proposed and argued by Lichtenberk (1988). Taking a series of phonological innovations as major diagnostic features, Lichtenberk proposes a “Central and North Malaitan” subgroup; and he notes that “there is some evidence for a subgroup consisting of Kwai [the language of two tiny islands], Langalanga, Kwaio and Dori’o” (1988: 45) – i.e. corresponding to the central subgroup which I anticipated. Lichtenberk proposes a South Malaitan-Cristobal group coordinate with Central-North Malaitan. The only deviation from Keesing’s expectation is Lichtenberk’s inclusion of ’Are’are (and its Marau dialect) in the South Malaitan-Cristobal group. I continue to believe that ’Are’are – though not Sa’a – will turn out to belong with the other languages of Malaita proper (both on cultural grounds and on the fact that ’Are’are is partly intelligible to me as a Kwaio speaker, while the languages of Makira are almost totally opaque).

Map 57. Kwaio language area

The Malaita languages and Cristobal languages (and Longgu, spoken on the Guadalcanal coast) form a Cristobal-Malaita subgroup clearly distinguishable on the basis of phonological innovation. Pawley (1972) advanced persuasive arguments to support a subgrouping of Cristobal-Malaita languages with a coordinate Guadalcanal-Nggela group to form a subgroup of Oceanic he called “Southeast Solomonian”. Although Blust

(1984) proposed some grounds (primarily a handful of supposedly exclusively shared semantic innovations) for grouping Cristobal-Malaita languages not with Guadalcanal-Nggela languages but with the Nuclear Micronesian languages, Lichtenberk has provided further convincing support for Pawley's original subgrouping.

Assuming that the Southeast-Solomonic subgroup will be confirmed by further evidence, a final question of wider subgrouping remains. Is Southeast Solomonic a first-order group within Oceanic, or does it fall (as Pawley had proposed in 1972) into an Eastern Oceanic subgroup (along with North-Central Hebridean, the Fiji cluster, and the Polynesian [and probably the Nuclear Micronesian] languages)? Pawley (1977) has since left Southeast Solomonic out of a "Remote Oceanic" subgroup, on grounds that no clear evidence for its inclusion (in contrast to possible shared retentions from Proto-Oceanic) have been demonstrated.

Whatever the precise relationship between Kwaio and adjacent Malaita languages, they are all fairly closely related. All of them are quite strikingly conservative in preserving patterns reconstructed (by Pawley and others) for Proto-Oceanic, and a substantial lexicon derived from forms reconstructed for POC.

## 2. Phonology

Kwaio preserves the five vowel system reconstructed for POC: *a e i o u*. Paired vowels and doubled vowels are common (and are treated as such, rather than as diphthongs or as lengthened vowels, in the operation of stress rules). In many cases the pairing and doubling of vowels reflects the historical disappearance of a *\*t* phoneme (*\*t* >  $\emptyset$ ) in the Cristobal-Malaita languages: *mate* > *mae* 'die'; *tabu* > *abu* 'taboo'; *tasi* > *asi* 'sea'; *mata* > *maa* 'eye'; *kutu* > *?uu* 'louse' etc.

Kwaio consonants reflect a voiced/unvoiced contrast, a nasalised/non-nasalised contrast and a contrast between labialised and unlabialised velars:

Table 1. Consonants

	Labial	Alveolar	Velar	Labialised velar	Glottal
Stops	vl	<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>	ʔ
	vd	<i>b</i>	<i>d</i>	<i>g<sup>w</sup></i>	
Fricatives	<i>f</i>	<i>s</i>			
Nasals	<i>m</i>	<i>n</i>	<i>ŋ</i>	<i>ŋ<sup>w</sup></i>	
Liquids		<i>l</i>			
Semivowels	<i>w</i>				

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

The voiced consonants *b d g g<sup>w</sup>* are prenasalised with the homorganic nasal [m<sup>b</sup>] [n<sup>d</sup>] [ŋ<sup>g</sup>] and [ŋ<sup>g<sup>w</sup></sup>], strongly when they occur in intervocalic position and almost imperceptibly when they occur in initial position (in citation forms, and, in discourse, following strong junctures; since all Kwaio morphemes have final vowels, these consonants are prenasalised when they occur within phrases).

Further phonological notes are needed. First, *f* is for many speakers a voiceless bilabial spirant, [ɸ]; *k* (and less pervasively, *k<sup>w</sup>*) are very commonly spirantised as [x] and [x<sup>w</sup>]; although these represent free variations, this spirantisation of the *k* phoneme can be taken as characteristic of Kwaio among Malaitan languages. Finally, the phoneme /l/ has two allophones in complementary distribution, the flap [ɾ] preceding high vowels ([ɾi] and [ɾu]) and [l] preceding [a e o].

Historically speaking, patterns of sound correspondence with neighbouring languages are rendered somewhat complex by common alternations of *d* and *g* (sometimes Kwaio manifests both forms, as in *duidui* and *guigui* 'vinegar ant'), by the historical coalescence of three historically separate phonemes (what in the northern languages are /l/, /r/, and a phoneme variously realised as [θ], [h], [s]) and the variable manifestations of forms according to the pattern of [l/ɾ] complementary distribution described above. Further complications result from the still active process of word tabooing.

We have described in detail (Keesing – Fifi'i 1968) the sociolinguistic and linguistic aspects of word tabooing, a matter of considerable comparative interest in Austronesian studies. Suffice it to say here that lexical forms represented in the name of an important man may be tabooed from secular use if after his death the man rises to power as an ancestral spirit (*adalo*). An ancestor, immediate or remote, is given a pseudonym (a *fo<sup>o</sup>ota* or 'offering' name) which is used for pigs consecrated to the ancestor; and in the case of an *adalo* who rises to prominence and is accorded power, it serves to replace the name used in life in most contexts. The *fo<sup>o</sup>ota* name usually encapsulates some incident in the life of, or characteristic of, the ancestor (hence is likely to contain a commonly used lexical form). If this ancestor is accorded

sufficient power, the lexical item in the *foʔota* name (either in all contexts or in the particular combination used in the name) may also be tabooed.

These taboos apply to descendants of the ancestor in question, but others using a locally tabooed form in the presence of a descendant are liable for compensation. Some *adalo* are so widely propitiated through an entire area that the taboo applies generally in the area. A consequence of word tabooing is that replacement forms must be coined. In some cases, a minor phonological variant of the tabooed form is coined; in context, it will be quite transparent to native speakers (e.g. *kaakaoʔa* ‘white’, locally replacing *kʷaakʷaoʔa* for some speakers). However, some such forms are either borrowed from neighbouring languages or otherwise depart from expectable sound shifts. For some lexical items, there are three or even five phonological alternants in widespread use. In some cases the tabooed forms are pervasive and otherwise very stable Oceanic/Austronesian forms (e.g. *manu* ‘bird’ has been replaced by *lanasi* in Kwaio) and/or items on standard lexicostatistic lists. In some cases, the replacement forms come from Solomon Islands Pijin, hence ultimately from English: *laiso* (from English ‘rice’) has replaced *kai* as the generic term for yam (resulting in the oddity that Kwaio speakers distinguish between *laisi toʔofuŋaʔa*, ‘real rice’, i.e. yams, and *laisi naa faka* ‘important rice’) and *leni* (‘rain’) has replaced *neʔu* for many speakers.

The consequences of this word tabooing for comparative linguistics are, briefly:

- (1) that cognate frequencies in lexicostatistic comparison are somewhat lower than they otherwise would be;
- (2) that Kwaio speakers have a substantial passive vocabulary of forms they know but cannot use (speakers of the dialect described here know and recognise forms such as *duŋa* ‘fire’ and *madama* ‘moon’ used in the Kwareuna dialect, but cannot use them);
- (3) that expectable sound correspondences are often disrupted, with Kwaio manifesting either irregularities or patterns found in neighbouring languages.

Kwaio as used 50 years ago had two interesting sets of specialised usages, one of which has effectively disappeared, and the other of which survives only among knowledgeable pagan traditionalists. The first is a register, known as *fatamalemale*, traditionally used between couples in the course of customary courtship. On chaste rendezvous in the forest, one or more couples would use a special lexicon, particularly to refer to the small presents

(areca nuts, tobacco) they exchanged and arrangement of further meetings. Only a few older people remember some of the special lexical items.

The second special set of usages, called *alafuu to'oria*, was widely used in magical spells, ritual conversation with the ancestors, epic chants, and some other formal contexts (e.g. stylised curses or challenges). It consisted of standardised euphemistic references, usually based on metaphoric imagery or metonymy. Typical *alafuu to'oria* usages are references to the destruction of another group and its settlement in terms of “fence breaking” or “taro stomping” and such conventional sayings as “the hard-undershelled turtle surfaces on the reef, the soft-undershelled turtle surfaces in the open sea” (i.e. if you don't have strong backing, keep quiet).

Although such special registers are vanishing with the contexts in which they were used, Kwaio retains its primacy within a substantial speech community and its linguistic integrity in the face of Pijin (and other) influences. Embodying, as all languages do, a rich historical cultural tradition, Kwaio is suffering lexical erosion with the gradual Westernisation and Christianisation of its speakers. Many forms relating to ritual and magic, and to the rain forest environment, are disappearing in the Christian coastal villages and survive only among the embattled pagans in the mountains. Among these coastal (and urban) Christians, mannerisms from neighbouring languages and Pijin loan words are increasingly pervasive. Much of the rich cultural tradition encoded in the speech of the pagan traditionalists is represented in the forthcoming, greatly revised, edition of my Kwaio dictionary.

### 3. Kwaio syntax

Kwaio manifests very clearly a number of grammatical patterns and features whose historical origins have been of interest to specialists: a pronominal system where pronouns fully marked for person and number are obligatory constituents of verb phrases, referencing subjects and (in transitive constructions) objects (and where subject and object NPs are optional expansions on this VP nucleus); use of the two transitive suffixes reconstructed for POC; extensive use of serial verbs and other compound verb constructions; the existence of a substantial set of prepositions manifesting the morphology of transitive verbs and historically apparently derived from the second verbs in compound constructions; and extensive and productive use of numerical classifiers. As is reconstructed for POC, Kwaio verbs consist of statives (a subset of which can modify nouns directly as adjectives), a small class of obligatory intransitives, a large class of optional

transitives (marked as such either within a clitic object pronoun or a transitive suffix + clitic), and a very small class of obligatory transitive verbs. Reflexes of the causative prefix and “reciprocal” prefix reconstructed for POC are highly productive. So too are formative processes (in many cases, using morphemes reconstructed for POC) that convert active verbs to statives, form abstract verbal nouns, nominalise verbs, etc. The preferred order of constituents is SVO; fronting of object NPs (objects of transitive verbs and prepositions) is common. Since VPs contain subject referencing pronouns fully marked for person and number, where a subject NP precedes the VP (and where the former has either a noun or a free pronoun as its head) this subject reference is echoed by the following pronoun within the VP. To Oceanic specialists, Kwaio hold few grammatical surprises. Keesing (1985) provides both a fairly detailed grammatical description and extensive texts.

## 58. Raga

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>D. S. Walsh</i>
---

---

---

### 1. Introduction

---

---

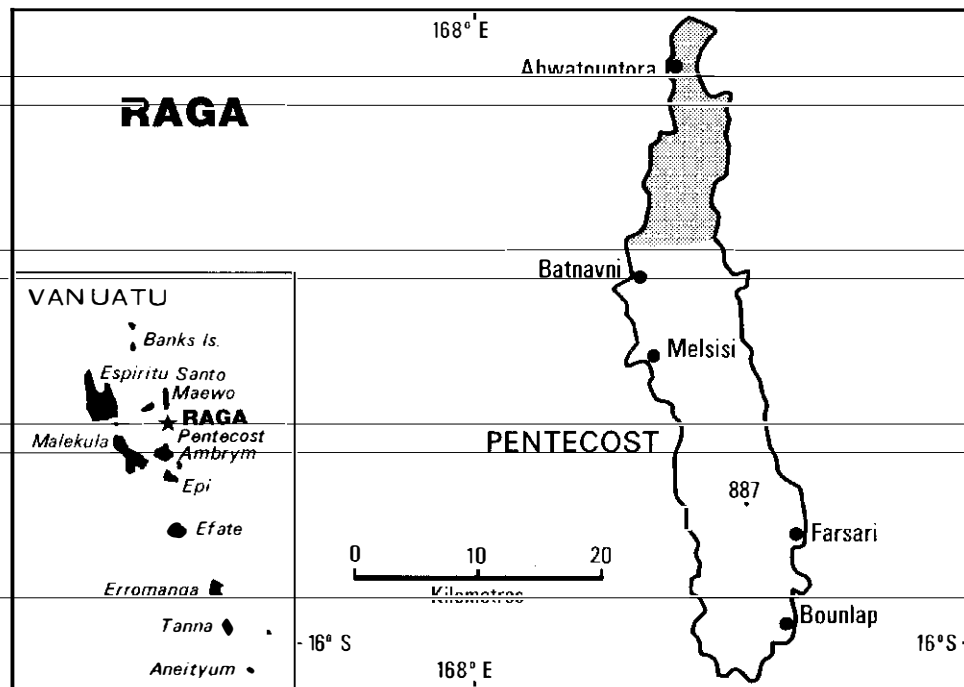

Place and language names are here cited as they usually appear in the literature and on the maps, i.e. in an orthography that, because it is not fully phonemic, is often phonologically misleading; in which case, after the first citation only, they are also cited within round brackets in the phonemic orthography that is used for the examples in this description.

Raga is spoken in the northern third of Pentecost Island, Vanuatu (formerly the New Hebrides), with the southern boundary of the language running roughly from Namaram on the west coast to Aliyu (Aliyu) on the east coast. It is also spoken in southern Maewo by a small population of relatively recent immigrants from neighbouring North Pentecost. There are altogether about 4000 speakers of the language, including some who live more or less permanently in the national capital, Port Vila, on the island of Efate. Dialectal differences are minimal compared with those found in other Vanuatu languages that are spoken by similar numbers of speakers.

The language was first transcribed by Bishop Patteson in the 1860s, and his two galley-slips of words and sentences were the source for the numerals and short wordlist in Gabelentz (1879). Thomas Ulgau, a native of Mota, in the Banks Islands to the north, whose first language, Mota, was for many years the lingua franca of the Melanesian Mission, came to Pentecost in 1878 as a mission teacher, and in 1882 his translation of the Book of Common Prayer, *Tataro gaha avoana ata Raga* (Tataro γaha avoana ata Raya), was printed at the Mission Press on Norfolk Island. Between 1902 and 1953 about 18 Raga translations of various biblical and liturgical materials (see Walsh 1966: 81-82) were published by the Melanesian Mission Press, based initially on Norfolk Island but later transferred to Guadalcanal, and eventually Taroaniara, in the Solomon Islands. 1970 saw the publication at Taroaniara of the most idiomatic Raga liturgical translation to date – the enlarged Prayer Book, *Book Tataro la avoan ata Raga* (Raya). As yet very little original Raga text has been published, other than that in Ivens (1938) and Walsh – Lini (Lini) (1981).

---

---

Map 58. Raga language area

The first description of Raga was Codrington's brief grammar (1885), based principally upon the output of speakers of the language who were at the Melanesian Mission's clerical training establishment on Norfolk Island, although extant liturgical material was also taken into account. Ivens' (1938) description of Lamalanga (Lamalaŋa) grammar, i.e. Raga grammar, is largely based on, and limited by, a corpus of translated biblical and liturgical material. More recent descriptive and comparative work on the language has been done by Walsh (1962, 1966, 1978a, 1978b, 1978c, 1980, 1982a, 1982b, 1986, 1990), and a *Grammar and dictionary* by Walsh – Leona is in preparation.

Raga is a member of the North-Central Vanuatu subgroup of Oceanic languages as defined by Tryon (1976), a subgroup which includes all the languages of north-east Vanuatu, and which is itself a member of the Remote Oceanic subgrouping within Central-Eastern Oceanic (see Tryon's Figure 7, p. 27 of this volume).

## 2. Phonology

The segmental phonemes whose values are summarised below are more fully described in Walsh (1962, 1966, 1982a, and 1982b).

Table 1. Consonants

	Labialised labial	Labial	Alveolar	Velar	Glottal
Stops	vɭ		t	k	
	vd	b <sup>w</sup>	b	d	g
Fricatives	vɮ		s		h <sup>1</sup>
	vd	v <sup>w</sup>	v	ɣ	
Nasals		m <sup>w</sup>	m	n	ŋ
Laterals			l		
Flaps			r		
Semivowels		w			

After Nasal + Vowel (+ Vowel) the bilabial stops /b/ and /b<sup>w</sup>/ and the alveolar stop /d/ are prenasalised. /b/ may be voiced or voiceless, but when prenasalised it is always voiced. The voiced velar stop /g/ is prenasalised. The labial components of /v/ and /v<sup>w</sup>/ are labio-dental; those of /b/, /b<sup>w</sup>/, /m/, /m<sup>w</sup>/ are bilabial. The fricatives /v/, /v<sup>w</sup>/ and /ɣ/ may be voiced or voiceless.

Table 2. Vowels

	Front	Central	Back
High	i		u
Mid	e		o
Low		a	

### 3. Morphosyntax

#### a) Personal pronouns

The principal pronominal forms for Raga are as follows:

1. In fact pharyngeal rather than glottal.

Table 3. Pronominal

	Focal	Subject	Object	Possessive
I	<i>inau</i>	<i>na-</i>	<i>-au ~ -u</i>	<i>-ku ~ -gu ~ -k</i>
You	<i>yigo</i>	<i>yo-</i>	<i>-yo</i>	<i>-m<sup>wa</sup> ~ -m</i>
He, she, it	<i>kea</i>	<i>∅ ~ ye-</i>	<i>-a ~ -e</i>	<i>-na ~ -n</i>
We dl incl	<i>yidaru</i>	<i>ta-ru</i>	<i>yidaru</i>	<i>-daru</i>
We pl incl	<i>yida</i>	<i>ta-</i>	<i>yida</i>	<i>-da</i>
We dl excl	<i>kamaru</i>	<i>ya-ru</i>	<i>kamaru</i>	<i>-maru</i>
We pl excl	<i>kamai</i>	<i>ya-</i>	<i>kamai</i>	<i>-mai</i>
You dl	<i>kimiru</i>	<i>yi-ru</i>	<i>kimiru</i>	<i>-miru</i>
You pl	<i>kimiu</i>	<i>yi-</i>	<i>kimiu</i>	<i>-miu</i>
They dl	–	<i>ra-ru</i>	–	–
They pl	<i>kera</i>	<i>ra-</i>	<i>-ra</i>	<i>-ra</i>

- i) Some trial forms exist, but are currently falling into disuse.
- ii) Bound subject forms are prefixed to tense/aspect particles, bound object forms are suffixed to verbs and to some directional particles, and possessive forms are suffixed either to nouns or to possession class markers.
- iii) For discussion of possible historical implications of the incidence of /k/ and /y/ in these forms see Walsh (1982a).

#### b) Nouns

In general nouns have referents which can be possessed. Five classes of possession are distinguished as follows:

- i) Possession of food which is for eating (rather than, e.g., selling) by the possessor. This class is marked by *ya-* + suffixed possessive personal pronoun form or suffixed *-n* ‘belonging to’, e.g. *ya-ku damu* ‘my yam (for me to eat)’, *damu ya-n Pita* ‘yam belonging to Peter (for him to eat)’. Note also *ya-ku na damu* lit. ‘mine the yam’, i.e. ‘the yam is mine (for me to eat)’.
- ii) Possession of liquid which is for drinking (rather than, e.g., washing) by possessor. This class is marked by *ma-* + suffixed possessive personal pronoun form or suffixed *-n* ‘belonging to’, e.g. *ma-ra wai* ‘their water (for them to drink)’, *wai ma-n vavine yea* ‘water belonging to that woman (for her to drink)’. Note also *ma-ra na wai* lit. ‘theirs the water’, i.e. ‘the water is theirs (for them to drink)’.

- iii) Possession of certain kinds of valued object, e.g. garden land, crops, articles of personal decoration, and, in some contexts, pigs. This class is marked by *bila-* + suffixed possessive personal pronoun form or suffixed *-n* ‘belonging to’, e.g. *bila-na boe* or *bila-n boe* ‘his/her pig’, *boe bila-n Pita* ‘pig belonging to Peter’. Note also *bila-m<sup>wa</sup> na boe* lit. ‘yours the pig’, i.e. ‘the pig is yours’.
- iv) Possession in which the possessor is “subordinate” to the thing possessed. This class includes most body parts, most kin, the house or village to which a person belongs, canoes, sleeping-mats, etc. It is marked by suffixation to the possessed noun of either a possessive personal pronoun form or *-n* ‘belonging to’, e.g. *tama-gu* ‘my father’, *ebe-ku* ‘my sleeping-mat’, *ratahi-n Pita* ‘mother belonging to Peter’.
- v) Possession, other than of types i-iii, in which the possessor is “dominant” over the thing possessed. This large possession class is marked by *no-* + suffixed possessive personal pronoun form or suffixed *-n* ‘belonging to’, e.g. *no-gu damu* ‘my yam (for me to sell, etc., rather than for me to eat)’, *wai no-n Pita* ‘water belonging to Peter (for him to use for purposes other than drinking)’. Note also *no-gu na bua* lit. ‘mine the knife’, i.e. ‘the knife is mine’.

### c) Noun phrase functional elements

The functional elements that can occur before the noun within a noun phrase are as follows:

- i) The possession class marker + possessive personal pronoun combinations, or + *-n* ‘belonging to’, as described in b) i-iii) and v) above.
- ii) The nominal article *na*.
- iii) The paradigmatic set *la* ‘at’, *lol* ‘in’, *lalai* ‘to (dative)’, *yin* ‘with (instrumental)’, and *yi* ‘for/as (purposive)’.
- iv) The paradigmatic set *vai* ‘to/towards’, and *ata* ‘from/belonging to (a place, village or island)’.
- v) The paradigmatic set *mai* ‘with (associative)’, *huri* ‘about/concerning’, and *nin* ‘from/out of’.
- vi) The plural marker *ira*, which can occur only with members of a closed subset of nouns that have human referents, such as *vavine* ‘woman’, *atam<sup>wani</sup>* ‘man’, *atatu* ‘person’, and *tuturani* ‘European person’.

The only functional elements that can occur after the noun within the noun phrase are:

- i) The suffixed possessive personal pronoun forms, or *-n* ‘belonging to’, as described in b) iv) above.
- ii) The relative forms *yeki* ~ *yek* ‘this’, and *yea* ‘that’.

#### d) Adjectives

An adjective occurs after the noun which it modifies, e.g. *rae wasi* lit. ‘forehead strong/hard’, and the usual pattern is noun + one adjective, so that when two adjectives are to be applied to a given noun the construction is noun + first adjective, noun + second adjective. In addition to words which function only as adjectives, such as *meto* ‘black’, many words can function either as nouns or as adjectives, e.g. *tagure* ‘sago palm’, *im<sup>w</sup>a tagure* lit. ‘house thatched with sago palm fronds’.

#### e) Numerals

The fundamental units of the ten-based number system, in their cardinal forms, are: *yai-tuv<sup>w</sup>a* ‘one’, (*yai-rua* ‘two’, (*yai-tolu* ‘three’, (*yai-vasi* ‘four’, (*yai-lima* ‘five’, (*yai-ono* ‘six’, (*yai-bitu* ‘seven’, (*yai-v<sup>w</sup>clu* ‘eight’, (*yai-sivo* ‘nine’, and *haŋvulu* ‘ten’. For the remainder of the “one-ten decade” the form for ‘ten’ is *haŋvul*, as in *haŋvul dom<sup>w</sup>an yai-tuv<sup>w</sup>a* ‘eleven’, *haŋvul dom<sup>w</sup>an yai-rua* ‘twelve’, etc. In the decades from 20 to 90 the form for ‘ten’ is *ŋavul*, as in *ŋavul yai-rua* ‘20’, *ŋavul yai-tolu dom<sup>w</sup>an yai-vasi* ‘34’, etc. For ‘hundred’ the form is *vudolua*, with ‘200’ being *vudolua va-rua*, where *va-* is the multiplicative prefix—*va-rua* ‘twice’, *va-tolu* ‘thrice’, etc. In numbers over 100 the ligature *vena* is used, as in *vudola va-tuv<sup>w</sup>a vena ŋavul yai-tolu dom<sup>w</sup>an yai-tolu* ‘133’. The ordinal suffix is *-na*, as in *yai-rua-na* ‘second’, *yai-tolu-na* ‘third’, etc.

#### f) Locational words

There are three groups of words which refer to location, either in space or in time:

- i) An open group of place names, all of which may be preceded directly by any of *vai* ‘towards’, *ata* ‘from/belonging to’, *nin* ‘from/out of’, e.g. *vai Lamalaja* ‘towards Lamalaja’, *atatu ata B<sup>w</sup>atnapni* ‘person belonging to B<sup>w</sup>atnapni’, *nin Ab<sup>w</sup>atuntora* ‘from Ab<sup>w</sup>atuntora’.
- ii) A group of words with spatial or temporal reference, including *antahi* ‘shore’, *anvanua* ‘village’, *batenhano* ‘when’, *yariyi* ‘today’, *noŋoiha* ‘non-present time’, *teti* ‘here’, *aia* ‘there’, *kahaga* ‘yonder’, *amare* ‘above/upwards’, *amua* ‘before/in front of’, *atā* ‘below/downwards’, etc., all of which may be preceded directly by *vai* ‘towards’.

- iii) A group of bound forms with spatial reference, or, in one case spatial or temporal reference, including *atayu-* ‘after/behind (ref. space or time)’, *abe-* ‘near’, *alolo-* ‘inside’, *alu-* ‘on top of’, *ate-* ‘under/underneath’, etc., all of which must occur with a suffixed possessive personal pronoun form or *-n* ‘belonging to’, e.g. *abe-na* ‘near him/her/it’, *alolo-n im<sup>w</sup>a* ‘inside (the) house’.

### g) Verbs

Verb forms are compatible with the tense/aspect markers, and some verbs are compatible with various modifying affixes. The basic form of a verb is here taken to be that which can occur in isolation as an imperative.

- i) The basic tense/aspect markers are suffixed or infixes to subject personal pronouns as follows:

*-mu-* ~ *-m-* ~ *-m<sup>w</sup>a* ~  $\emptyset$  ~ *-m* ‘action in progress (time unspecified)’, where *-mu-* occurs only before *-ru* ‘dual number for subject personal pronoun’, e.g. *ra-mu-ru hae* ‘they (dl) go up’; *-m-* occurs only before *-dol* ‘trial number for subject personal pronoun’, e.g. *ra-m-dol hae* ‘they (trial) go up’; *-m<sup>w</sup>a* occurs only after the zero allomorph of the 3rd singular subject personal pronoun, e.g.  $\emptyset$ -*m<sup>w</sup>a hae* ‘he/she/it goes up’;  $\emptyset$  occurs only before /b/ or /b<sup>w</sup>/, e.g. *ra- $\emptyset$  ban(o)* ‘they go’, *na- $\emptyset$  b<sup>w</sup>eru-a* [na<sup>m</sup>b<sup>w</sup>eru-a] ‘I bend it’; and *-m* occurs in all other contexts, including after the *ye-* allomorph of the 3rd singular subject personal pronoun which is found only after *bere* ‘lest’, e.g. *ra-m hae* ‘they go up’, *bere ye-m hae* ‘lest he/she/it go up’.

$\emptyset$  ~ *-nu* ~ *-n* ‘completed action (past time)’, where  $\emptyset$  occurs only before *-ru* ‘dual number for subject personal pronoun’ and *-tol* ‘trial number for subject personal pronoun’, e.g. *ra- $\emptyset$ -ru hae* ‘they (dl) went up’ and *ra- $\emptyset$ -tol hae* ‘they (trial) went up’; *-nu* occurs only after the zero allomorph of the 3rd singular subject personal pronoun, e.g.  $\emptyset$ -*nu hae* ‘he/she/it went up’; and *-n* occurs in all other contexts, e.g. *na-n hae* ‘I went up’.

*-vi* ~ *-i* ~ *-v* ‘future action’, where *-vi* occurs only after the zero allomorph of the 3rd singular subject personal pronoun, e.g.  $\emptyset$ -*vi hae* ‘he/she/it will go up’, and after dual or trial subject personal pronouns, e.g. *ra-ru vi hae* ‘they (dl) will go up’ and *ra-tol vi hae* ‘they (trial) will go up’; *-i* occurs only before /v/ or /v<sup>w</sup>/, e.g. *na-i van(o)* ‘I will go’ and *na-i v<sup>w</sup>ariri-a* ‘I will drill it’; and *-v* occurs in all other contexts, e.g. *na-v hae* ‘I will go up’.

*-si* ~ *-s* ‘conditional action’, where *-si* occurs only after the zero allomorph of the 3rd singular personal pronoun, e.g.  $\emptyset$ -*si hae* ‘if he/she/it goes up’, and after dual or trial subject personal pronouns, e.g. *raru si hae* ‘if they (dl) go up’ and *ra-tol si hae* ‘if they (trial) go up’; and *-s* occurs in all other contexts, e.g. *na-s hae* ‘if I go up’.

*-men* ‘desiderative action’, which can occur after any subject personal pronoun, e.g. *na-men hae* ‘I should go up’, *ra-ru men hae* ‘they (dl) should go up’.

ii) The principal verbal prefixes, compatible with some verbs only, are:

*va-* ~ *ba-* ‘causative’, e.g. *mate* ‘die’ can become *va-mate* ~ *ba-mate* ‘cause to die’, i.e. ‘kill’. For the conditions of this morphophonemic variation see v) below.

*vi-* ~ *bi-* ‘reciprocal’, which has been found only with some reduplicated verb forms, e.g. *vi-luslusi* ~ *bi-luslusi* ‘compete (with each other), from *lusi* ‘drive off/away’. For the conditions of this morphophonemic variation see v) below.

iii) The principal verbal suffixes, compatible with some verbs only, are:

*-ana* ~ *-na*<sub>1</sub> ‘noun transformative’, where *-na* occurs only after verb-final *a*, e.g. *no-ra hala-na* ‘their raising arms sideways while dancing’, from *hala* ‘raise arms sideways in custom dance’; and *-ana* occurs in all other contexts, e.g. *mate-ana* ‘death’, from *mate* ‘die’.

*-ana* ~ *-na*<sub>2</sub> ‘passive transformative’, where *-na* occurs only after verb-final *a*, e.g.  $\emptyset$ -*nu yita-na na vavine* lit. ‘was seen the woman’ i.e. ‘the woman was seen’; and *-ana* occurs in all other contexts, e.g.  $\emptyset$ -*vi yani-ana na damu* lit. ‘was eaten the yam’ i.e. ‘the yam was eaten’. This suffix is found only in constructions of the following shape: zero allomorph of 3rd singular subject personal pronoun + tense/aspect marker + verb + passive transformative, with all of this either preceded or followed by *na* + subject, e.g. *na damu  $\emptyset$ -vi yani-ana* or  *$\emptyset$ -vi yani-ana na damu*.

*-i* ‘transitive transformative’, which can make an intransitive verb compatible in some cases with a direct object, e.g. *laŋi  $\emptyset$ -m* <sup>w</sup>*a here* ‘(the) wind blows’ and *laŋi  $\emptyset$ -m* <sup>w</sup>*a here-i ilu-na* ‘(the) wind blows his hair’, and in other cases with an indirect object, e.g. *na-m ate* ‘I look/glance’ and *na-m ate-i no-gu bua* ‘I look for my knife’. After *-i* a ligature *-ni-* is required before all suffixed object personal pronouns, ref. a) above, except *-au*, e.g. *yo-m ate-i-au* ‘you look for me’, but *na-m ate-i-ni- $\gamma$ o* ‘I

look for you', *na-m ate-i-ni-a* 'I look for him/her/it', *na-m ate-i-ni-ra* 'I look for them', and *laji Ø-m<sup>w</sup>a here-i-ni-a* '(the) wind blows it'.

-*va* 'noun transformative', e.g. *maturu-va* 'sleep (n)' from *maturu* 'sleep (vb)' and *yita-va* 'expectation (i.e. what one predicts from what one sees)' from *yita ~ gita* 'see'. This suffix is compatible with a relatively small number of verbs.

- iv) Reduplication, either total or partial, is found for many verbs, and usually signifies that the action is repeated, frequentative, or habitual, e.g. *harahara* 'collect often or habitually/harvest a garden crop totally' from *hara* 'collect/gather', *ra-Ø-banvano* 'they go often or habitually', from *vano ~ bano* 'go'.
- v) Morphophonemic variation of verb-initial consonants occurs as follows: verbs which in their basic form have initial *v*, *v<sup>w</sup>*, *t* or *y* will have initial *b*, *b<sup>w</sup>*, *d* or *g* respectively when preceded by subject personal pronoun + 'action in progress' marker, e.g. *ra-n van(o)* 'they went', but *ra-Ø ban(o)* 'they go'; when preceded by any tense/aspect marker + *mom* 'still/yet', e.g. *ra-n van(o)* 'they went', but *ra-n mom ban(o)* 'they still went' and *ra-n hav mom ban(o) tehe* 'they did not still go'; and when preceded by 'action in progress' marker-governed verb + *ba* 'verbal ligature', e.g. *ra-m domare ba bano* 'they arise and go'. This rule applies not only to basic verb forms, but also to any derivatives that have initial *v*, *v<sup>w</sup>*, *t* or *y* in their isolable form, viz. wholly or partly reduplicated verbs, e.g. *vanvano ~ banvano* 'go often/habitually'; causative prefix + verb, e.g. *va-mate ~ ba-mate* 'kill'; reciprocal prefix + verb, e.g. *vi-luslusi ~ bi-luslusi* 'compete (with each other)'; and to verb (simple or derived) + any of the verbal suffixes listed above except the noun transformatives -*ana* ~ -*na*<sub>1</sub> and -*va*.
- vi) Some forms can function unchanged as either verbs or nouns, e.g. *ra-n vayahi* 'they taught', *ra-Ø bayahi* 'they teach', *no-ra vayahi* 'their teacher'.
- vii) Some nouns can be transformed into verbs (usually of 'being' or 'becoming') by the suffix -*ya* 'verb transformative', e.g. *bili* 'mud' and *bili-ya* 'become muddy'; *beu* 'weak person' and *beu-ya* 'be weak'.
- viii) Adverbs occur after intransitive verb forms, e.g. *ra-Ø ban vilvilehi* 'they go quickly', or after the objects of transitive verbs, e.g. *yo-n tutui-ni-a vilvilehi* 'you struck him quickly'.

## h) Negation

Negative verbal constructions can be formed by the use of *hav...te(he)* as follows: *yo-n van(o)* 'you went', *yo-n hav van(o) te(he)* 'you did not go'; *yo-m loli-a* 'you are doing it', *yo-m hav loli-a te(he)* 'you are not doing it'. Emphatic negation can be conveyed by using *borabe*, e.g. *borabe Ø-vi vano* 'he/she/it will *not* go', *borabe kun keki* '*not* like this'. The general negative *siyai* 'no' can be used alone in response to a question, and also in statements, e.g. *damu siyai* '(there is) no yam'. *Siyai* can also function as a verb, e.g. ... *take Ø-m<sup>wa</sup> siyai* '... but it is not happening'.

## i) Questions

Questions can be asked by using a rising final intonation in what would otherwise be a statement, or by using an interrogative form such as *i-hei* 'who? (sg)', *ira-hei* 'who? (pl)', *hano* 'what?', *behe ~ hala-behe* 'where?', *bate-n-hano* 'when?', e.g. *i-hei Ø-nu mai* 'who (sg) came?', *yo-m lol hano* 'you do what?', *no-gu bua behe* 'my knife (is) where?', *bate-n-hano yo-v lai-a* 'when will you get it?'

## j) Clause and sentence structure

The predominant ordering within verbal clauses and single-clause sentences is SV(O), but with passive verb forms the ordering may be either SV or VS as shown in g) iii) above. Verbal clauses and single-clause sentences with non-imperative active verbs have the following general shape: ± focus subject (noun, noun phrase, focus personal pronoun, personal name) + subject personal pronoun + tense/aspect marker + verb ± object (noun, noun phrase, object personal pronoun, personal name).

Clauses and single-clause sentences without verbs occur frequently, e.g. *kea beu* 'he/she (is a) weak person'; *ya-ku na damu yeki* lit. 'for eating-mine yam this', i.e. 'this yam (is) mine to eat'; *ebe-na behe* lit. 'sleeping-mat his/her where?', i.e. 'where (is) his/her sleeping-mat?'. These verbless sentences are usually semantically broadly equivalent to corresponding English copula-verb sentences.

Within complex sentences, clauses are articulated by various conjunctive and relational words, e.g. *bere* 'lest', *ta ~ take* 'but', *i ~ i-ke* 'and', etc., whose distributional compatibilities are beyond the scope of this brief description.

## 59. Paamese

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Terry Crowley</i>
--

---

---

### 1. Introduction

---

Paamese is spoken on the island of Paama in the Republic of Vanuatu, which is located in the southwest Pacific between Fiji and New Caledonia. There are probably about 4000 speakers of the language altogether, including the considerable numbers of people now resident in the towns of Vila and Santo, as well as on plantations on other islands in the country. Until 1961, Paamese was also spoken on the neighbouring island of Lopevi, but after the volcano on the island erupted, the population moved permanently to Ngala, on the island of Epi to the south.

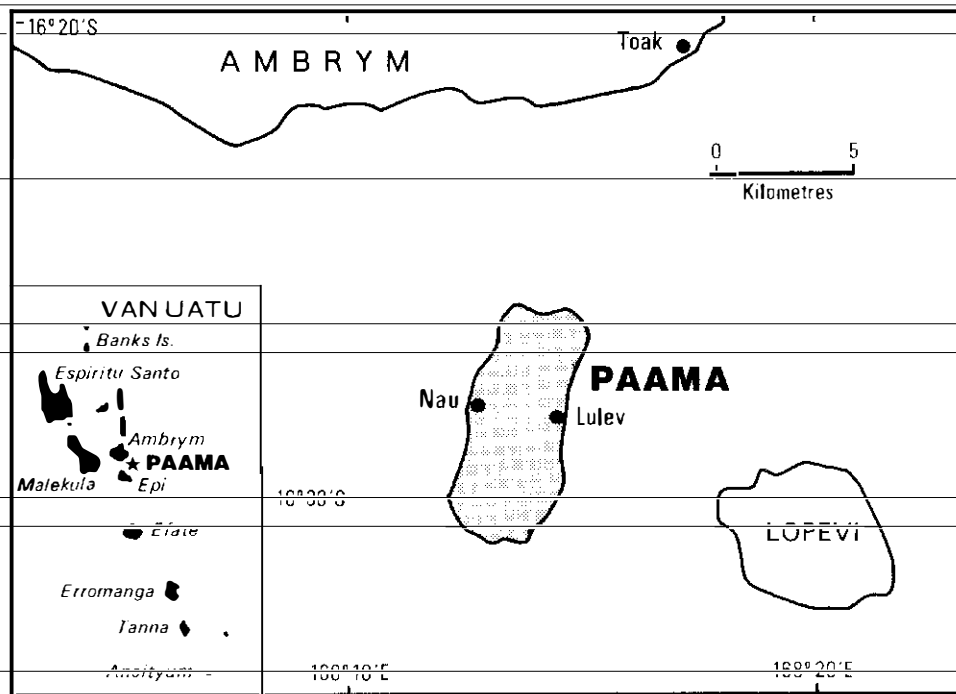

Although Paama is a small island, only about ten kilometres long, and less than five kilometres wide, it is nevertheless not linguistically homogeneous. The most noticeable dialect division is between the north and the south, with the villages of Nau and Lulev representing the southernmost villages speaking northern varieties of Paamese. The original dialect of Lopevi is closer to the northern rather than the southern dialect of Paamese. There are relatively few lexical differences between these dialects, especially in the area of core vocabulary, but there are systematic phonological correspondences between the two areas which make speakers of either dialect immediately recognisable. The major differences involve the northern diphthongs *ei* and *ou*, which correspond to the southern diphthongs *ai* and *au*. The phoneme /l/ is retained intact in the south, while in the north it has been lost, or has shifted to /i/ in many environments. Further details of the nature of dialect differences are included in the dictionary of Paamese that is currently being prepared by the author. Entries in this dictionary are taken from the southern variety of the language, which was the form of the language that was taken as the basis of the grammatical description in Crowley (1982).

The grammar of Paamese has been described in Crowley (1982). The only other published grammatical information on Paamese is the short sketch by Ray (1926: 311-329). Details on the development of transitivity marking are described in Crowley (1983) and serial verb constructions in Crowley

---

(1987). Crowley (to appear) describes in detail the grammar and semantics of inalienable possession.

Textual material in Paamese (with free English translations) has been published as Crowley (1980), while Mael and Crowley (1984) is a collection of stories published in Paamese only. There are some religious materials that have been translated into Paamese. These are now all out of print and are generally not easily available to speakers of Paamese. Moreover, the quality of the translations is generally not high, which has meant that speakers find great difficulty in reading them.

Map 59. Paamese language area

The data for this comparative wordlist have been collected by the author over an extended period beginning in 1976. Initially, for extended periods between 1976 and 1978, I was studying as a doctoral student at the Australian National University, residing on Paama. Since 1983, I have been resident in Vila, where I have had considerable ongoing contact with members of the Paamese community.

Along with speakers of other Vanuatu vernaculars, the Paamese use the English-lexifier pidgin known as Bislama as their major internal lingua franca. This language is the source for many borrowed items, especially those relating to introduced technological and cultural items.

## 2. Phonology

### 2.1 Inventory of consonants

The consonant inventory for southern Paamese consists of the following:

*Table 1. Consonants*

		Labial	Apical/laminal	Velar	Glottal
Stops	v l	<i>p</i>	<i>t</i>	<i>k</i>	
	v d	<i>b</i>	<i>d</i>	<i>g</i>	
Fricatives		<i>v</i>	<i>s</i>		<i>h</i>
Nasals		<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels		<i>w</i>	<i>y</i>		

In addition, the northern dialects also make a contrast between the ordinary labials *m* and *v*, and labialised labials *m<sup>w</sup>* and *v<sup>w</sup>*, which are represented in the Paamese orthography as *m̃* and *ṽ*. There are no such stops in the southern dialect, however.

The only consonant to exhibit any major degree of allophonic variation is the labial fricative. This generally occurs as voiceless [f] word initially and as voiced [v] intervocalically. Word finally, the opposition between *v* and *p* is neutralised, with the labial obstruent archiphoneme being realised as [f] or [p] in free variation.

It should be noted that *b*, *d* and *g* in southern Paamese are always voiced and prenasalised. These stops have a much more restricted distribution in the north, where most examples of earlier *b* have shifted to *v* and most *d* have shifted to *r*. The phoneme *g* does not occur at all in the north, and all instances of this in the south correspond to *k* in the north.

### 2.2 Inventory of vowels

Paamese has a five-vowel system, with distinctions between front and back, and high, mid and low, i.e.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Vowels undergo relatively little allophonic variation. There is also a surface contrast between long and short vowels (see below 2.3).

### 2.3 Underlying and surface forms

The surface phonology of Paamese presents many examples of morphophonological alternations which are best accounted for by positing underlying forms which differ in many respects from surface forms. A detailed description of these underlying forms, and the rules needed to link these with surface forms, and their justification, is presented in Crowley (1982: 20-47). In summary, underlying geminate vowels in non-final position are realised on the surface as long vowels non-finally and as short vowels word finally. Underlying single vowels are realised as short vowels non-finally, while in word final position, these are generally lost.

All forms in the wordlist are entered in their surface rather than underlying forms.

Stress is unpredictable at the surface level, but if we consider that stress is assigned to underlying forms, then Paamese, with a few exceptions, can be described as having antepenultimate stress.

## 3. Grammar

Paamese is typologically fairly typical of island Melanesian languages. It is SVO in basic word order, with a fairly rich set of mood prefixes on verbs which vary for a 15-category set of pronominal forms, in which there are distinctions between singular, dual, paucal and plural numbers, as well as an inclusive/exclusive distinction in first person non-singular categories. Along with many other languages of the North-Central Vanuatu subgroup, Paamese verbs undergo root-initial modification depending on the category of the preceding grammatical marker. There is limited verbal suffixation, but transitive verbs with singular pronominal objects normally express these by means of a suffix rather than a free form pronoun.

All verbs are presented in their third person singular realis subject form, which involves a zero suffix, but with many verbs appearing in a derived root form. Transitive verbs in the wordlist occur in their third person singular objective form.

Nominal morphology is much less complex, though inalienable possession is expressed by means of direct pronominal suffixation. In the wordlist, such nouns are presented with a third person singular suffix, as most cannot normally occur in their bare root forms.

## 60. Lewo

**Contributor:**

Introduction and Wordlist : *Robert Early*

### 1. Introduction

Lewo is spoken in the north and east of Epi Island, in the Republic of Vanuatu in the south-western region of the Pacific Ocean. The main villages where the language is spoken are Moriu, Nivenue, Nikaura, Nuvi, Lokopui, and Mate, as well as some communities on the north-east of the island to which speakers have migrated, such as Alak and Malvasi. Dialectal variation occurs between these villages, and is also found within them where the modern village comprises remnants of several older villages that came together subsequent to the severe depopulation that occurred late last century and up until the 1930s. The variation includes some items of core vocabulary, as well as key morphological features such as possessive pronoun paradigms and the negative construction. The total number of speakers approximates 750.

Map 60. Lewo language area

Lewo is very closely related to Lamel (73.0% – 78.8% of similar vocabulary in Tryon 1976; Tryon in fact lists them as one language) and to Bierebo (68.8% – 82.9%), and less so to the other Epi languages (Bieria [average 47%], Baki [average 65%], and Maii [average 51%]). These Epi languages comprise a closed subgroup of the North and Central Vanuatu subgroup of Eastern Oceanic languages of the Austronesian language family.

Primary sources for this wordlist were Elder Yoan Omawa, originally of Nivenue village, now resident in Moriu, and Chief Yoan Parmasusu of Moriu. (A map including Epi languages with the other languages of north and central Vanuatu can be found in Tryon 1986: 240.)

## 2. Phonology

*Table 2. Vowels*

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a ā</i>	

## 3. Morphology

Basic word order in Lewo is SVO. Some interesting features of its structure include a very productive nominalisation process, which uses the disjunctive morpheme (*na-*)...-*ena*; frequent use of body part idioms using *sine-* ‘gut’; well-documented verb-initial consonant alternations used to mark

realis/irrealis aspect (Tryon 1986); and a negative construction that places *pe* and *re* before and after the verb respectively, and *poli* at the end of the clause:

*lala a-pisu-ari sa-la sisi la*  
 3pl 3pl-REAL.look-endure POSS-3pl child pl  
 ‘They look after their children.’

*lala pe a-pisu-ari re sa-la sisi la poli*  
 3pl NEG 3pl-REAL.look-endure NEG POSS-3pl child pl NEG  
 ‘They didn’t look after their children.’

Also of interest in the verb is a very pervasive kind of serialisation. Most of the forms that occur subsequent to the main verb are not found as main verbs themselves, and so are indistinguishable from what might be called “close-knit verbal modifiers”:

*kila-ro-kare*  
 do-divide-destroy  
 ‘damage something in the process of dividing it in two’

*pisa-ari-riru-li-a*  
 REAL.say-endure-well-try-OBJ  
 ‘try and promise properly’

#### 4. Previous studies

Ray (1926: 229) is aware of the name Lewo, but writes more extensively of Lamenu and Tasiko, the latter of which is now regarded as a nearly extinct dialect of Lewo. Ray gives a sketch of Tasiko grammar (1926: 236-245), and lists previous studies that had been made of all the Epi languages (e.g. Codrington 1885), as well as the mission publications that had been produced in them. Capell (1962: 215-218) comments on the gloomy effects that depopulation had had on Epi, and describes it as “one of the decayed islands”. He also notes how the dialect situation had become somewhat different from that given by Ray earlier. Capell links Tasiko, Lewo and Lamenu as dialects of one language, and comments that the Epi languages have an “outlook...southward” to Tongoa and Efate for their closest linguistic relatives. Other language material gathered by Capell on Epi remains unpublished.

Two important contributions concerned with historical reconstruction that include Lewo are Pawley (1972) and Clark (1985), both of which draw on the earlier published material, although this is expanded from more recent sources in the latter paper.

Tryon's major classification of Vanuatu languages (1976) includes wordlists from 14 Epi language communities, eight of which are from the Lewo language. As noted, Tryon includes Lamenu here, but current local perception and literature production efforts regard Lewo and Lamenu as two distinct languages. Tryon has collected other data on Lewo and other Epi languages as well, and the compiler of this list is intending to pursue studies in Lewo in the near future.

Book Five of Miller's recent church history of Vanuatu includes useful documentation of early mission involvement in the Epi languages and in the production of literature in them (1987: 339-441).

# 61. Port Sandwich

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Jean-Michel Charpentier</i>
--

---

---

## 1. Introduction

---

Port Sandwich is the name of a large bay on the south-east coast of the island of Malekula, Vanuatu. All the tribes living on the northern coast of this bay disappeared during the last years of the nineteenth century. They were killed in tribal wars with their neighbours. For almost a century now, only the southern coast of the Port Sandwich bay, and by extension the peninsula of the same name, have been populated by approximately 1,000 inhabitants.<sup>1</sup> As no term existed to designate the language of this region, when I wrote my thesis I called it "Port Sandwich" according to the name of the area where it is spoken.

Nowadays this community is culturally very homogeneous. The population is Roman Catholic. The last conversions occurred in 1923 and since then all the children have attended French schools.

Nevertheless the study of the local language still reveals the former dialects. Traditionally most of the ancestors of the Port Sandwich people lived on the hills at some distance from the sea. According to their clan structure, all the men of one or two clans lived at a distance of one or two miles from the *nakamal* 'men's club house'. Conflicts between the various *nakamals* and continuous vendettas often prevented inter-marriage with the nearest neighbours. For generations the girls married men from other *nakamals*. Some *nakamals* on the Port Sandwich peninsula used to exchange wives with Uliveu and Wulai, islands located some five miles from the south coast of Malekula. Other Port Sandwich *nakamals* exchanged wives with the former *nakamals* of the north coast of Port Sandwich Bay. These preferred external exchanges were seldom a consequence of any danger of endogamy but rather a result of local antagonisms. So in some *nakamals* of the Port Sandwich peninsula a large majority of the women spoke a foreign language,

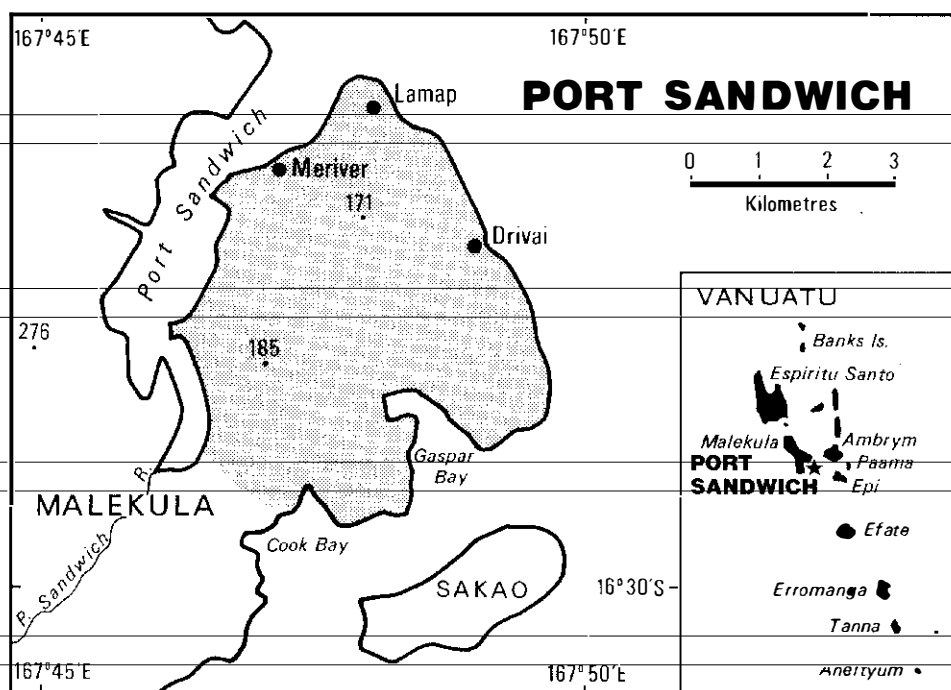

---

1. Since independence (1980) they have reclaimed their ancestral lands to the north of the bay, occupied for a century by European planters. However, they do not reside in this area.

---

---

as well as the Port Sandwich language which they spoke with their husbands. Before the arrival of missionaries, in many nakamals children were bilingual and the Port Sandwich language, their fathers' tongue, was naturally influenced by their mothers' linguistic backgrounds. Differences in dialect existed at the lexical and even phonemic levels. As the Port Sandwich area became Roman Catholic and the surrounding parts of Malekula Island became Presbyterian, the traditional exchanges of wives ceased, and Port Sandwich men married women from the peninsula. The population was large enough to escape from the dangers of endogamy. Nowadays the youngsters do not speak two Melanesian languages as did many people of the older generations. The present generation has only one mother tongue. They know the pidgin Bislama, which they use as a "lingua franca" with their fellow countrymen. All of them are trilingual; French is the medium of education and is commonly spoken fluently in the Port Sandwich region.

Map 61. Port Sandwich language area

The last traces of the former "clanic" bilingualism are noticeable only at the phonetic level; people whose grandmother came from Uliveu still do not pronounce the Port Sandwich retroflex /<sup>n</sup>dʀ/ but a prenasalised dental stop [<sup>n</sup>d] existing in the Uliveu language; the affricate /č/ in Port Sandwich is pronounced [ç] by Uliveu descendants.

Such cases of former bilingualism are now vanishing rapidly and the Port Sandwich area can be considered linguistically homogeneous.

The following wordlist was prepared in the field with the help of Damien Litoung, who died before publication of this work. Damien's knowledge of Port Sandwich was considered by the community as the most extensive and best.

During the last twenty years many young people from Port Sandwich have migrated to Port Vila, the capital, situated on the island of Efate. There, they seldom use their mother tongue even when they are married to a member of their own community. In Vila, children with Port Sandwich parents often speak better French and Bislama than their grandparents' vernacular.

In multilingual states like Vanuatu, Port Sandwich, with only 1,000 speakers, is not a language in danger. Many languages of the group have fewer speakers and are keeping up well because all their neighbours, though they are more numerous, can understand this language and so allow the native speakers to use it without any restriction. In Vanuatu and particularly in Malekula, everyone can understand many other local languages, although they have a good command of only two; their maternal and paternal languages. Port Sandwich is understood by the inhabitants of Uliveu with 1,000 speakers; of Akhamb with 400 inhabitants; of Faraun with 150; of Avokh-Morbakho with 250; of Vetbong with 25. This network of imperfect bilingualism results in great linguistic stability in this country of less than 150,000 inhabitants with 105 existing languages. This peculiar multilingualism restricts the use of Bislama, the local pidgin English, and prevents its creolisation.

Until 1970, when the author arrived in Port Sandwich, no real scientific study of this language had been conducted. The only existing work in this area had been carried out by Bishop Victor Douceré (1936) who wrote a comparison of Port Sandwich with European languages. Although he knew Port Sandwich well, he had no scientific background. No other description of this language exists except some sketches written by sailors at the end of the last century and the general study made by S.H. Ray (1926).

From 1970 to 1973 the present author lived in the Port Sandwich area. He wrote a monograph (Charpentier 1979) and two dictionaries Port-Sandwich-French, and French-Port-Sandwich (Charpentier 1974a, 1974b). After various periods of field-work in this area, he published his *Atlas linguistique du Sud-Malakula* (Charpentier 1982), in which Port Sandwich is included.

---

---

## 2.3 Inventory of vowels

With seven vowel phonemes, Port Sandwich is an exception among the Melanesian languages of this area, which normally present five vowel systems.

Table 2. Vowels

	Front unrounded	Central rounded	Back
High	<i>i</i>	<i>ü</i>	<i>u</i>
Mid	<i>e</i>	<i>ö</i>	<i>o</i>
Low		<i>a</i>	

Among young people and as a consequence of former bilingualism, there are trends towards a simplification of this system and the disappearance of the front rounded vowels /*ü*/ and /*ö*/. Some idiolects show neutralisation of the oppositions /*i*, *ü*/ or /*u*, *ü*/ and also /*o*, *ö*/.

## 2.4 Notes on morphology

### 2.4.1 Nouns

Very few nouns are simple roots without affixes or not combined with other roots.

<i>ča<sup>u</sup>gon</i>	‘ox or castrated pig’
<i>limu</i>	‘heron’
<i>ičao</i>	‘knife’

Most of the nouns in Port Sandwich are marked by a prefix: *na-*, *n-*, *ni-*, *nö-*, *nə-*.

<i>na-ran</i>	‘the earth’
<i>n-öai</i>	‘the water’
<i>ni-če</i>	‘the spring’

The use of a hyphen indicates that the roots can be found separately:

- (1) when the noun is the object in a sentence, often it is not marked.
- (2) when the noun root is a base which is a verb in another position.

<i>ni-čee-če</i>	‘the-spring it-springs’
<i>na-vie-vi</i>	‘the-lightning it-is lightning’

The articles *n-*, *na-*, *ni-*, etc. are inseparable from many nouns. They would be misunderstood without them.

<i>nave</i>	‘stingray’ ; ** <i>ve</i>
<i>naröv</i>	‘sugarcane’ ; ** <i>röv</i>

*navar* ‘kidney’ is written without a hyphen, but *na-var* ‘the-stone’ has one because the root *var* is a component in many compound nouns, e.g. *var-ümör* ‘volcanic stone’.

Nouns can be easily recognised by the suffixes they bear. Most verbs bases can take the suffixes *-an* or *-ian* and become nouns.

<i>mesax</i>	‘to be sick’	<i>mesaxian</i>	‘sickness’
<i>xan-i</i>	‘to eat-s.th.’	<i>xanian</i>	‘food’

Like all the other languages of Malekula possession is indicated by suffixes added to a noun.

<i>vĕā-u</i>	‘hand-his’
<i>söa-m</i>	‘wife-yours’
<i>pene-<sup>g</sup></i>	‘sister-mine’

As these suffixes (*-n*, *-m*, *-<sup>g</sup>*) are interchangeable, a hyphen has been added.

In Port Sandwich a ‘neutral’ possessive suffix *-xer* also exists for things.

<i><sup>g</sup>ge-xer</i>	‘tail-of s.th.’
<i>nüru-xer</i>	‘the-skin-of s.th.’
<i>nu-xer</i>	‘leaf-of s.th.’
<i>nu-kai</i>	‘leaf-wood’

Hyphens also allow the differentiation of uncompleted compound words (nouns here) from amalgams.

<i>melka<sup>m</sup>bür</i>	‘(place to bake) oven’
<i><sup>m</sup>bar rivot</i>	‘(head tooth) molar tooth’

All the words can be used separately. These pairs form successions “determined” “determiner”.

When one of these words ceases to have an independent existence in Port Sandwich or exists in an altered form, we add a hyphen.

<i><sup>m</sup>bur-xunüaün</i>	‘nostril’
<i><sup>m</sup>ör</i>	‘noie’
<i>xunüsü-n</i>	‘nose-his’

The use of a hyphen is necessary when the meaning of the compound word is not the sum of the meanings of its components.

<i>man-<sup>m</sup>buas</i>	‘(bird-pig) hawk’
<i>vün-mara-n</i>	‘(coconut rope-eye-his) eyelash’

Nouns can be composed of a noun and a reduplicated base as determiner. The final term then designates function.

<i>nu-kaimünmün</i>	‘(leaf-wood drinkdrink) medicine, drug’
---------------------	---

Nouns can present a succession of two nouns linked by a preposition.

<i>ra<sup>ŋ</sup>gač a vea-n</i>	‘(claw to hand-his) fingernail’
<i>na-<sup>m</sup>ber a n-öa<sup>ŋ</sup>g</i>	‘(the-post to the-canoe) mast’

## 2.4.2 Verbs

Verbs are commoner than nouns as predicates in Port Sandwich sentences. Distinctions can be made between unmarked verbs (simple roots) and marked verbs followed by suffixes.

<i>mač</i>	‘die’
<i>pač</i>	‘sleep’
<i>vanima</i>	‘come’

When the verb is transitive, the suffix *-i* indicates the possibility of an object.

<i>e-xan-i</i>	‘he, she, it-eat-s.th.’
----------------	-------------------------

This suffix can disappear when the object is expressed.

<i>e-xan na-<sup>n</sup>d<sup>r</sup>am</i>	‘he eats (the-) yam’ or
<i>e-xan-i na-<sup>n</sup>d<sup>r</sup>am</i>	

When the meaning of the verb assumes a beneficiary and an object, two suffixes are added.

<i>pisax-in-i</i>	‘distribute, share (give-to s.o.-s.th.)’
<i>süe-in-i</i>	‘order, command (story-to s.o.-s.th.)’

Sometimes (rarely) a personal suffix follows a transitive verb.

<i>nö-mači-m</i>	‘I-kill-you’
<i>e-kani-<sup>ŋ</sup>g</i>	‘he-accompany-me’

These suffixes correspond to the noun possessive suffixes (see 2.4.1).

## 62. North Tanna

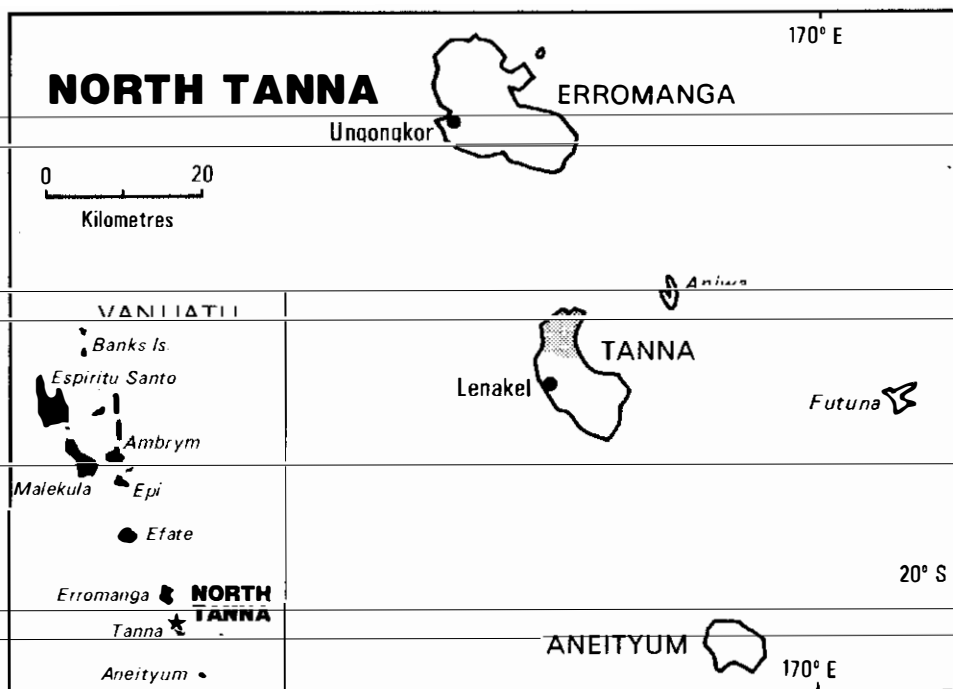

**Contributor:**

Introduction and Wordlist : *Joan Blaymires*

### 1. Introduction

The North Tanna language is spoken by approximately 2000 people in the northern part of Tanna, in Southern Vanuatu. It is a little-studied language, although it is treated briefly by Tryon (1976) and Lynch (1978). It is similar in many respects to Lenakel and Whitesands to its south. North Tanna has two main dialects, east and west. The major differences between the two are:

1. The western dialect is characterised by voiced prenasalised allophones for bilabial and alveolar stops.
2. Different sets of tense/aspect prefixes on the verb.
3. Different verbal prefix ordering.

Map 62. North Tanna language area

The two dialects are 90% cognate based on a standard wordlist. In fact these two dialects form the northern end of a dialect chain reaching down to the Whitesands language further south. Cognate percentages are 76% and 80% for western and eastern dialects respectively with Whitesands (Blaymires 1986). The wordlist presented in the present volume was elicited in the eastern dialect.

## 2. Phonology

The phonemes of North Tanna are as follows:

*Table 1. Consonants*

		Labialised labial	Bilabial	Alveolar	Velar	Glottal
Stops		<i>p<sup>w</sup></i>	<i>p</i>	<i>t</i>	<i>k</i>	
Fricatives	vl		<i>f</i>	<i>s</i>		<i>h</i>
	vd		<i>β</i>			
Nasals		<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>	<i>ŋ</i>	
Laterals				<i>l</i>		
Flaps				<i>r</i>		

*Table 2. Vowels*

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>o</i>	<i>o</i>
Low		<i>a</i>	

## 3. Morphosyntax

### 3.1 Pronouns

The pronouns of North Tanna are as follows:

	Singular	Dual	Trial	Plural
1 incl		<i>kilau</i>	<i>kitahal</i>	<i>kitat</i>
1 excl	<i>io</i>	<i>itəmlau</i>	<i>itəmohal</i>	<i>itmat</i>
2	<i>ik</i>	<i>ita(m)lau</i>	<i>itam<sup>w</sup>ahal</i>	<i>itam<sup>w</sup>at</i>
3	<i>in</i>	<i>ilau</i>	<i>ilhal</i>	<i>ilat</i>

### 3.1.1 Possessive suffixes

	Singular	Dual	Trial	Plural
1 incl		<i>-lau</i>	<i>-tahal</i>	<i>-tat</i>
1 excl	<i>-k</i>	<i>-təmlau</i>	<i>-təmihal</i>	<i>-tmat</i>
2	<i>-m</i>	<i>-ta(m)lau</i>	<i>-tam<sup>w</sup>ahal</i>	<i>-tam<sup>w</sup>at</i>
3	<i>-n</i>	<i>-lau</i>	<i>-lhal</i>	<i>-lat</i>

### 3.2 Deictics

North Tanna distinguishes the following deictics:

<i>u</i>	‘this’ (near speaker)
<i>un</i>	‘that’ (near person spoken to)
<i>ah</i>	‘that’ (away from both)
<i>ap<sup>w</sup>ah</i>	‘that’ (indicated/pointed to)

## 3.3 Nouns

### 3.3.1 Noun classes

Nouns in North Tanna fall into two major classes.

1. Alienable - includes most items. Possession is indicated by the use of *raha*:

Examples:

<i>nimara</i>	<i>Nalak</i>	‘Nalak’s house’
<i>nasumən</i>	<i>raham</i>	‘your garden’

2. Inalienable

This class includes most body parts and kinship terms plus a few others. It is indicated by suffixing a possessive pronoun (see 3.1.1 above) or an uninflected proper name to the item possessed.

Examples:

<i>nelki</i>	<i>Tom</i>	‘Tom’s foot’
<i>ita-k</i>		‘my mother’

### 3.3.2 Noun formatives

Nouns are formed from verbs or adjectives by the addition of the prefix *n-* and the suffix *-ən*.

Examples:

<i>asum</i>	‘weed the garden’	<i>ap<sup>w</sup>cap<sup>w</sup>e</i>	‘hot’
<i>nasumən</i>	‘garden’	<i>nap<sup>w</sup>cap<sup>w</sup>ən</i>	‘heat’

### 3.3.3 Locative noun phrases

Locative noun phrases are formed by the prepositions *i-* or *l-* plus noun head.

Examples:

<i>nthei</i>	‘the coast/sea’	<i>natuanu</i>	‘village’
<i>ithei</i>	‘to the coast/sea’	<i>latuanu</i>	‘to the village’

### 3.3.4 Noun phrases

In North Tanna nouns are followed by modifiers, as in the following examples:

<i>naʝunəʝasia</i>	‘red flower’
<i>pensilrahan</i>	‘his/her pencil’
<i>nahauatap<sup>w</sup></i>	‘cold water’
<i>naoa un</i>	‘that book (near you)’

## 3.4 Verbs

As with the other languages of Tanna, the verb phrase, characterised by numerous orders of prefixes and suffixes, is quite complex. A typical structure is as follows:

subject – tense/aspect – negative – number – verb – direction – negative

Examples:

<i>k</i>	<i>-am</i>	<i>-s</i>	<i>-ot</i>	<i>-ol-</i>	<i>ən</i>	<i>-ah</i>
3pl	-past	-NEG	-pl	-do	-NEG	-yet
‘They (pl) hadn’t yet done it.’						

The only obligatory elements are subject, number and root.

*k-ia-ol*  
 3pl-dl do  
 'they (2) do'

### 3.4.1 Subject prefixes

The North Tanna subject prefixes are as follows:

<i>i-</i>	1st person exclusive
<i>n-</i>	2nd person
<i>ɔ-</i>	3rd singular
<i>k-</i>	3rd plural; 1st inclusive
<i>m-</i>	same subject as previous verb

### 3.4.2 Number prefixes

<i>∅-</i>	singular
<i>u-, ia-</i>	dual (depending on initial vowel/consonant of root)
<i>hal-</i>	trial
<i>ot-</i>	plural

### 3.4.3 Tense/aspect prefixes

North Tanna tense/aspect prefixes are as follows:

<i>at-, ət-</i>	continuous, present (depending on initial vowel of root)
<i>ak-, o-</i>	future
<i>am-</i>	past
<i>ən-</i>	perfect
<i>apan-</i>	sequential
<i>ap-</i>	contrary to fact conditional

### 3.4.4 Negation

The negative is indicated by a discontinuous morpheme, thus:

<i>s-.....-ən</i>	negative
-------------------	----------

### 3.4.5 Directional suffixes

The principal directional suffixes are as follows:

<i>-pa</i>	'towards speaker'	<i>-par</i>	'inland'
<i>-pəna</i>	'towards person spoken to'	<i>-pah</i>	'towards coast'
<i>-pən</i>	'away from both'	<i>-pahap</i>	'north'
<i>-pər</i>	'up'	<i>-pis</i>	'south'
<i>-ahau</i>	'down'		

### 3.5 Interrogatives

North Tanna interrogatives include the following:

<i>pah</i>	'who?'	<i>onahŋan</i>	'when (future)?'
<i>hia</i>	'where?'	<i>naka</i>	'what?'
<i>kuəh</i>	'how many?'	<i>o naka</i>	'why?'
<i>nahŋan</i>	'when (past)?'		

### 3.6 Word order

The basic word order in the North Tanna language is SVO.

Examples:

<i>Tou tamalah</i>	'Tou laughed'
<i>Iautaməlh naŋunəŋ</i>	'Iau picked a flower'
<i>Kausu takaku</i>	'The rubber is small'

## 63. Kwamera

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Lamont Lindstrom</i>
---

---

---

### 1. Introduction

---

---

Kwamera is the language of approximately 2,000 people who live on the south-east and south coasts of the island of Tanna, Vanuatu. Nineteenth century missionaries named this language after the site of an early mission station. Speakers of the language today ordinarily call it Nife [Nəfe] or Nininife [Nəninəfe] (nominalising prefix + say + what), that is, 'say what'.

The language area extends from Mount Yasur on the central east coast down and around the southern tip of the island to Karimasaga Point, immediately to the north of Green Point (see map). In an area characterised by dialect chains and communalects, it is often misleading to map linguistic boundaries. The Tannese themselves, however, concerned with the value and distinctiveness of their languages, recognise geographic bounds that separate Kwamera from Whitesands language to the north, and from South-west Tanna language to the west. Tradition situates Kwamera's northern boundary in the centre of Ipikil village on Sulphur Bay. Two stones lie side-by-side near the sea: the northerly named Narhak (the local name for Whitesands language); the southerly named Nife [Nəfe] (see Lindstrom 1983). From Ipikil, the boundary runs west around Lake Siui and up to the central mountain crest. It follows a ravine called Karkaua – the instrumental form of the verb *-arkaua*, which means 'mispronounce'. Karimasaga Point on Tanna's southern coast marks the locally recognised linguistic boundary between Kwamera and South-west Tanna. Kwamera is the most different of the five or so related Tanna languages. Kwamera and Whitesands have a cognate ratio of 50%, and Kwamera and South-west Tanna one of 62% (Tryon 1976: 158-160).

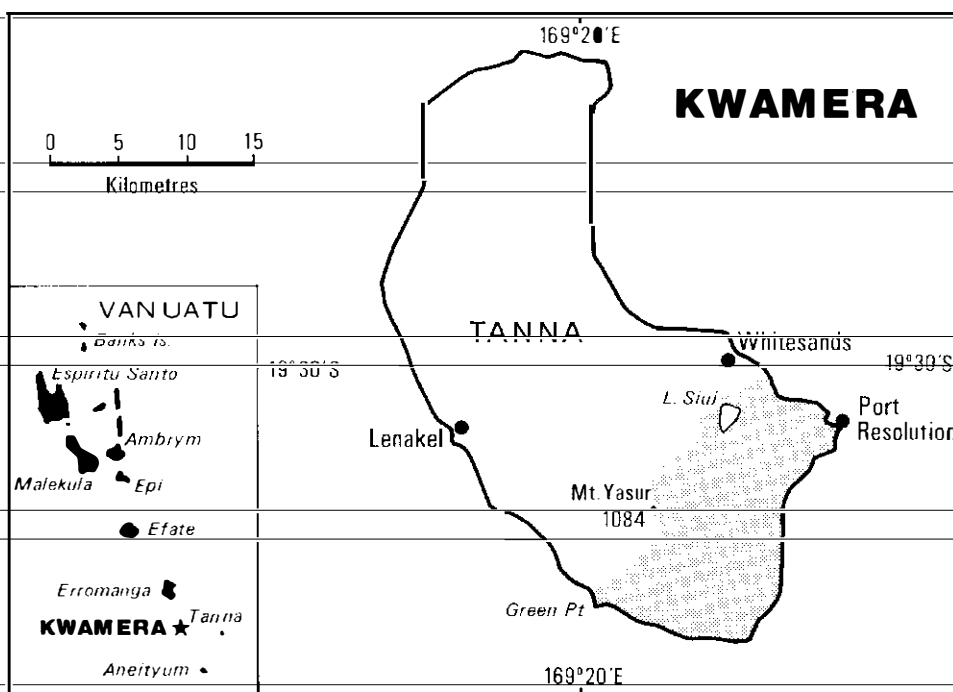

Pioneer missionary linguists produced a small body of religious and educational material in Kwamera (A. Watt 1890; W. Watt 1880, 1890, 1919). Their early wordlists and grammatical sketches are reported in Codrington (1885), MacDonald (1891), and Ray (1926). More recent work includes a Kwamera dictionary (Lindstrom 1986; see also 1985) and also dictionaries and grammars of neighbouring Tanna languages (Lynch 1975,

---

---

1977, 1978, 1982). Some wordlist items presented below are borrowings from Bislama, Vanuatu's Pidgin English. Readers may consult Tryon (1987) for additional information on this *lingua franca*.

I recorded linguistic data over a period of 26 months between 1978 and 1983, in conjunction with anthropological research on Tanna. Most of my informants were my neighbours in Samaria village, and items presented here are from that village's communalect. Other Kwamera communalects are centred around Port Resolution in the east, in hill villages west of Samaria, and in Imaki and Kwamera villages in the south. In the main, however, communalectical differences are minor, and consist mostly of lexical variants. I would like to thank Vani, Nakutan, Iau, Rapi, Joel, Saki, Iapwatu, Kamti, Nariu and Kieri, and acknowledge their co-authorship of this Kwamera lexicon.

Map 63. Kwamera language area

## 2. Phonology

Kwamera grammar and phonology are substantially similar to that of other Tanna languages. I draw especially on Lynch's (1975) analysis of Lenakel, spoken on the north-west coast, and his analysis of South-west Tanna (1982) for this summary of Kwamera phonology and morphology.

## 2.1 Word stress

Stress falls on the penultimate syllable of words, except in a few exceptional circumstances. Where /h/ occurs between identical vowels, the first vowel is discounted in stress application. Syllables are stressed irregularly if they include underlying geminate vowel clusters. (These geminate clusters are not indicated here; see Lindstrom 1986 for relevant description.)

- (1) *'kətaha* 'we (plural inclusive)  
*-'uwehe* 'come'  
*ni'amaha* 'anger'  
*neni'mē-* 'eye, face'  
*k<sup>w</sup>ani'hī-* 'penis'

## 2.2 Inventory of consonants

Kwamera has 15 consonant phonemes.

*Table 1. Consonants*

	Labialised labial	Bilabial	Alveolar	Velar	Labialised Velar	Glottal
Stops	<i>p<sup>w</sup></i>	<i>p</i>	<i>t</i>	<i>k</i>	<i>k<sup>w</sup></i>	
Fricatives	<i>ɸ<sup>w</sup></i>	<i>ɸ</i>	<i>s</i>			<i>h</i>
Nasals	<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>	<i>ŋ</i>		
Flaps			<i>r</i>			
Glides		<i>w</i>				

### 2.2.1 Discussion

All stops are lenis. They become voiced intervocalically, and may or may not be voiced elsewhere except in word final position. The labialised bilabial fricative, in some Kwamera communalects, varies freely with [f]. Alveolar /s/ and /t/ are dental-alveolar; the latter is palatalised when it precedes /i/. The flap /r/ is trilled word finally. The glide /w/ is a high central, unrounded semivowel, phonetically [ɨ]. Sonorants /m<sup>w</sup>/, /m/, /n/, /ŋ/, /r/ and /w/ are all devoiced when followed by /h/.

## 2.3 Inventory of vowels

Table 2. Kwamera vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Low		<i>a</i>	

### 2.3.1 Discussion

The high vowels /i/ and /u/ become lax in closed syllables. They ordinarily become glides [y] and [w] when next to another vowel. The low vowel /a/ is backed and rounded when adjacent to the labialised labials /p<sup>w</sup>/, /m<sup>w</sup>/, /ɸ<sup>w</sup>/, the labialised velar /k<sup>w</sup>/, and the central glide /w/.

## 2.4 Notes on the shape of words and syllables

Vowel and consonant clusters may occur throughout a word, except word finally in the case of the latter.

- |     |   |                           |
|-----|---|---------------------------|
| (2) | <i>-eiuaiu</i>                                      | ‘descend’                 |
|     | <i>trak<sup>w</sup>ak<sup>w</sup>i</i>              | ‘tomorrow, the day after’ |
|     | <i>-skamter</i>                                     | ‘stand up’                |
|     | <i>nəmnəmu</i>                                      | ‘coconut parasite’        |
|     | <i>-ak<sup>w</sup>mak<sup>w</sup>m<sup>w</sup>i</i> | ‘speak indistinctly’      |

Many nouns begin with /n/ plus a following vowel, particularly /ə/. This derives from the Proto-Oceanic article \**na*. I include the vowel in my representation of noun roots here, although in some cases it is epenthetic.

- |     |               |        |                                 |              |
|-----|---------------|--------|---------------------------------|--------------|
| (3) | <i>nəkawa</i> | ‘kava’ | <i>nəpiki-</i>                  | ‘tail’       |
|     | <i>nəɸata</i> | ‘bed’  | <i>k<sup>w</sup>anpikipukah</i> | ‘pig’s tail’ |

Kwamera possessive structures are complex. A set of inalienable or directly possessed nouns takes possessive suffixes. These words are marked with a final hyphen.

- |     |                  |              |               |          |
|-----|------------------|--------------|---------------|----------|
| (4) | <i>nəpasegi-</i> | ‘nose’       | <i>naghu-</i> | ‘name’   |
|     | <i>rəgi-</i>     | ‘upper limb’ | <i>remu-</i>  | ‘father’ |
|     | <i>takuta-</i>   | ‘back’       |               |          |

Most Kwamera nouns are morphologically simple, although a few human nouns have a plural form, signalled with the prefix *n-* or *nə-*.

(5)	<i>iema</i>	‘man’	<i>nema</i>	‘men’
	<i>pran</i>	‘woman’	<i>nəpran</i>	‘women’

Some nouns are formed by attaching affixes to roots of other word classes. These affixes include *i-* (agentive); *n-* for plural); *k-* (instrumental); *sa-* (identificatory nominaliser); *n-* or *n...-ien* (general nominalisers); and *p-* (directional nominaliser).

(6)	<i>-akres</i>	‘steal’	<i>iakres</i>	‘thief’
	<i>nakres</i>	‘thieves’	<i>nakresien</i>	‘stealing’
	<i>-auas</i>	‘strike’	<i>kauas</i>	‘club’
	<i>pam</i>	‘last’	<i>sa(m)pam</i>	‘the last one’
	<i>-apua</i>	‘cloudy’	<i>napua</i>	‘cloud’
	<i>-eraha</i>	‘towards the sea’	<i>peraha</i>	‘seawards’
	<i>-euaiu</i>	‘descend’	<i>peuaiu</i>	‘downwards’

Except for singular imperatives, Kwamera verbs are morphologically complex, always taking person, number, tense, aspect, transitive, directional and/or reciprocal affixes. (Verb roots are given here with an initial hyphen marking this fact.) I present only a few morphological examples below; for complete information, see Lynch (1978, 1982), Lindstrom (1986).

(7)	<i>-aiu</i>	‘run’
	<i>t-sa-ϕ-am-aiu</i>	‘how will we be running?’
	FUT-1pl incl-int-cont-run	
	<i>-o</i>	‘do’
	<i>kr-p-n-o</i>	‘if they two had done’
	3dl-cond-perf-do	
	<i>-aki</i>	‘dislike’
	<i>raki-atuk<sup>w-i</sup></i>	‘he dislikes himself’
	3sg-dislike-reflex-trans	
	<i>-awahi</i>	‘give, take, bring’
	<i>har-pək-awahi-pen</i>	‘then they three give’
	3trial-seq-give-dir(away)

## 64. Nemi

**Contributor:**

Introduction and Wordlist: *Françoise Ozanne-Rivierre*

### 1. Introduction

Nemi, with approximately 325 speakers (Rivierre 1981) is a member of the Northern subgroup of New Caledonian languages (Haudricourt 1971).

Like the other languages of the Northern subgroup, Nemi is characterised by a rich consonantal system with a double series of aspirated and non-aspirated oral and nasal consonants. What particularly distinguishes Nemi is that it has also a series of post-nasalised consonants ( $p^{m^w}$ ,  $p^m$ ,  $t^n$ ,  $c^{\tilde{n}}$ ,  $k^{\tilde{y}}$ ) which are the principal source of the nasal vowels of the other member languages of the Northern subgroup (Haudricourt – Ozanne-Rivierre 1982: 29-31).

Map 64. Nemi language area

There are two varieties of Nemi. The first, Nemi 1, is spoken on the west coast of New Caledonia in the Témala region. This variety has preserved a consonantal system which is almost as rich intervocalically as word-initially. On the other hand, the second variety, Nemi 2, spoken on the east coast in the Hienghène region, has undergone further development, resulting in a simplified system of intervocalic consonants. It is this second variety for which our data are more comprehensive, that is represented in this volume.

*Table 1. Consonants*

		Labialised labial	Labial	Apical/ laminal	Palatal	Velar	Glottal
Stops	vl plain	$p^w$	$p$	$t$	$c$	$k$	
	vl aspirate	$p^{hw}$	$p^h$	$t^h$		$k^h$	
	vl postnas	$p^{mw}$	$p^m$	$t^n$	$c^{\tilde{n}}$	$k^{\tilde{p}}$	
	vd prenas	$b^w$	$b$	$d$	$\mathcal{J}$	$\mathcal{G}$	
Fricatives	vl		$f$	$s$			$h$
	vd		$v$				
Nasals	vl	$m^w$	$m$	$\eta$	$\tilde{\eta}$		
	vd	$m^w$	$m$	$n$	$\tilde{n}$	$\eta$	
Laterals	vl			$l$			
	vd			$l$			
Semivowels	vl	$w$			$y$		
	vd	$w$			$y$		

With certain grammatical words, in word initial position the Nemi 1 aspirated stop /t<sup>h</sup>/ is realised as either an aspirated or unaspirated trill [r<sup>h</sup>] or [r] in Nemi 2 (e.g. /t<sup>h</sup>a/, ‘here’, /t<sup>h</sup>u/ ‘agentive marker’ in Nemi 1 > [r<sup>h</sup>a] and [ru] in Nemi 2).

It is noteworthy also that /s/ in Nemi derives historically from an aspirated palatal stop /c<sup>h</sup>/, still attested in certain neighbouring languages (Pwapwâ, Caac).

In Nemi 1, the consonantal system in intervocalic position is almost the same as for initial position. Only a few aspirated consonants /-p<sup>hw</sup>-, -p<sup>h</sup>-, -k<sup>h</sup>-/ do not appear, and /-s-/ appears only in borrowings.

In Nemi 2 the intervocalic system is considerably reduced. This simplification, compared to Nemi 1, results from the following mergers and changes:

Principal mergers:

Other developments:

- p- > -v- ;
- k- > -γ- ;
- f-, -v-, -y-(partially), -γ-, -h- > ∅.

The following consonantal system results:

*Table 2.* Intervocalic consonantal system (Nemi 2)

	Labialised labial	Labial	Apical	Palatal	Velar
Stops prenasalised	<i>b<sup>w</sup></i>	<i>b</i>	<i>d</i>	<i>ʃ</i>	<i>g</i>
Fricatives		<i>v</i>			<i>ɣ</i>
Nasals	<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>	<i>ɲ̃</i>	<i>ŋ</i>
Laterals			<i>l</i>		
Trills			<i>r</i>		
Semivowels	<i>w</i>			<i>y</i>	

It should be noted, however, that some stops (*-p<sup>w</sup>*, *-p-*, *-t-*, *-c-*, *-k-*) and the continuants (*-f-*, *-s-*) have been reintroduced into Nemi 2 through loanwords (French, English, Bislama, Polynesian or neighbouring languages).

In word-final position, both in Nemi 1 and Nemi 2, there is only a two-way opposition between oral and nasal consonants:

*Table 3.* Final consonant system (Nemi 1 and Nemi 1)

oral	<i>p</i>	<i>t</i>	<i>c</i>	<i>k</i>
nasal	<i>m</i>	<i>n</i>	<i>ɲ̃</i>	<i>ŋ</i>

Note that the prenasalised consonants *<sup>m</sup>b<sup>w</sup>*, *<sup>m</sup>b*, *<sup>n</sup>d*, *<sup>ɲ̃</sup>ʃ* and *<sup>ŋ</sup>g* have been written without prenasalisation, thus: *b<sup>w</sup>*, *b*, *d*, *ʃ* and *g*.

## Vowels

There are five vowels in Nemi, *i*, *e*, *a*, *o*, *u*. Vowel length is phonemic. Nasalised vowels are rare and appear only in restricted contexts, namely word-initially or after *w*, *h* and *ɰ* (e.g. *ũda* 'vomit'; *wãk* 'rope'; *hũe* 'spear-thrower'; *ɰã* 'preach').

*Table 4.* Vowels

	Front	Central	Back
High	<i>i ĩĩ</i>		<i>u ũũ</i>
Mid	<i>e ěě</i>		<i>o õõ</i>
Low		<i>a ãã</i>	

### Principal prefixes and suffixes

<i>pa-</i> , <i>fa-</i>	causative prefixes; e.g. <i>pa-we-i</i> ‘to give birth’ ( <i>p<sup>w</sup>ec</i> , ‘be born’); <i>fa-hun-i</i> ‘honour’ ( <i>hun</i> , ‘big’).
<i>pe-</i>	reciprocal or reflexive prefix, e.g. <i>pe-bani</i> ‘to meet’.
<i>ba-</i>	instrumental prefix, e.g. <i>ba-hāt</i> ‘oar’; (lit. ‘for-rowing’).
<i>ka-</i>	agentive prefix; e.g. <i>ka-guna</i> ‘thief’; (lit. ‘one who-steals’).
<i>kave-</i>	place of, trace of; e.g. <i>kave-mō</i> ‘country’ (lit. ‘place-stay’).
<i>hun-</i>	manner of; e.g. <i>hun-b<sup>w</sup>eri</i> ‘attitude’; (lit. ‘manner of-turn’)
<i>-i</i>	transitive suffix; e.g. <i>t<sup>n</sup>ōn</i> ‘run’; <i>t<sup>n</sup>ōn-i</i> ‘pursue trans’.
<i>-n</i>	3sg possessive suffix; this suffix appears in the lexicon marking inalienable nouns: body parts, kinship terms, parts of a whole, etc.

## 65. Cèmuhî

### Contributor:

Introduction and Wordlist : *Jean-Claude Rivierre*

### 1. Introduction

Cèmuhî [cemuhĩ] is spoken by approximately 3000 speakers in the north-central area of mainland New Caledonia. Together with Paicî, further to the south, it constitutes a central mainland tonal language subgroup.

### 2. Phonology

Syllables have the shape V, CV or CVC. Only morpheme-final syllables may be closed syllables of the CVC type.

Cèmuhî is a language with three register tones marked thus: ( ´ ) high tone, ( ^ ) mid tone, ( ` ) low tone. In the majority of cases the tone of the initial syllable indicates the tone of the whole morpheme (thus only the tone of the initial syllable is marked).

Map 65. Cèmuhî language area

## 2.1 Consonants

### Initial and intervocalic consonants

Consonants may be grouped into three series, so presenting a nasality cline: nasals, semi-nasals (prenasalised), and oral consonants. The following consonants are phonemic in initial and intervocalic position:

*Table 1.* Consonants

	Labialised labial	Bilabial	Alveolar	Alveo- Palatal	Velar	Glottal
Nasals	$m^w$ $h^{\tilde{w}}$	$m$	$n$	$\tilde{n}$	$\eta$	$\tilde{h}$
Semi-nasals	$b^w$	$b$	$d$	$\mathcal{J}$	$g$	
● Oral consonants	$p^w$ $w$	$p$	$t$ $(r)$ $l$	$c$	$k$	$(h)$

(Note that the semi-nasals  $^m b^w$ ,  $^m b$ ,  $^n d$ ,  $^{\tilde{n}} \mathcal{J}$ ,  $^{\eta} g$  have been written simply as  $b^w$ ,  $b$ ,  $d$ ,  $\mathcal{J}$  and  $g$ ).

- The consonants  $p^w$ ,  $p$ ,  $t$ ,  $c$  and  $k$  are only lightly stopped. They tend to be realised as fricatives in the speech of young speakers.
- /l/ is common in intervocalic position, but exists in only a few grammatical morphemes in initial position (articles, pronouns, etc.).
- / $\tilde{h}$ / and / $h^{\tilde{w}}$ / are nasal consonants, always followed by a strongly nasalised vowel (this nasalisation is not written in the wordlist). Historically these two consonants come from a series of post-nasalised consonants still attested in Nemi (see F. Ozanne-Rivierre, this volume, pp. 849-853). Non-nasal /h/ and /r/ exist in only a few loanwords.

### Final consonants

In final position phonemic oppositions are reduced to the following:

Nasals	$m$	$n$	$\eta$
Oral consonants	$p$	$t$	

The following alternations occur before an affix or when the following word begins with a consonant.

/-p/ is replaced by [-ɛ] after /i/ and /e/  
 [-ɔ] after /u/ and /o/  
 e.g. *âpulip* ~ *âpulie* 'man'  
*pûp* ~ *pûɔ* 'cough'

/-t/ is replaced by [-lɛ] in most cases  
 e.g. *cámɛt* ~ *cámɛlɛ* 'fog'

These alternations are free when the word is pronounced in isolation.

## 2.2 Vowels

With open syllables there are four vowel heights distinguished, and for each of the following there is a phonemic opposition between long and short vowels:

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Mid	<i>ɛ ɛ̄</i>		
Low		<i>a a</i>	

- /ɛ/ may become [ɔ] after /u/, /o/ and labio-velars.
- The opposition between /ɛ/ and /a/ is neutralised in word-final closed polysyllables.
- Some /ū/ and /ā/ occur word-initially or after /w/.

## 3. Principal prefixes and suffixes

*pá-*, *pà-* : causative prefixes, e.g. *pá-úde* 'extinguish' (*úde* 'extinguished');  
*pà-tîp*<sup>wɔ</sup> 'knock down, let drop' (*tîp*<sup>wɔ</sup> 'fall').

*pî-* : reciprocal prefix, reflexive, middle voice, e.g. *pî-òcit* 'look at oneself (in a mirror)'.

<i>bê-</i>	: instrumental prefix, e.g. <i>bê-p<sup>w</sup>ôp<sup>wi</sup></i> ‘sickle’ (for clearing land).
<i>â-<sub>1</sub></i>	: agentive prefix, e.g. <i>â-wêa</i> ‘sentinel’ (‘one who guards’).
<i>â-<sub>2</sub></i>	: place of, e.g. <i>â-têb<sup>w</sup>ɔ</i> (‘place-sit down’).
<i>b<sup>w</sup>ô-</i>	: way of, manner of, e.g. <i>b<sup>w</sup>ô-mú</i> ‘custom, law’ (‘way of-living’).
<i>-hĩ</i>	: transitive suffix, e.g. <i>ñĩbe</i> ‘oven’, <i>ñĩbê-hĩ</i> ‘put in the oven’.
<i>-n</i>	: possessive suffix, 3rd person singular.

Table 3. Personal pronouns

		Independent predicative	Agent proposed	Object postposed	Possessive	Stative
Singular	1	<i>waco</i>	<i>c</i>	<i>-o</i>	<i>-ŋ</i>	<i>-ʃo</i>
	2	<i>wogo</i>	<i>go</i>	<i>-ko</i>	<i>-m</i>	<i>-go</i>
	3	<i>wêŋ</i>	<i>ɛ</i>	<i>-ɛŋ</i>	<i>-n</i>	<i>-naŋ</i>
Plural	1 incl	<i>wogañe</i>	<i>gañe</i>	<i>-kañe</i>	<i>-ñe</i>	<i>-gañe</i>
	1 excl	<i>wogame</i>	<i>game</i>	<i>-kame</i>	<i>-me</i>	<i>-game</i>
	2	<i>wogawe</i>	<i>gawe</i>	<i>-kawe</i>	<i>-we</i>	<i>-gawe</i>
	3	<i>wote</i>	<i>le</i>	<i>-le</i>	<i>-le</i>	<i>-jele</i>
	1 incl	<i>wogañu</i>	<i>gañu</i>	<i>-kañu</i>	<i>-ñu</i>	<i>-gañu</i>
Dual	1 excl	<i>wogamu</i>	<i>gamu</i>	<i>-kamu</i>	<i>-mu</i>	<i>-gamu</i>

## 66. A'jië

---

---

<b>Contributors:</b>
Introduction: <i>Darrell T. Tryon</i>
Wordlist: <i>Sylvain Aramiou – Jean Euritein</i>

---

### 1. Introduction

---

A'jië is the name which native speakers use for the language which Europeans call Houailou (Wailu), the name of a mixed Melanesian/European village on the east coast of New Caledonia. It is a member of the Southern Group of New Caledonian languages (Haudricourt 1971).

A'jië is spoken on both the east and the west coasts of New Caledonia. To the north it is bounded by Paicî, as well as by Arhö and Arhâ, considered by some to be dialects of A'jië. To the South, A'jië is in contact with Orowe (Boewe) and Yirhë at Bourail. On the east coast it borders Xârâcùù.

Aramiou – Euritein (1986) note dialectal differences within the A'jië region as follows:

- Phonological – prosodic differences between the A'jië spoken in the valley (*mêrê néiřiwâ*) [mêřê neiřiwâ] and that spoken on the coast (*mêrê pwařawiè*) [mêřê pwařawie].
- In Poya: less frequent vowel harmony word initially.
- At Monéo: dialect influenced by the tonal system of neighbouring Paicî.
- In the South: special prosodic features due to the proximity of neighbouring languages.
- At Kouaoua: the dialect employs grammatical forms different from the remainder of the A'jië area.

Jacqueline de La Fontinelle (1976) distinguishes three dialects of A'jië, as follows:

1. *mêrê-a'kuru-é* [mêřê-a'kürü-e] (spoken in the Poya valley).
2. *mêrê-a'para-wiè* [mêřê-a'para-wie] (spoken on the east coast).
3. The dialect spoken at the bottom of the Poya valley on the western side of the central chain.

She also distinguishes generational differences among speakers, namely:

1. Those born before 1914.
  2. Those born after 1914.
- 
-

There are significant phonological differences between these generational groups, discussed below. Aramiou – Euritein (1986) estimate that there are approximately 7000 A'jië speakers.

Map 66. A'jië language area

As far as previous studies of A'jië are concerned, in 1897 S.H. Ray published a wordlist; Pastor Leenhardt arrived in 1901 and published a translation of the Gospel of Matthew in 1903, with the Gospel of John following in 1910. St. Matthew's Gospel: *Visheshi i Jesus Keriso na sou na Matthieu*, Paris, Société des Missions Evangeliques, 1903, was in fact translated by Pastor Mathaia, from Ouvéa in the Loyalty Islands. An A'jië catechism was published in 1905. Pastor Leenhardt also published and edited a periodical, *Virseri*, in A'jië, which first appeared quarterly, then monthly, until 1936. In 1932 Leenhardt published his *Documents néo-calédoniens*, which contain some thirty-odd texts of A'jië oral literature. In 1935 his *Vocabulaire et grammaire de la langue Houailou* appeared, based on the analysis of the texts. In 1976 Jacqueline de La Fontinelle published a detailed phonology and syntax, *La langue de Houailou (SELAF)*. In 1986 and 1987 the Fédération de l'Enseignement Libre Protestant (Aramiou – Euritein 1986, 1987) published an orthography of A'jië for use in schools and a collection of sixteen legends designed as a reader.

## 2 Phonology

The phonology of A'jië may be summarised in the following tables:

### 2.1 Consonants

Table 1. Consonants

	Labialised labial	Labial	Apical	Palatal	Velar	Labialised velar
<b>Stops</b>						
Oral	<i>p<sup>w</sup></i>	<i>p</i>	<i>t</i>	<i>c</i>	<i>k</i>	<i>k<sup>w</sup></i>
Prenasalised	<i>b<sup>w</sup></i>	<i>b</i>	<i>d</i>	<i>ʃ</i>	<i>g</i>	<i>g<sup>w</sup></i>
<b>Fricatives</b>						
		<i>v</i>	<i>r</i>	<i>y</i>	<i>ɣ</i>	<i>w</i>
<b>Nasals</b>						
	<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>	<i>ɲ</i>	<i>ŋ</i>	
<b>Laterals</b>						
			<i>l</i>			
<b>Trills</b>						
			<i>ʀ</i>			
<b>Flaps</b>						
			<i>ɾ</i>			

With speakers born before 1914, there is a phonemic opposition between /r/ (= [ɾ]), /ʀ/ and /r̄/ which is not maintained in the speech of younger speakers. Younger speakers recognise /r/ in the speech of the elders, but realise it as a trill /ʀ/ in their speech, opposing it to a flap /ɾ/.

### 2.2 Vowels

The vowels of A'jië are as follows:

Table 2. Oral vowels

	Front	Central	Back
High	<i>i</i>	<i>ɯ</i>	<i>u</i>
Mid-high	<i>e</i>	<i>ə</i>	<i>o</i>
Mid-low	<i>ɛ</i>	<i>ʌ</i>	<i>ɔ</i>
Low		<i>a</i>	

Table 3. Nasal vowels

	Front	Central	Back
High	ĩ	ũr	ũ
Mid	ẽ	ã	õ
Low		ã	

Vowel length is also phonemic in A'jië. Characteristic of A'jië also are a series of “glottalised” vowels. Thus one finds, for example, the following oppositions:

<i>kaʔ</i>	‘laugh’
<i>ka</i>	‘for’
<i>kã</i>	‘breadfruit tree’
<i>kã̃</i>	‘thing’

“Glottalised” vowels are heavily stressed, accompanied by a sharp interruption to the vibration of the vocal chords. The accompanying glottal stop itself is barely audible (La Fontinelle 1976: 140). Further examples:

<i>ja</i>	‘step forward’
<i>jaʔ</i>	‘run out (water)’
<i>jã</i>	‘hand of bananas’
<i>jãʔ</i>	‘limestone formation’

### 3. Morphology

#### 3.1 Pronouns

Table 4. Pronouns

	Pronouns subject	Possessives/pronouns object
1sg	gɔ	-ñã
2sg	gɛ	-i
3sg	na	-ə, -e, -ɛ, -ẽ
1pl incl	gere	-re
1pl excl	geve	-ve
2sg	gɔvə	-və
3sg	cere	-re

	Pronouns subject	Possessives/pronouns object
1dl incl	<i>gɔru</i>	<i>-ru</i>
1dl excl	<i>gɔvu</i>	<i>-vu</i>
2sg	<i>gɔu</i>	<i>-u</i>
3sg	<i>curu</i>	<i>-ru</i>

### 3.2 Prefixes

Some commonly used suffixes include:

<i>pɛ-</i>	causative
<i>pɛ -</i>	multiplicative
<i>vi-</i>	reciprocal

Examples:

<i>pɛ-sari</i>	‘make small’
<i>pɛ-toma</i>	‘erect, cause to stand’
<i>pɛ-karu</i>	‘twice’
<i>pɛ-kavue</i>	‘four times’
<i>vi-yɔ-mī</i>	‘to kill one another’

### 3.3 Suffixes

Some commonly encountered suffixes include:

<i>ā</i>	pejorative
<i>-ī</i>	continuity
<i>-reře</i>	breaking, cutting
<i>-vea</i>	uncovering, revealing
<i>-veā</i>	togetherness, collectivity
<i>-via</i>	binding
<i>-vī</i>	breaking
<i>-yɛ</i>	contact
<i>-yūi</i>	piercing.

Examples:

<i>ne-ā</i>	‘smell bad’
<i>pu-ī</i>	‘cough incessantly’
<i>ba-reře</i>	‘break off by shaking’
<i>da-via</i>	‘hit, strike’

<i>bA-vī</i>	'break'
<i>pa-yε</i>	'touch, feel'

There are three transitivising suffixes in A'jĕ, *-ri*, *-i*, *-rū*. *-rū* is used only with verbs of excretion, while the choice of the other two is unpredictable.

Examples:

<i>iā</i>	'cry'
<i>tā-rū</i>	'cry for'
<i>gō</i>	'vomit'
<i>gō-rū</i>	'vomit something'
<i>lā</i>	'spread'
<i>lā-i</i>	'spread out something'
<i>tū</i>	'seize, grab'
<i>tū-ri</i>	'seize someone. something'

#### 4. Syntax

The most common word order in A'jĕ is:

$S_{\text{pron}} + V + \text{DO} + S_n + \text{OO}(\text{oblique})$

Examples:

<i>na aʔraʔ na kaməʔ</i>	<i>na yio ka-cene</i>
he eat sm man	he cut clone-banana
'The man eats.'	'He cuts the banana.'
<i>gə tū-ri</i>	<i>gə ye vi</i>
I grab-trans	I fut go
'I grab him.'	'I shall go.'
<i>gə we vi</i>	<i>cere aʔraʔ na kaməʔ</i>
I comp go	they eat subj man
'I have already gone.'	'The men eat.'

# 67. Xârâcùù

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Claire Moyse-Faurie</i>
--

---

---

## 1. Introduction

---

---

The Xârâcùù [xârâc̥ī] language belongs to the southern sub-group of New Caledonian languages. It has approximately 4000 speakers, mainly in the Thio/Canala region on the east coast of New Caledonia.

---

---

## 2. Phonology

---

---

Syllable structure: all syllables are open; thus consonants do not occur in word final position. Sequences of consonants are also inadmissible.

---

---

### 2.1 Consonants

---

---

There are 26 consonants in both initial and intervocalic position. However, phoneme frequencies vary according to position. For example, /r/ occurs very frequently in intervocalic position, but occurs rarely in word-initial position, where it appears in only a dozen words, all functors.

---

---

*Table 1. Consonants*

---

---

	Labialised labial	Labials	Apicals	Palatals	Velars	Lab. velars
Stops plain	<i>p<sup>w</sup></i>	<i>p</i>	<i>t</i>	<i>c</i>	<i>k</i>	<i>k<sup>w</sup></i>
Stops prenas.	<i>b<sup>w</sup></i>	<i>b</i>	<i>d</i>	<i>ʃ</i>	<i>g</i>	<i>g<sup>w</sup></i>
Fricatives	vl vd	<i>f</i> <i>v</i>	<i>ʒ</i>	<i>ç</i>	<i>x</i>	<i>x<sup>w</sup></i>

Vibrants		<i>r</i>				
Semivowels	<i>w</i>		<i>y</i>			

---

---

Map 67. Xârâcùù language area

## 2.2 Vowels

There are 17 short vowels, with the same number of long counterparts, marked by a macron. As Grace (1975) stresses, vowel nasalisation is automatic before nasal and prenasalised consonants, at least in non-compounds. The same situation does not apply, however, with compound words, where an oral/nasal distinction is maintained before nasal or prenasalised consonants. Examples:

*ke-ñũ* 'pierce with the teeth'  
*kẽ-ñũ* 'pierce with the fingers'

(Moyses-Faurie – Néchéro-Jorédié 1986)

Table 2. Oral vowels

	Front	Central	Back
High	<i>i</i>	<i>ɨ</i>	<i>u</i>
Mid	<i>e</i>	<i>ə</i>	<i>o</i>
Mid	<i>ɛ</i>	<i>ʌ</i>	<i>ɔ</i>
Low		<i>a</i>	

Table 3. Nasal vowels

	Front	Central	Back
High	<i>ĩ</i>	<i>ĩ</i>	<i>ũ</i>
Mid	<i>ẽ</i>	<i>ã</i>	<i>õ</i>
Low		<i>ã</i>	

### 3. Morphology

#### 3.1 Personal pronouns

		Independent pronouns	Subject pronouns	Object pronouns	Possessive pronouns
Singular	1	<i>gu</i>	<i>nã</i>	<i>nã</i>	<i>-nã/-rã</i>
	2	<i>ge</i>	<i>ko</i>	<i>ro</i>	<i>-ro/-o</i>
	3	<i>nie</i>	<i>re/ε</i>	<i>ε</i>	<i>-re/-ε</i>
Dual	1 incl	<i>ũrũ</i>	<i>ũrũ</i>	<i>rũ</i>	<i>-rũ</i>
	1 excl	<i>ŋõ</i>	<i>ŋõ</i>	<i>ŋõ</i>	<i>-ŋõ</i>

	3	<i>nĩ</i>	<i>rĩ</i>	<i>rĩ</i>	<i>-rĩ</i>

#### 3.2 Principal affixes (not systematically translated in notes to the Lexicon)

<i>a-</i>	agentive prefix (singular)
<i>fa-</i>	causative prefix
<i>kẽ-</i>	nominalising prefix, ‘way, manner of’
<i>mẽ-</i>	prefix to certain stative verbs
<i>nε-</i>	nominalising prefix, ‘expanse of’
<i>nõ-</i>	‘top of’
<i>pa-</i>	agentive prefix (plural)

<i>pū-</i>	‘cause of, root of’
<i>i-</i>	nominalising prefix, ‘place of’ or generic state
<i>x<sup>w</sup>ā-</i>	nominalising prefix, ‘result of’
<i>-amε/-mε</i>	‘definitively, absolutely’
<i>-rε</i>	suffix to nouns with obligatory determiner when determiner not made explicit.

## 68. Nengone

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Darrell T. Tryon</i>
--

---

---

### 1. Introduction

---

---

Nengone is spoken on the island of Mare, the southernmost of the Loyalty Islands, some one hundred kilometres east of the mainland of New Caledonia. The Loyalty Islands are administratively part of New Caledonia. Nengone or Pene Nengone is spoken by the approximately 6,500 inhabitants of the island of Mare and by a varying number of Mare expatriates working in Noumea, the New Caledonian capital. There is little discernable dialect variation.

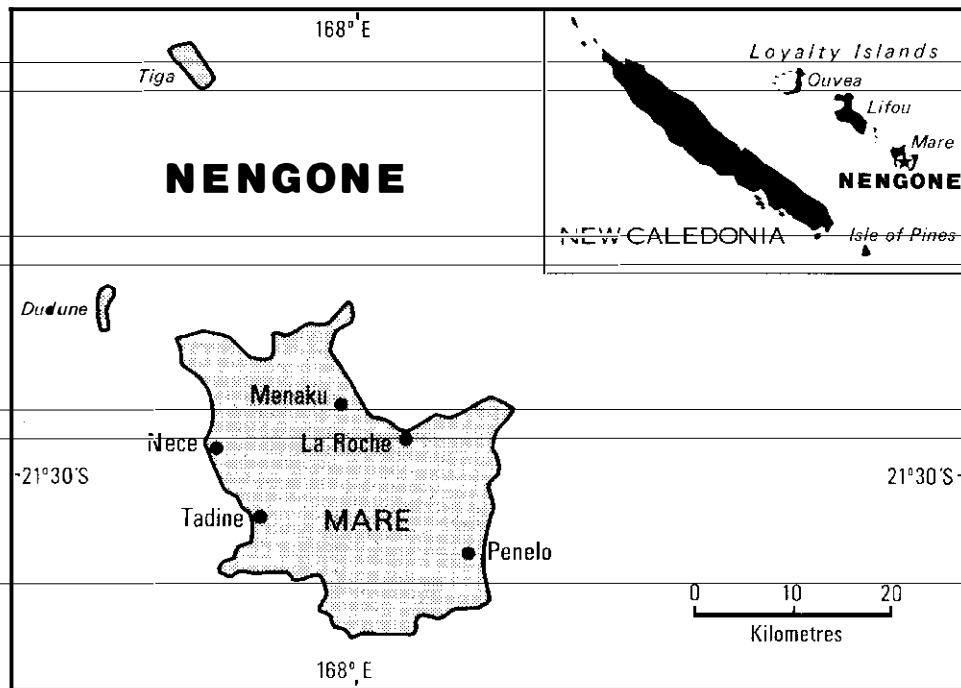

Mare has a surface area of 650 square kilometres (Dubois 1984). It is located at approximately 21° 31' S. lat. and 168° E. long.

The earliest studies of Nengone include wordlists by Turner (1847), and Inglis (1851), as well as the work of H.C. von der Gabelentz (1861). Also significant in the nineteenth century were Codrington (1885) and Mueller (1888). In 1903 the Bible (Anon 1903) was translated into Nengone by the British and Foreign Bible Society, and it was this which served as the basis of the account of Nengone which appears in Ray (1926). The first study of Nengone based on field study rather than published documents was that of Maurice Leenhardt (1946). This work also contains an extensive wordlist for Nengone, as indeed it does for all of the languages of New Caledonia and its dependencies. Later works devoted to Nengone include Tryon's (1967), and Tryon – Dubois (1969 and 1971). More recently Dubois (1984) has published an encyclopedic ethnography of the people of Mare which is rich in ethnocultural lexical material collected during Dubois' lengthy stays on the island between 1939 and 1967, as a missionary. The lexical material here presented in the comparative lexicon is taken mainly from the Nengone dictionary referred to above.

Nengone distinguishes three registers, namely *pene animac*, *pene egesho* and *pene iwateno*. *Pene animac* is the register used in everyday speech, while *pene egesho* is a register of insult and vulgarity, used especially in the heat of battle by warriors. A third register, the language of respect, an honorific register, is known as *pene iwateno*.

---

---

Map 68. Nengone language area

*Pene egesho* often reflects common Austronesian roots replaced in the language of everyday intercourse. Thus one has, for example *net* (POC \**mate*) ‘die, dead’, instead of *taŋo*, *wa-neč* (POC \**mata*) ‘eye’ instead of *waegogo*. There are also significant lexical differences between the common register and that used in honorific speech, reserved for communication with chieftains. One has, for example *wien* ‘good’ (*pene iwateno*), as opposed to the common register *roi*, *kođaru* ‘eat’ as opposed to *kaka*, *čanaeon* ‘hear’ as opposed to *taeđeni*. The differences between the three registers are very largely lexical, although *pene iwateno* is characterised by the use of honorific suffixes with both nouns and verbs. Compare, for example:

Pene Animac	Pene Iwateno	
<i>sibon</i>	<i>siboton</i>	‘ask’
<i>sian</i>	<i>siaton</i>	‘send’
<i>udi</i>	<i>uditon</i>	‘reject’

The differences between the common and the respectful register are also well exemplified in the following pronominal table:

	Common	Respectful
I	<i>inu</i>	<i>inuŋo</i>
you sg.	<i>bo</i>	<i>bua</i>
he/she	<i>bon</i>	<i>nuboneŋo</i>
we dl incl	<i>eθew</i>	<i>eθeweŋo</i>
we dl excl	<i>eŋe</i>	<i>eŋeŋo</i>
you dl	<i>ŋeŋo</i>	<i>bunjeŋo</i>
they dl	<i>bušeŋon</i>	<i>bušeŋoneŋo</i>
we pl incl	<i>eje</i>	<i>ejeŋo</i>
we pl excl	<i>eŋij</i>	<i>eŋijeŋo</i>
you pl	<i>bunij</i>	<i>bunijeŋo</i>
they pl	<i>buič</i>	<i>buičeŋo</i>

## 2. Phonology

The phonemes of Nengone are as follows:

*Table 1.* Consonants

	Bilabial	Dental/ Alveolar	Retroflex	Alveo- palatal	Velar	Glottal
Stops/Affricates:						
vl asp.	<i>p<sup>h</sup></i>	<i>t<sup>h</sup></i>		<i>ç<sup>h</sup></i>	<i>k<sup>h</sup></i>	
vl unasp.	<i>p</i>	<i>t</i>	<i>ɽ</i>	<i>ç</i>	<i>k</i>	<i>ʔ</i>
vd unasp.	<i>b</i>	<i>d</i>	<i>ɽ</i>	<i>ʃ</i>	<i>g</i>	
Fricatives:						
vl	<i>(f)</i>	<i>θ</i>	<i>s</i>	<i>ʃ</i>	<i>(x)</i>	<i>h</i>
vd			<i>z</i>		<i>ɣ</i>	
Nasals:						
vl	<i>ŋ</i>	<i>ŋ</i>			<i>ŋ</i>	
vd	<i>m</i>	<i>n</i>		<i>ɲ</i>	<i>ŋ</i>	
Laterals						
		<i>l</i>				
Vibrants						
		<i>r</i>				
Semivowels						
	<i>w</i>			<i>y</i>		
	<i>w</i>					

Note: the phonemes in parenthesis occur only in borrowings. Note also that a syllabic nasal occurs in one word in Nengone, namely *mma* [ɱa] ‘house’.

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid-high	<i>e ē</i>		<i>o ō</i>
Mid-low	<i>ɛ ē</i>		<i>ɔ ɔ̄</i>
Low		<i>a ā</i>	

Vowel length is phonemic in Nengone, thus producing a second vowel series. Nasality is not, however, phonemic, unlike the mainland New Caledonian languages. Utterance final vowels are devoiced.

## 2.1 Stress

Stress is non-phonemic in Nengone. In words of more than one syllable, primary stress falls on the penultimate. Secondary stress falls two syllables before the syllable bearing primary stress.

## 2.2 Phonotactics

### a) Syllable Structure:

A syllabic nucleus is always a vowel (V), which may be preceded or followed by any consonant (C), or both preceded or followed by C.

Examples:

V	<i>u</i>	'to cry'	<i>e</i>	'yes'
(C)V	<i>pa</i>	'grandfather'	<i>ke</i>	'to refuse'
V(C)	<i>al</i>	'to swim'	<i>un</i>	'breadfruit tree'
(C)V(C)	<i>len</i>	'road'	<i>wen</i>	'root'

### b) Word Structure:

A CVCV pattern predominates in Nengone word structure. No clusters of CC may occur, although VV and even VVV may. Examples of Nengone word structure:

V	<i>u</i>	'to cry'	<i>e</i>	'yes'
VV	<i>ia</i>	'animal'	<i>ue</i>	'high tide'
CV	<i>lo</i>	'there'	<i>da</i>	'blood'

VC	<i>al</i>	'to swim'	<i>ač</i>	'thing'
CVC	<i>ŋom</i>	'man'	<i>woč</i>	'bush forest'
VCV	<i>ele</i>	'rain'	<i>ore</i>	'morning'
VVV	<i>aea</i>	'fish trap'	<i>aeo</i>	'food dish'
CVV	<i>peu</i>	'to weed'	<i>leu</i>	'to follow'
VVC	<i>eoč</i>	'shark'	<i>eak</i>	'west'
CVCV	<i>moma</i>	'old man'	<i>wata</i>	'leg'
CVVC	<i>yeuč</i>	'octopus'	<i>θaet</i>	'to sleep'
VCVV	<i>ađai</i>	'flying fox'	<i>aθoe</i>	'to light fire'
VVCV	<i>iεke</i>	'crab sp'	<i>aiča</i>	'young boy'
CVCVC	<i>čaŋan</i>	'man'	<i>wanin</i>	'arm'
CVVCV	<i>deiče</i>	'to wink'	<i>čuada</i>	'thumb'
VCVCV	<i>εɛnu</i>	'stalk'	<i>ekone</i>	'to marry'
CVCVV	<i>maduo</i>	'to the west'	<i>nodei</i>	'all'

Restrictions on phoneme occurrence: /s, z, ɣ and ʔ/ together with the /m̥ n̥ ŋ/ and also, /ñ and y/ do not occur word finally. /ʔ and ŋ/ do not occur word initially.

Wherever two consonants come together, one word-final and the other word-initial, an epenthetic vowel /e/ is inserted. Thus:

*buič-e či ule* 'they see'.

### 3. Morphosyntax

#### 3.1 Word order

The basic word order in Nengone is SVO, although with noun subjects the order is commonly VSO, as with a number of other languages in southern Melanesia, including Aneityum (Vanuatu) and the Fijian languages.

Examples:

*inu čo ridi bo*  
I fut hit you sg

'I shall hit you.'

*buič ome či kayo eŋiʃ wenore či pina kore pauteut*  
they here pres call us because pres arrive det cyclone

'They call us here because a cyclone is coming.'

### 3.2 Basic morphology

#### a) Tense/aspect markers:

<i>či</i>	present
<i>čo</i>	future
<i>ṅə</i>	completed action
<i>ha ṅa</i>	past state
<i>ha</i>	present state
<i>θu</i>	habitual
<i>deko</i>	negative

#### Examples:

*inu deko čo kaka*  
 I neg fut eat  
 'I shall not eat.'

*bone ha taŋo ṅen ore du*  
 he state die agent det sun  
 'He was killed by the sun.'

#### Other Functors/Formatives:

<i>ṅei</i> + Noun Head	agent/instrument
<i>ṅen ore</i> + Noun Head	agent/instrument
<i>bane so/so</i>	benefactive
<i>a-Verb-ni</i>	causative
<i>e-Verb-keu</i>	reciprocal
<i>yara</i> -Num	multiplicative
<i>ṅa</i> + Verb	noun, nominaliser
adjective + <i>?il</i>	abstract noun

#### Examples:

*bone ha taŋo ṅen ore retok*  
 he state die agent det chief  
 'He was killed by the chief.'

*inu čo ruaban ore mma bane so bon*  
 I fut clean det house ben him/her  
 'I shall clean the house for her.'

*taŋo* 'die'  
*a-taŋo-ni* 'kill'  
*kečon* 'hate'

<i>e-kečo-keu</i>	‘hate one another’
<i>rewe</i>	‘two’
<i>yara-rewe</i>	‘twice’
<i>meneŋ</i>	‘stay’
<i>ŋa-meneŋ</i>	‘house’
<i>ma</i>	‘big’
<i>ma-ʔii</i>	‘size’

## 69. Kiribati

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Sheldon P. Harrison</i>
---

---

---

### 1. Micronesian languages: some general observations about the family

---

#### 1.1 Location

Until recent historical times, Micronesian-speaking peoples lived exclusively in three island groups in the central Pacific; the Gilbert Islands (Kiribati), the Marshall Islands and the Caroline Islands.<sup>1</sup> While the Gilberts and the Marshalls are exclusively Micronesian, there are non-Micronesian populations in the Carolines. Polynesian languages are spoken on the islands of Nukuoro and Kapingamarangi in the eastern Carolines, and Yapese and Palauan on islands in the west. The original Micronesian domain has been extended through more recent migrations. In the last century, migrants from the central Carolines (principally Satawal and Puluwat) settled on the island of Saipan in the northern Marianas. Their descendents, speaking a language usually called Saipan Carolinian, now share that island with the indigenous Chamorro-speaking population. In the present century, resettlement schemes sponsored by the British colonial administration have resulted in the establishment of Kiribati-speaking communities in the Line Islands (particularly on Christmas Island), on the islands of Gizo and Wagina in the Solomons, and on Rabi in Fiji.

---

---

#### 1.2 Internal genetic relations

As might be expected, the nature of the internal relationships holding amongst the languages of Micronesia is a matter of some debate. A conservative view would allow six first order subgroups (see Figure 1). Four of these are single-language branches: Kiribati, Marshallese, Nauruan, and Kosraean. The Ponapeic branch is now held to comprise three languages;

---

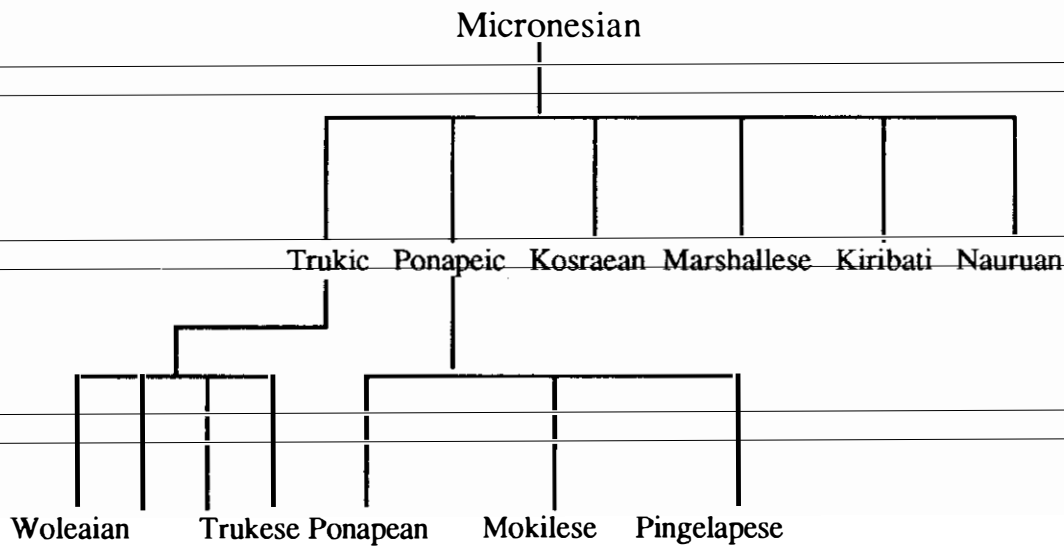

---

---

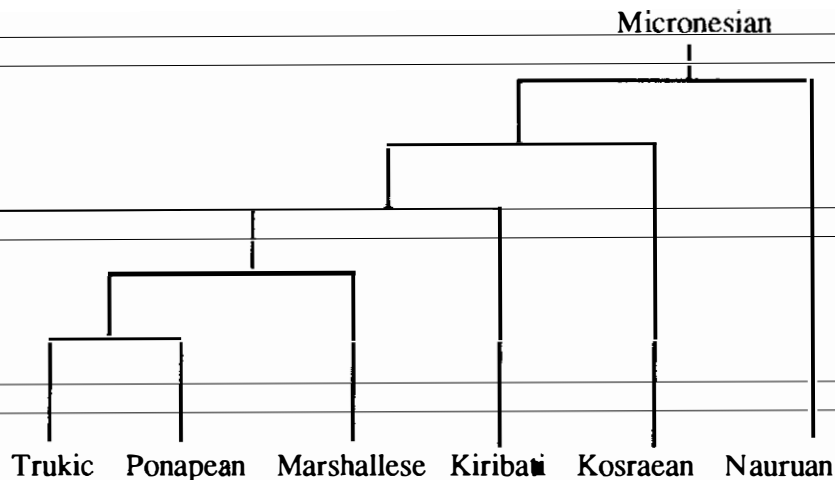

1. Nauru and Bwaanaba, to the west of the southern Gilberts, are perhaps not geographically a part of any of these island groups.

---

---

*Figure 1.* Micronesian subgrouping: a shallow (conservative) view

*Figure 2.* Micronesian subgrouping: after Jackson (1983)

Ponapean, Pingelapese, and Mokilese, previously reported (for example, in Garvin 1949) as dialects of a single language. These languages are quite closely related. Mokilese and Pingelapese are mutually intelligible, as by all reports are Pingelapese and Ponapean. Mokilese and Ponapean are not mutually intelligible, however. The language of the island of Ngatik is regarded as a dialect of Ponapean. There has been no detailed study of Ngatikese, however. The internal relationships of the Trukic languages are more complex than the Ponapeic, if for no other reason than that those

languages are spoken on a larger number of islands in a wider area. Quackenbush (1968) termed Trukic a dialect continuum. More recent studies, particularly that of Jackson (1983), have attempted to put some structure on that continuum. I choose not to enter that debate, and hence will not attempt to put a cardinality on the Trukic languages.

There have been some attempts to argue for more inclusive higher order subgroups within Micronesian (see Figure 2).<sup>1</sup> The one most often noted is a putative Trukic-Ponapeic subgroup. I have speculated (Harrison 1977, 1978), largely on grammatical grounds, on a Ponapeic-Kosraean subgroup, and have recently begun to wonder about a Marshallese-Kiribati subgroup. There is so little detailed information available regarding Nauruan that it seldom intrudes into discussions of internal Micronesian subgrouping.

### 1.3 External genetic relations

The Micronesian language family is a subgroup of the Oceanic branch of the Austronesian language family. Its position within Oceanic is unclear. Grace (1955) tentatively puts Micronesian in his Oceanic Group 4, which Pawley (1972), following Biggs, recast as Eastern Oceanic. The position of Micronesian in a subsequent revision of Eastern Oceanic (Pawley 1977) is unclear. These issues are considered in detail in Jackson (1986).

### 1.4 External influences (non-Oceanic)

The colonial history of the Micronesian peoples is as varied and complex of any in the Pacific. The Caroline Islands were nominally a Spanish possession from the sixteenth century. They were largely ignored by the Spanish administration in the Philippines and the Marianas until the late nineteenth century, when Germany began to show some official interest in the area. The cultural and linguistic impact of the Spanish administration on the Carolines was not particularly strong, and was minimal except on the larger high islands. Spain sold its remaining Micronesian interests to Germany in 1899, following its defeat in the Spanish-American War.

German traders began to work in Micronesia around 1870. In 1885, in order to safeguard its trade, the German government established a protectorate over the Marshall Islands. The government did not take over the administration of the Marshalls and Nauru from commercial interests until 1906, however. German linguistic influence on the languages of Micronesia

1. The most detailed discussion is in Jackson (1983, 1986).

was much less significant than that of English, even, it would appear, during the period of German administration.

After World War I, Japan obtained a League of Nations mandate over all former German Micronesian territory except Nauru (which was administered by Australia until independence in 1968). The Japanese administration was pervasive and, consequently, had a strong linguistic impact throughout the Carolines and the Marshalls, as evidenced by the large number of Japanese borrowings in the wordlists to follow.

English-speaking colonial powers were relative latecomers to Micronesia. As already noted, Nauru was officially administered by Australia for some fifty years. The Gilbert Islands (Kiribati) became a British protectorate in 1892 and a colony in 1916. Except for a short period of Japanese occupation during World War II, they were administered by Britain until independence in 1979. The United States took over former Japanese possessions in Micronesia in 1945.

The linguistic influence of English antedates direct political control by up to a century in some areas, however. American missionaries and whalers entered Micronesia in the Spanish period, and had more direct cultural contact with the people than did the Spanish or German colonial administrations. This covert American influence continued until Japan closed its new Micronesian possessions to foreigners. (I might also note that British companies worked the phosphate mines on Nauru even while that island was officially German, and that English appears to have been the lingua franca of the mines.) As a result, there are more English loanwords in all Micronesian languages than loans from any other non-Oceanic source. That influence still continues.

### **1.5 External influences (Oceanic)**

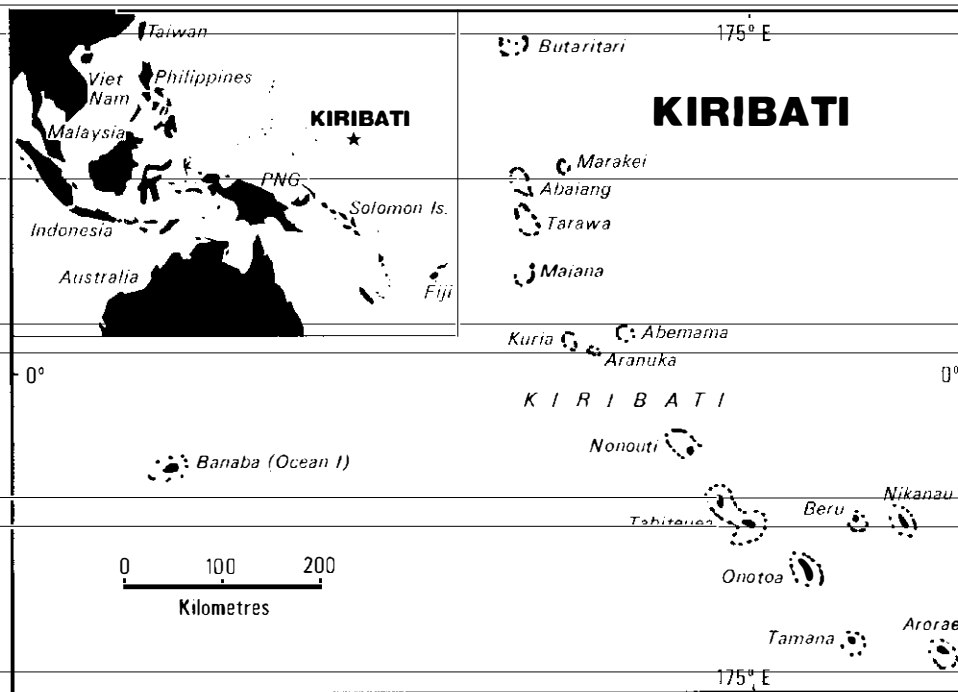

The identification of lexical borrowings from other Micronesian languages<sup>1</sup> (and from other non-Micronesian Austronesian languages) is a more challenging exercise than the identification of English or Japanese borrowings. In the wordlists that follow, I have identified such items when etymological information was given in the sources or, in some cases, when other relevant evidence was available to me. There is a substantial Polynesian adstratum in Kiribati (considered in Harrison 1992), the result of a Polynesian invasion some five hundred years ago. Kiribati, in turn, has

---

1. See Rehg – Bender (1990) for a detailed consideration of one such case.

contributed a number of items to other Micronesian languages, particularly Marshallese (see Bender 1981 for some discussion).<sup>1</sup>

In the Caroline Islands, the usual pattern of borrowing is from languages of larger high islands to those of surrounding atolls. Thus, Mokilese has been heavily influenced by Ponapean, and Woleaian by Yapese. (In pre-contact times, chiefs on the island of Yap had established a tribute network, the Yap Empire, stretching almost as far east as the Truk lagoon.) Centralised colonial and post-colonial administrations have increased the influence of these larger high islands.

Map 69. Kiribati language area

## 1.6 The languages of this study

My choice of languages in this comparative study was directed by three considerations; representativeness, quality of available information, and demographic-political significance. I selected one language each from the Ponapeic and the Trukic subgroups. Ponapean was the obvious choice in

1. Though Mokilese data was not used in the present study, I might note the heavy Marshallese lexical influence on that language, probably as a result of drift voyages within the last two centuries.

the case of Ponapeic,<sup>1</sup> by virtue of both number of speakers and political status. For those same reasons, Lagoon Trukese should have been the representative of the Trukic branch. Unfortunately, though there is a substantial Trukese-English dictionary (Goodenough – Sugita 1980), I have no access to Trukese data organised by the English gloss. My choice of the western Trukic language Woleaian was thus motivated by availability of data.

There were four choices for the remaining two languages. Nauruan was immediately discounted because I have no substantial lexical information from that language. Kiribati was an immediate choice because I have worked on the language myself. My choice of Marshallese, rather than Kosraean, as the fourth language was rather arbitrary. I might justify it on the grounds that more non-Micronesians are likely to have heard of Marshallese than of Kosraean and that the available Marshallese lexical information is more detailed than the Kosraean.

## 2. Kiribati demography and dialects

With upwards of 60,000 speakers, Kiribati is the most populous of the Micronesian languages. Its traditional (pre-contact) speech area comprises the Gilbert Islands (Kiribati) and the island of Bwaanaba,<sup>2</sup> now parts of the Republic of Kiribati, and the island of Niu in the Ellice Islands (now Tuvalu). As a result of recent resettlements, Kiribati is also spoken on the islands of Gizo and Wagina (Solomon Islands), Rabi (Fiji), and the Line Islands (Kiribati). Kiribati is also widely understood on Nauru, as a side-effect of the size of the Kiribati migrant labour force on that island.

There are three recognisable dialects of Kiribati (excluding Bwaanaba). The most divergent is the Northern dialect, spoken on the islands of Butaritari and Mwakin. The boundary between Central and Southern dialects is the equator. I have only included dialect information in the Kiribati data in a few cases, because of the published sources employed for Kiribati, only Sabatier (1971) gives dialect information, and then only rarely. Most of the speakers I have worked with are from the southern dialect.

1. Rather than Mokilese, with which I am more familiar.
2. Though many Bwaanabans have felt it politically necessary to assert that their language is *not* Gilbertese, my limited experience with Bwaanaban leads to the conclusion that it is no more than dialectally distinct from the speech of the Gilbert Islands.

### 3. Phonology

Kiribati has a small phonemic inventory, small both by Micronesian and by world standards:

Table 1. Consonants

	Labialised labial	Labial	Apical	Velar
Stops	<i>b<sup>w</sup></i>	<i>b</i>	<i>t</i> <sup>1</sup>	<i>k</i>
Nasals <sup>2</sup>	<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>	<i>ŋ</i>
Flaps			<i>r</i>	
Semivowels	<i>w</i>			

Table 2. Vowels<sup>3</sup>

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Three features of the Kiribati practical orthography (not used in this volume) are not standardised, namely the representation of long vowels, the representation of velarised labial consonants, and word division. There are two competing representations for long vowels, either as a double vowel or as a single vowel with a macron.<sup>4</sup> I adopt the latter convention. Velarised and non-velarised labials contrast in Kiribati before unround vowels. Before non-low vowels, the velarised labials are consistently represented as *b<sup>w</sup>* and

1. /t/ is realised as [s] before high vowels in Northern and Central dialects, and before the high front vowel in the Southern dialect. In the southern dialect, /t/ before /u/ varies between an apical stop and a post-alveolar affricate.
2. All Kiribati nasal consonants can occur geminate. Geminate consonants are represented as double consonants orthographically. There is no standard representation for geminate digraphs. Here, I represent geminate *ŋ* as *ŋŋ* and geminate *m<sup>w</sup>* as *mm<sup>w</sup>*.
3. Kiribati vowels are either short or long; long vowels are written with a macron.
4. More often than not, long vowels are simply not distinguished from short vowels. The same is true of velarised and non-velarisation consonants before *a* (see below).

*m*<sup>w</sup>. I use the same convention before the low vowel also, though many writers use *b'* and *m'* in that context.<sup>1</sup>

The only consonant clusters tolerated in Kiribati are NC clusters, homorganic if N is apical or velar, though not necessarily if N is labial:

<i>mka</i>	'rubbish'
<i>mtamta</i>	'dribble'

Syllables may be closed by a nasal consonant:

<i>nim</i>	'drink s.th.'
<i>rān</i>	'fresh water'
<i>kaŋ</i>	'eat s.th. (pl)'
<i>kam</i> <sup>w</sup>	'2sg subject marker'

In sandhi before a consonant, an epenthetic /i/ appears if the resulting cluster would not be permitted:

<i>kantaua</i>	'want to hold s.th.'
<i>kanimōi</i>	'want to drink'

Before a non-high vowel, such nasals are phonetically geminate; before a high vowel, they trigger lengthening:

<i>kanorea</i>	'want to hit s.th.'	[kannorea]
<i>kanira</i>	'want to follow s.th.'	[kanīra]

Long sequences of vowels are characteristic of Kiribati canonical shape; the only constraint governing such sequences is that tautosyllabic sequences must be of strictly decreasing sonority:

<i>aiaia</i>	'their enemies'
<i>kuia</i>	'driftwood'
<i>aei</i>	'this'
<i>aoi</i>	'dew'

The first of two adjacent vowels of the same height assimilates (variably) to the second, as in:

1. Velarised consonants are strongly labialised before non-low vowels, hence the two different representations. The Protestant missionaries who first designed the Kiribati orthography probably did not recognise that the labialised and non-labialised velarised labials were in any sense the same.

<i>natiu</i>	‘my child’	>	<i>natū</i>
<i>ŋkoe</i>	‘2sg independent pronoun’	>	<i>ŋkē</i>
<i>oreia</i> <sup>1</sup>	‘hit him/her/it’	>	<i>oroia</i>

But:

<i>orea</i>	‘hit s.th.’	>	* <i>oroa</i>
<i>beo</i>	‘jumbled’		
<i>bō</i>	‘in contact’		

### 3.1 Mora count constraints in Kiribati

Two phonosyntactic constraints on mora count influence the canonical shape of Kiribati words. The two mora constraint is a constraint that no item belonging to the major categories NOUN or VERB can have fewer than two morae (where each vowel and coda nasal counts one mora). Thus, while there are minor category items such as:

<i>b<sup>w</sup>a</i>	‘that, because’
<i>ke</i>	‘2sg subject marker’

major category items with the same segments must have a long vowel:

<i>b<sup>w</sup>ā</i>	‘oil (for lamps)’
<i>kō</i>	‘closed, tight, compacted’

The net effect of the two mora constraint is that all open monosyllabic nouns and verbs have a long vowel.

The three mora constraint is a constraint that phrases projected from nouns or verbs have a minimum of three morae.<sup>2</sup> The net effect of the three mora constraint is that the first mora of a bimoric noun or verb is long if that mora is vocalic and if the item constitutes a minimal phrase:

<i>te ben</i>	‘a ripe coconut’
<i>bēn</i>	‘ripe coconuts’
<i>i biri</i>	‘I ran’
<i>hīri</i>	‘run!’

Geminate and syllabic nasals contribute a mora, and hence obviate lengthening:

1. There are instances of mid-vowel assimilation over an intervening consonant.
2. A more precise stipulation of the syntactic domain of the three mora constraint is beyond the scope of this introduction.

<i>nna</i>	‘fleet’
<i>mka</i>	‘rubbish’

I might point out that the three mora constraint is vacuous for open monosyllables, since overlong (3 mora) vowels are not permitted.

#### 4. Some grammatical observations

##### 4.1 Nominal possession

As in all Micronesian languages, possession in Kiribati is marked by suffixes indexing the person and number of the possessor. With many nouns (for example, names of body parts or kinship terms) these suffixes appear on the possessed noun itself:

*Table 3.* Possessive paradigm for *te tama* ‘father’

	Singular	Plural
1st	<i>tamau</i>	<i>tamara</i> <sup>1</sup>
2nd	<i>tamam</i>	<i>tamamī</i>
3rd	<i>tamana</i>	<i>tamaia</i>
Construct <sup>2</sup>	<i>taman</i>	

With others, they are affixed to the possessive article:<sup>3</sup>

<i>ana auti</i>	‘his/her house’
<i>au kāwa</i>	‘my village’
<i>ana utū te ataei</i>	‘the child’s family’

Note that the possessive article has no construct form.

##### 4.2 The nominal article *te*

Common nouns in Kiribati are cited with the common article *te*. This decision was taken for two reasons; first, because that is how the Kiribati

1. Along with Kosraean, Kiribati has lost the inclusive/exclusive pronominal contrast. Only the historical inclusive forms survive in Kiribati. Kosraean has retained many of the formal contrasts, though not their historical functions.
2. Suffix-possessed nouns in all Micronesian languages have a construct form (a reflex of PMC *\*-ni*), used with NP possessors. In Kiribati, the construct is not used with plural human noun phrase possessors.
3. The Kiribati possessive article is cognate with the general possessive classifier (PMC *\*a-*) of other Micronesian languages. Unique amongst Micronesian languages, Kiribati has no possessive classifier system.

themselves cite common nouns and, second, as a consequence of the morphophonemics of Kiribati, the form obtained by removing the article is in many cases not an extant free form. The simplest solution to this problem was to include the article with all common nouns.

### 4.3 Relational nouns

The category preposition is usually very small in Micronesian languages. In most instances, translation equivalents of English prepositions are nouns, often termed relational nouns in grammars of Micronesian languages and typically suffix-possessed. In Kiribati, most such nouns have both relational and non-relational functions; in the former they take the prefix *i-*, for example, *aona* ‘its surface, its top’ *iaona* ‘on it’.

### 4.4 Verb transitivity

Most verbs in Micronesian languages have both transitive and intransitive forms. In Kiribati, formally transitive verbs have a nine-member paradigm. The following exemplifies the most common (consonant stem) paradigm class:

Table 4. Transitive paradigm for *nōra* ‘see s.th.’

	Singular		Plural
1st	<i>nōrai</i>		<i>nōrīra</i>
2nd	<i>nōriko</i>		<i>nōriŋkamī</i>
3rd	<i>nōria</i>	ANIM	<i>nōrīa</i>
Nominal	<i>nōra</i>	INAN	<i>nōrī</i>
Passive		<i>nōraki</i>	

Intransitive forms of transitive verbs can be formed notionally from transitive forms by removing the transitive suffix and a stem-final consonant, if any. The resulting root is, in some cases, reduplicated:

<i>nō</i>	‘to see’
<i>nora</i>	‘to see s.th.’
<i>oto</i>	‘broken’
<i>otea</i>	‘to break s.th.’

Kiribati verbs are cited in their (nominal) transitive form, if there is one. Motion verbs, statives, and verbs naming bodily functions are cited in their intransitive form, however.

#### 4.5 Reduplication

Reduplication is a productive derivational and/or inflectional device in all Micronesian languages, particularly in their verbal systems. The grammar of reduplication in Kiribati is far too complex to consider here. Some information on the form and derivational functions of reduplication in Kiribati can be found in Groves et al. (1985). For a general discussion of Micronesian reduplication, see Harrison (1973).<sup>1</sup> (See also the notes for Marshallese, below.)

I have cited items in their unreduplicated form in all cases, unless the only form extant is reduplicated.

#### 4.6 Numerals and Classifiers

Like all Micronesian languages but Marshallese, Kiribati has a highly elaborated numeral classifier system, as well as a set of (in Kiribati, rarely used) serial counting numerals. Kiribati numerals are cited with the general counting classifier, Kiribati *-ua* (a reflex of PMC *\*-ua*).

#### 4.7 Derivation

All Micronesian languages have a rich derivational morphology, involving prefixation, suffixation, compounding, and reduplication. The most frequent derivational prefix in all Micronesian languages is the causative, a reflex of PMC *\*ka-*:

<i>māku</i>	‘afraid’
<i>kakamāku</i>	‘frightening’
<i>mate</i>	‘dead’
<i>kamatea</i>	‘to kill s.th.’
<i>ure</i>	‘open (of eyes)’
<i>kaurea</i>	‘to open (of eyes)’

1. That study, unfortunately, was completed before I had done any work on Kiribati. As a result, information on reduplication in Kiribati presented there is fragmentary.

The only other fully productive prefix in Kiribati is *I-* 'person from', deriving nationality names from place names:

<i>I-Kiribati</i>	'Kiribati'
<i>I-Aotiteria</i>	'Australian'

Other prefixes include: *i-* and *-ai* 'reciprocal', *ta-* 'barely, not quite', and *ni-* 'full of, characterised by', all of which have cognates in other Micronesian languages.

Most derivational suffixes in Kiribati function in the verbal transitivity system, deriving transitive verbs from nouns or from intransitive verbs. The most productive are *-na*:

<i>tamana</i>	'to regard s.o. as a father'
<i>maekana</i>	'to dwell in' (cf. <i>maeka</i> 'to dwell')

and *-akina*:

<i>ɲareakina</i>	'to laugh at s.th.'	(< <i>ɲare</i> 'to laugh')
<i>bōrauakina</i>	'to sail to'	(< <i>bōrau</i> 'to navigate')

## 5. Bibliography

Kiribati lexical data are drawn from Sabatier (1971), Eastman (1948), and from my own field notes and text material. (I have not drawn on Bingham 1908.) Grammatical surveys can be found in Cowell (1951) and Groves et al. (1985). Neither of those two published sources is completely reliable with respect to the contrast between long and short vowels and between labialised and non-labialised labial consonants before low vowels. I can only attest to the representations given in the case of those items with which I am personally familiar. I might point out that Eastman's work gives Kiribati renderings of selected English items. Those renderings are often more paraphrases than translation equivalents. I have attempted to eliminate any obvious cases of that sort.

## 70. Marshallese

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Sheldon P. Harrison</i>
---

---

---

### 1. Demography and dialects

---

---

Marshallese is spoken by the approximately 23,000 inhabitants of the Republic of the Marshall Islands, comprising two parallel chains of islands oriented roughly north-west to south-east. In Marshallese, these chains are termed Ratak, the eastern islands, and Rālik, the western islands. They constitute the major dialect division in Marshallese. The differences between the two dialects are for the most part lexical.<sup>1</sup> The one major non-lexical difference is in the realisation of what are phonemically geminate initial consonants. In both dialects, such consonants are resolved by means of an insert vowel, high or mid depending on whether the following vowel is high or non-high, respectively. In the Rālik, the insert vowel is a prothetic front vowel, agreeing in height with the following vowel.<sup>2</sup> In the Ratak, it is an epenthetic vowel whose height is determined as in the Rālik dialect, but which is front if the geminate is light, central if it is heavy, and rounded if it is rounded:

<i>ppij</i>	‘skilled in jumping’	<i>llor</i>	‘shade, shadow’
<i>ippij</i>		<i>ellor</i>	
<i>pipij</i>		<i>lelor</i>	
<i>ttil</i>	‘burn’	<i>kkot</i>	‘strong, high in capacity’
<i>ittil</i>		<i>ekkot</i>	
<i>ūūi</i>		<i>kōkoi</i>	

---

---

### 2. Phonology

---

---

The Marshallese dictionary by Abo et al. (1976) uses an orthography which is a compromise between traditional orthographic practice and recommendations following from Bender’s (1968) phonemic analysis of Marshallese.

---

---

1. Dialectal alternates are given below when that information was available in Abo et al. (1976).
  2. Except that the prothetic vowel is (lower) mid if the following vowel is low.
- 
-

However, the wordlist in this volume follows the practice of using a classical phonemic orthography.

## 2.1 Consonants

*Table 1. Consonants*

	Labialised bilabial	Bilabial	Dental	Retroflex	Lab. retroflex	Palatal	Velar	Lab. velar
Stops	$p^w$	$p$	$t$			$c$	$k$	$k^w$
Nasals	$m^w$	$m$	$n$	$\eta$	$\eta^w$		$\eta$	$\eta^w$
Laterals			$l$	$l$	$l^w$			
Trills			$r$	$r$	$r^w$			
Glides						$y$		$w$

Bender's phonemic analysis recognises three series of consonants; a palatalised (or light) series, a velarised (or heavy) series, and a labiovelarised (or round) series. Only the light and heavy consonants are distinguished consistently in the practical orthography. The heavy consonant symbols are often used for rounded consonants, whose rounding is indicated by an adjacent round vowel or, preceding an unrounded vowel, by a following  $w$ .

Bender's series, using the orthography of the present work, are as follows. The symbol  $\bar{r}$  indicates an unrounded vowel, and the symbol “~” marks complementary distribution.

*Table 2. Bender's analysis (1968)*

		Light	Heavy	Round
Stops	bilabial	$p$	$p^w \sim p^w/\bar{r}$	-
	apical	$c$	$t$	-
	velar	-	$k$	$k^w/\bar{r}$
Nasals	bilabial	$m$	$m^w \sim m^w/\bar{r}$	-
	apical	$n$	$\eta$	$\eta^w/\bar{r}$
	velar	-	$\eta$	$\eta^w/\bar{r}$
Laterals		$l$	$l$	$l^w/\bar{r}$
Trills		$r$	$r$	$r^w/\bar{r}$
Glides		$y$	-	$w$

“Light” consonants tend to be palatalised before non-front vowels, and “heavy” bilabials to be labialised before front vowels.

Stops tend to be voiceless initially and finally but voiced intervocalically (Zewen 1977: 21-24).

## 2.2 Vowels

Though the Marshallese orthographic tradition recognises eighteen distinct vowels (in terms of height, backness, and length – see Table 3), Bender (1968) regards only vowel height as distinctive. In his phonemicisation, there are, therefore, only three<sup>1</sup> vowels: a high vowel, a mid vowel, and a low vowel (represented as /i/, /e/, and /a/, respectively). However, in the orthography of the wordlist, the vowels are:

Table 3. Vowels

	Front	Central	Back
High	<i>i</i>	<i>ɨ</i>	<i>u</i>
Mid-high	<i>e</i>	<i>ə</i>	<i>o</i>
Mid-low	<i>ɛ</i>	<i>ʌ</i>	<i>ɔ</i>
Low	<i>æ</i>	<i>a</i>	<i>ɒ</i>

Vowels are both long and short.

In classical phonemic terms, the two sets of mid vowels are clearly distinct, though that contrast is not represented in the practical orthography:

### Practical orthography

<i>ke</i>	‘porpoise’	[ke]
<i>ke</i>	‘when’	[kɛ]
<i>aō</i>	‘mine’	[aə]
<i>aō</i>	‘swim’	[aʌ]
<i>to</i>	‘get off’	[to]
<i>to</i>	‘rope’	[tɔ]

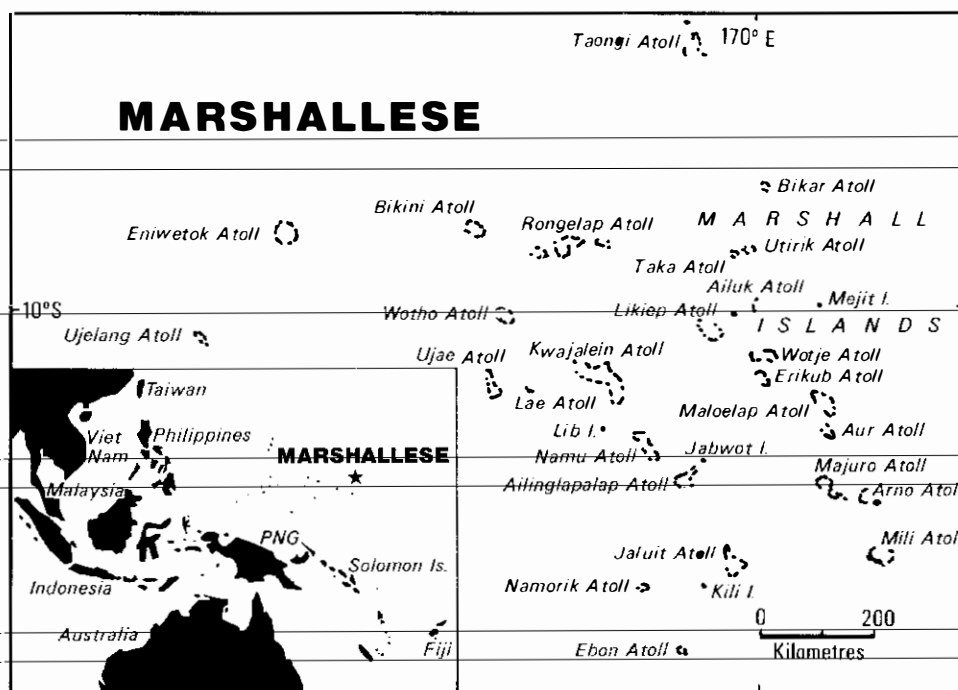

Adjacent lower mid and high vowels (phonemic /ɛGi/, where G is a glide) are not permitted in Marshallese. If such cases arise in (word-internal or -external) sandhi, the lower mid vowel becomes higher mid. Sequences of the form

1. There is, in fact, a fourth (upper mid) vowel series, phonetically between high and mid--see below.

/εCa/, where C is not a glide, are similarly proscribed. Such sequences are realised as /εCa/.

Affixes with a lower mid vowel, such as the subject prefix ε- ‘3sg’ or the transitive suffix -ε, are realised with a higher-mid vowel if the leftmost following (for prefixes) or rightmost preceding vowel (for suffixes) is higher mid.

Map 70. Marshallese language area

### 3. Grammatical notes

#### 3.1 Noun Morphology

Except for the shape of the possessive paradigm, the Marshallese nominal possessive marking system is similar to that of Ponapean. Suffix-possessed nouns and possessive classifiers have an seven-member paradigm, as exemplified by *cema-* ‘father’ (a short *a*-stem paradigm):

	Singular <sup>1</sup>	Plural
1 excl	<i>cemār</i>	
1 incl	<i>cema</i>	<i>cemām</i>
2nd	<i>cemam<sup>w</sup></i>	<i>cemāmi</i>
3rd/const	<i>cemān</i>	<i>cemāç</i>

The construct (< PMC *\*-ni*) and the third person singular (< PMC *\*-na*) forms of the possessive paradigm have fallen together in Marshallese. Marshallese suffix-possessed nouns are cited in their unsuffixed form, if there is one, and in the 3sg/CONSTRUCT form otherwise. As in Ponapean, Marshallese classifier-possessed nouns have a construct form (*-in* if the root is consonant-final, and *-Vn* if the root is vowel-final).

Unlike other Micronesian languages, there is no synchronic numeral classifier system in Marshallese.

### 3.2 Transitive verbs and transitive verb morphology

The transitive paradigm in Marshallese has at most three forms: a  $\emptyset$ -form used with an overt (nominal or pronominal) object, an *e*-form used i) as a third singular anaphoric object form or ii) optionally, in the same contexts as the  $\emptyset$ -form, and an *i*-form used with third plural nonhuman (expressed or unexpressed) objects:

<i>rejōt</i>	‘to slap s.th.’
<i>rejōte</i>	‘to slap s.th./him/her’
<i>rejōti</i>	‘to slap (them [nonhuman])’

A few verbs have a cognate of the Kiribati passive form in *-aki*. In Marshallese, these are considered derived intransitive perfective forms. For example:

<i>pinec</i>	‘to conceal s.th.’
<i>pencak</i>	‘hidden, concealed’

Bender initially divides transitive verbs in Marshallese into two broad classes, which he terms strong and weak. The weak is the productive class. Regular weak verbs are derived from stems that are consonant-final, where that

1. Marshallese suffix-possessed nouns belong to one of four paradigm classes. The remaining three are long *a*-stems, *e*-stems, and *i*-stems.

consonant is preceded by a non-high vowel. They have the three forms described above. Weak high verbs are those regular weak verbs whose last vowel is high. Weak thematic verbs are derived from vowel-final roots by means of the suffix *-ik*:

<i>eɒ</i>	‘tattoo’
<i>eɒuk</i>	‘tattoo s.o.’
<i>kaū</i>	‘pout’
<i>kaūuk</i>	‘to make faces at s.o.’

Weak high and weak thematic verbs have only a  $\emptyset$ - and an *i*-form, the latter used with all anaphoric (unexpressed) objects.  $\emptyset$ - and *i*-forms alternate in other environments.

The derivational relationship between strong transitive verbs and their intransitive counterparts is non-productive and, in general, less transparent. The strong thematic verbs are parallel to the thematic verbs of other Micronesian languages, in that the transitive form (in most cases) preserves a historical root-final *V(C)* lost in the corresponding intransitive forms:

<i>reŋōt</i>	‘to slap s.th.’
<i>reŋren</i>	‘to slap’
<i>micit</i>	‘to cut s.th.’
<i>m<sup>w</sup>icm<sup>w</sup>ic</i>	‘to cut’

The paradigms for these verbs parallel the weak thematic and weak high verbs. (Note that for some strong thematic verbs, the “thematic material” is present in both transitive and intransitive forms:

<i>kar</i>	‘to throw s.th.’
<i>karkar</i>	‘to throw’

Strong high verbs are a synchronic reflex of a class of (non-high) vowel-final roots whose preceding vowel was (reanalysed as) high:

<i>p<sup>w</sup>ine</i>	‘to count s.th.’
<i>p<sup>w</sup>enp<sup>w</sup>en</i>	‘to count’
<i>āmice</i>	‘to mourn s.o.’
<i>āmec</i>	‘to mourn’

Strong high verbs have no  $\emptyset$ -form, but have both *e*- and *i*-forms.

The strong zero class has only six members. Five are *Ce* monosyllables. Three of these (*ce* ‘to write s.th.’, *me* ‘to chew s.th.’, and *k<sup>w</sup>e* ‘to scratch

### 3.5 Reduplication

Marshallese employs initial or final CVC reduplication and/or initial consonant gemination in a variety of (largely derivational) functions. -CVC# reduplication is used in denominal verb derivation:

<i>kaṇūr</i>	‘belt’
<i>kaṇūrṇūr</i>	‘to wear a belt’
<i>p<sup>w</sup>aat</i>	‘smoke’
<i>p<sup>w</sup>aatat</i>	‘to smoke’

and, often with initial gemination or #CVC reduplication, in the derivation of what Bender (1971: 453) calls distributive verb forms:

<i>kilmeeec</i>	‘black’
<i>kkilmeeec</i>	‘grey and overcast’
<i>lokcaak</i>	‘be tied’
<i>loklokcaakcaak</i>	‘always tied up’

In Marshallese, unreduplicated statives are reduplicated when used attributively:

<i>p<sup>w</sup>at</i>	‘slow’
<i>wa p<sup>w</sup>atp<sup>w</sup>ōt</i>	‘slow canoe’

A few statives employ initial gemination to form plural forms:

<i>micel</i>	‘thick[sg]’
<i>micelcel</i>	‘thick[pl]’

## 4. Orthography

The practical orthography used by Abo et al (1976) corresponds with the orthography of the wordlist as follows:

Practical orthography	Wordlist	Practical orthography	Wordlist
p	p	i	i
b, bw	p <sup>w</sup>	c	{ c
m	m		{ e
ṃ, mw	m <sup>w</sup>	ā	æ
t	t	ū	ì

Practical orthography	Wordlist	Practical orthography	Wordlist
n	n	ō	{ ə
l	l		{ ʌ
d	r	a	a
ŋ	ɹ	u	u
ɭ	ɭ	o	{ o
r	ɹ		{ ɔ
ŋw	ŋ <sup>w</sup>	ɔ	ɒ
ɭw	ɭ <sup>w</sup>		
rw	ɹ <sup>w</sup>		
j	c		
i/-u, ū	y		
e/-o, ō, ɔ, a	y		
k	k		
ṅ	ŋ		
k <sup>w</sup>	k <sup>w</sup>		
ṅ <sup>w</sup>	ŋ <sup>w</sup>		
w	w

# 71. Ponapean

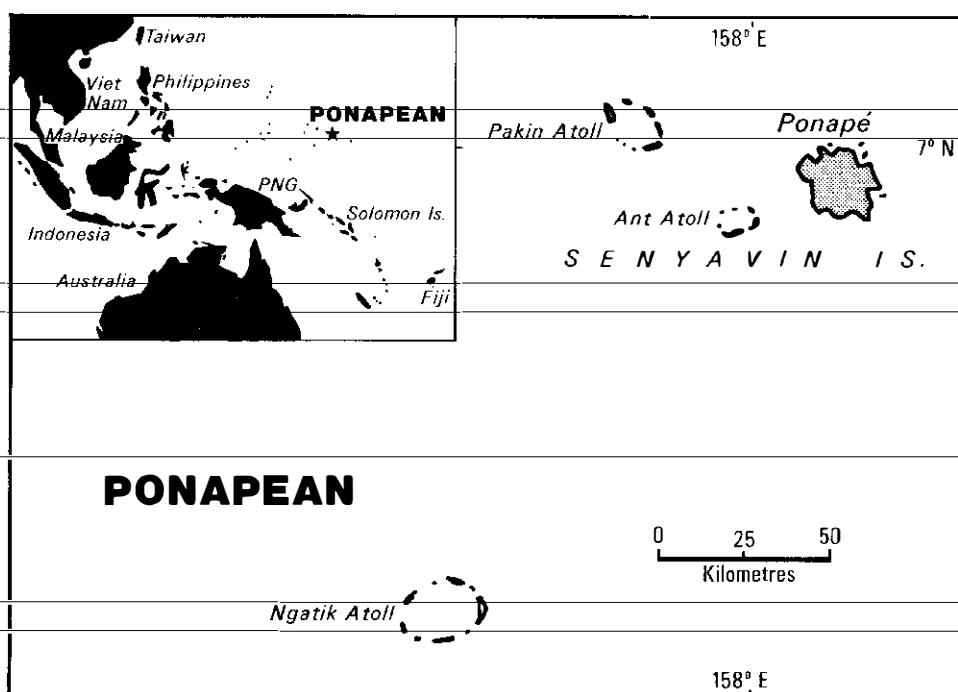

**Contributor:**Introduction and Wordlist: *Sheldon P. Harrison*

## 1. Demography and dialects

Ponapean is spoken as a first language by most of the approximately 20,000 inhabitants of the island of Ponape, the largest (and only high) island of Ponape State, Federated States of Micronesia. Ponapean is universally used as a second language throughout Ponape State, and is known by a substantial number of people in the neighbouring Kosrae State.

Two dialects of Ponapean are recognised on the island of Ponape itself, the Northern dialect and the Southern (or Kiti) dialect. The differences between the two are largely phonological. The Northern dialect has a phonemic contrast between /e/ and /ɛ/, absent in Kiti dialect:

<i>lel</i>	‘wounded’	N. /lel/	K. /lel/
<i>lel</i>	‘to arrive’	N. /leɛ/	K. /lel/

Map 71. Ponapean language area

That contrast is not represented in the standard orthography. Many items in /ε/ in the Northern dialect have /ɔ/ in Kiti:

<i>deng</i>	'taut'	N. /tεŋ/	K. /tɔŋ/
<i>kehɸ</i>	'yam'	N /kēɸ/	K. /kōɸ/

The Northern dialect is widely regarded as the standard, and is the one on which the practical orthography is based. All Ponapean forms given below are Northern dialect.

Ponapean also has a subsidiary system of honorific language, termed "high language", and used in speaking with or about persons of high rank. Some information about the system is given in Rehg (1981). I have included honorific forms where such information was available to me.

Languages closely related to Ponapean are spoken on the nearby atolls of Ngatik, Mokil, and Pingelap. Both Mokilese and Pingelapese are sufficiently different from Ponapean to be considered different languages. Rehg (pers. comm.) regards Ngatikese as a dialect of Ponapean.

## 2. Phonology

### 2.1 Consonants

The following is the phonemic inventory of (the standard northern dialect of) Ponapean consonants:

*Table 1. Consonants*<sup>1</sup>

	Labialised bilabial	Bilabial	Dental	Alveolar	Retroflex	Velar
Stops	<i>p<sup>w</sup></i>	<i>p</i>	<i>t</i>		<i>ʈ</i>	<i>k</i>
Fricatives				<i>s</i>		
Nasals	<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>			<i>ŋ</i>
Trills				<i>r</i>		
Laterals			<i>l</i>			
Semivowels		<i>w</i>		<i>y</i>		

1. Ponapean sonorant consonants may be single or geminate; the orthographic conventions for geminate *m<sup>w</sup>* and *ŋ* are as in Kiribati. Geminate non-sonorants occur only in borrowings and, in some cases, across morpheme boundaries. In other environments, geminate non-sonorants are resolved into homorganic nasal-consonant clusters. See Rehg 1981 for more information.

The phoneme /s/ is referred to by Rehg (1981) as “palatalised”, but in differing degrees from speaker to speaker. The retroflex /ʈ/ is described by Rehg as “affricated” [ʈʂ], but not by all speakers.

Sonorant consonants occur geminate medially, initially, and finally, though initial and final geminates are rare:

<i>kommɔl</i>	‘to rest’	<i>mall</i>	‘clearing’
<i>ŋŋet</i>	‘to pant’		

Geminate non-sonorants occur medially in borrowed words and exclamations. (It is certain that Ponapean had geminate non-sonorants at an earlier period in its history, but such forms have been resolved into non-geminates through a process of nasal dissimilation – see below.)

## 2.2 Vowels

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid-high	<i>e ē</i>		<i>o ō</i>
Mid-low	<i>ɛ ɛ̄</i>		<i>ɔ ɔ̄</i>
Low		<i>a ā</i>	

Vowel length is phonemic in Ponapean.

## 2.3 Phonotactics

Syllables in Ponapean are of the shape (C)V(C), (C)V̄(C) or #N̄, where the latter are initial syllabic nasals in polysyllabic forms:

<i>n̄ta</i>	‘blood’
<i>ŋ̄kɔl</i>	‘make sennit’

The only consonant clusters tolerated, apart from the geminates noted above, are homorganic NC clusters found initially (as in the preceding examples), medially, or finally:

<i>emp</i>	‘coconut crab’
<i>menseŋ</i>	‘morning’

Homorganic NC clusters arise in sandhi over boundaries of various sorts, including reduplication:

<i>pampap</i>	‘swim’	<i>tantar</i>	‘strike (of fish)’
<i>sensel</i>	‘tied’	<i>kaŋkak</i>	‘be able’

Note that expected /nl/ and /nr/ clusters are realised as /ll/ and /rr/, respectively; these geminates can thus be viewed as the realisations of nasal-sonorant clusters. The conditions governing nasal dissimilation over boundaries are complex. Over word internal boundaries other than reduplication, for example, clusters of apical consonants are broken by an epenthetic vowel.<sup>1</sup> Epenthetic vowels are also employed to break non-homorganic consonant clusters, as in:

<i>ʔamaʔaman</i>	‘remember’
<i>ʔiripirap</i>	‘steal’

The status of these vowels is considered in some detail in Rehg (1981: 91ff.).

### 3. Grammatical notes

#### 3.1 Possessive morphology

As in other Micronesian languages,<sup>2</sup> a large class of Ponapean nouns carry possessive suffixes directly. The majority of nouns, however, require a preceding possessive classifier, which carries the suffix. (For details, see Rehg 1981.) Suffix-possessed nouns and possessive classifiers have an eleven-member paradigm, as exemplified by that for *sām* ‘father’:

*Table 3.* Ponapean possessive paradigm

	Singular	Dual	Plural
1 excl			<i>sāmaʔ</i>
1 incl	<i>semei</i>	<i>samaʔa</i>	<i>samaʔail</i>
2nd	<i>semem<sup>w</sup></i>	<i>samam<sup>wa</sup></i>	<i>samam<sup>wail</sup></i>
3rd	<i>seme</i>	<i>samara</i>	<i>samarail</i>
Construct <sup>3</sup>	<i>semen</i>		

1. See Rehg (1981: 58ff) for some discussion.

2. See the discussion of possessive marking in Kiribati.

3. Classifier-possessed (or alienable) nouns have a construct form, used in compounds of various sorts (Rehg 1981: 191-192). It has the form *-in* or *-en* for consonant-final roots, and *-hn* for vowel-final roots.

One might make at least two observations about this paradigm. First, there is some alternation (*a ~ e*) in the stem vowels. Ponapean suffix-possessed nouns can be divided into three major and numerous minor and sub-paradigms on the basis of stem morphophonemics. Second, one observes that the canonical shape of the unsuffixed form *sām* ‘father’ is distinct from the stem *seme-* ~ *sama-* in two respects; it is consonant-final and it has a long vowel. The first of these differences is the result of a general process of (word-final) vowel deletion at some earlier period in the history of Ponapean. Reflexes of historical root-final vowels are preserved only when “protected” from deletion by some suffix, which (as in the case of the third person singular form, for example) was itself subject to deletion. The long vowel in the unsuffixed form is the Ponapean analogue of the Kiribati three mora constraint. In contemporary Ponapean, it is a constraint ensuring that monosyllabic nouns have a long vowel.

Suffix-possessed nouns in dictionary entries are cited in their unsuffixed form, if one exists. Suffix-possessed nouns with no unsuffixed form are cited in the third person singular.

### 3.2 Numerals

Like Kiribati, Ponapean has an elaborate numeral and numeral classifier system. Ponapean numerals are cited in the same form as the corresponding Kiribati numerals.

### 3.3 Transitive verbs and transitive verb morphology

Transitive verbs in Ponapean have at least one corresponding intransitive form. The transitive verb is used if the verb has a (semantically) specific object; the intransitive form(s), otherwise. The morphological relationship between transitive and intransitive forms is not predictable. A large class of verbs have an intransitive apparently formed by removing a final -V(C):

<i>pɔtok</i>	‘to plant s.th.’
<i>pɔi</i>	‘to plant’
<i>laŋa</i>	‘to hang s.th. up’
<i>laŋ</i>	‘to hang’

The consonant, if any, is a thematic consonant, reflecting a Proto-Oceanic final consonant lost at some pre-Proto-Micronesian period unless “protected” by a following vowel. Thematic consonants of Ponapean transitive verbs were exposed when final vowel deletion (see above) removed a vocalic

suffix. Final vowel deletion also accounts for the fact that Ponapean intransitive forms are consonant-final. If, as is frequently the case, the intransitive is reduplicated, a vowel appears between the reduplicated stem and affix:

<i>tūp</i>	‘to bathe s.o.’	<i>itaŋ</i>	‘to press on s.th.’
<i>tutu</i>	‘to bathe’	<i>itait</i>	‘to press’

Rehg (1981: 203f) identifies that vowel, in all cases, with the historical final vowel.

For another large class of verbs, the transitive is formed from the intransitive by means of the suffix *-i*. That device is productive in Ponapean.<sup>1</sup> Other transitive-intransitive pairs are related by ablaut, reduplication, an intransitive suffix *-ek*, or an intransitive prefix, *pV-*. (See Rehg 1981: 202ff for numerous examples.) One might also note that the vowels of transitive and intransitive stems often show morphophonemic alternation in Ponapean:

<i>tətə</i>	‘to spear s.th.’	<i>inaur</i>	‘to lash s.th. with sennit’
<i>tək</i>		<i>inou</i>	

Transitive verbs are cited in their transitive form.

### 3.4 Suffixes in the verbal group

Ponapean verbs can be followed by up to seven suffixes flagging oblique actants or marking directional/aspectual categories.

*Table 4.* Ponapean verbal suffixes

<i>-ki</i> ‘accessory’	PROOBJ <i>-ta</i> ‘up’	<i>-to</i> ‘hither’	<i>-ēŋ</i> ‘to’	PROOBJ <i>-ēr</i> ‘perfect’
	<i>-ti</i> ‘down’	<i>-wei</i> ‘thither’	<i>-saŋ</i> ‘from’	
	<i>-loŋ</i> ‘inwards’	<i>-la</i> ‘away’		
	<i>-iei</i> ‘outwards’			
	<i>-pene</i> ‘together’			
	<i>-peseŋ</i> ‘apart’			
	<i>-seli</i> ‘scattered’			

1. Note, however, that some borrowed verbs form their transitive by means of a short final vowel, harmonic with the preceding root vowel. Compare:

<i>kukī</i>	‘to cook s.th.’;
<i>sap<sup>w</sup>ele</i>	‘to shovel s.th.’

Some of these suffixes induce lengthening in a preceding vowel:

<i>wa</i>	‘to carry’
<i>wākīta</i>	‘to carry s.th. up’

### 3.5 Reduplication

Rehg (1981: 74ff) distinguishes eleven patterns of reduplication in Ponapean:

<i>kaŋkaŋ</i>	< <i>kaŋ</i>	‘eat’
<i>pāpa</i>	< <i>pa</i>	‘weave’
<i>elēl</i>	< <i>el</i>	‘massage’
<i>ayān</i>	< <i>ān</i>	‘accustomed to’
<i>wewa</i>	< <i>wa</i>	‘carry’
<i>popou</i>	< <i>pou</i>	‘cold’
<i>alialu</i>	< <i>alu</i>	‘walk’
<i>lūluwak</i>	< <i>luwak</i>	‘jealous’
<i>mamāsās</i>	< <i>māsās</i>	‘cleared’
<i>ntinta</i>	< <i>nta</i>	‘say’
<i>rerrere</i>	< <i>rere</i>	‘peel’

As already noted for Kiribati, reduplication in Ponapean, as in all Micronesian languages, serves a variety of derivational and inflectional functions. See Harrison (1973) and Rehg (1981: 73ff, 105, 271ff, 206).

### 3.6 Derivational Prefixes

The most common derivational prefixes in Ponapean are:

<i>ka-</i>	causative	<i>weit</i>	‘proceed’	<i>kaweit</i>	‘lead’
<i>sa-</i>	negative	<i>peik</i>	‘obedient’	<i>sapeik</i>	‘disobedient’
<i>li-</i>	given to	<i>pirap</i>	‘steal’	<i>lipirap</i>	‘thieving’
<i>ak-</i>	showing	<i>lemei</i>	‘cruel’	<i>aklemei</i>	‘tough’

## 4. Orthography

The practical orthography of Ponapean differs from the phonemic system used here in the following respects:

Practical orthography	CAD phonemic
<i>d</i>	<i>t</i>
<i>t</i>	<i>t̚</i>
<i>pw</i>	<i>p<sup>w</sup></i>
<i>mw</i>	<i>m<sup>w</sup></i>
<i>ng</i>	<i>ŋ</i>
<i>oa</i>	<i>ɔ</i>

Following an orthographic convention set by German missionaries, long vowels are written with a following *h* :

<i>ihs</i>	/iːs/	‘who’
<i>dohl</i>	/d̥oːl/	‘mountain’
<i>soahn</i>	/s̥oːn/	‘wounded’

As one might expect, single syllable-initial high vowels are realised as glides. Only the high back glide is distinguished in the standard orthography, however:

<i>wadek</i>	/watek/	‘to read’
<i>sawa</i>	/sawa/	‘taro’
but: <i>iaa</i>	/iā/	‘where?’
<i>aio</i>	/ayo/	‘yesterday’

Syllabic coda glides are not distinguished orthographically from the corresponding high vowels.

## 72. Woleaian

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Sheldon P. Harrison</i>
---

---

---

### 1. Demography

---

Woleai Atoll is situated in the western Caroline Islands, Yap State, Federated States of Micronesia. Though Woleai itself has a population of under 750, nearby islands (for example, Eurapik, Lamotrek, and Ifaluk), whose languages are very close to Woleaian, increase the Woleaian-speaking population to upwards of 2,000. (It is likely that a reasonable degree of mutual intelligibility characterises most of the western Trukic languages.)

---

---

### 2. Phonology

#### 2.1 Consonants

---

The following chart gives the phonemic inventory of Woleaian, classified in terms of point and manner of articulation:

---

---

*Table 1.* Consonants

	Labialised labial	Labial	Alvcolar	Retroflex	Palatal	Velar
Stops	<i>p<sup>w</sup></i>	<i>p</i>	<i>t</i>		<i>c</i>	<i>k</i>
Fricatives	<i>ϕ<sup>w</sup></i>	<i>f</i>	<i>s</i>	<i>ʂ</i>		<i>x</i>
Nasals	<i>m<sup>w</sup></i>	<i>m</i>	<i>n</i>			<i>ŋ</i>
Vibrants			<i>ɾ</i>	<i>ɽ</i>		
Semivowels	<i>w</i>				<i>y</i>	

---

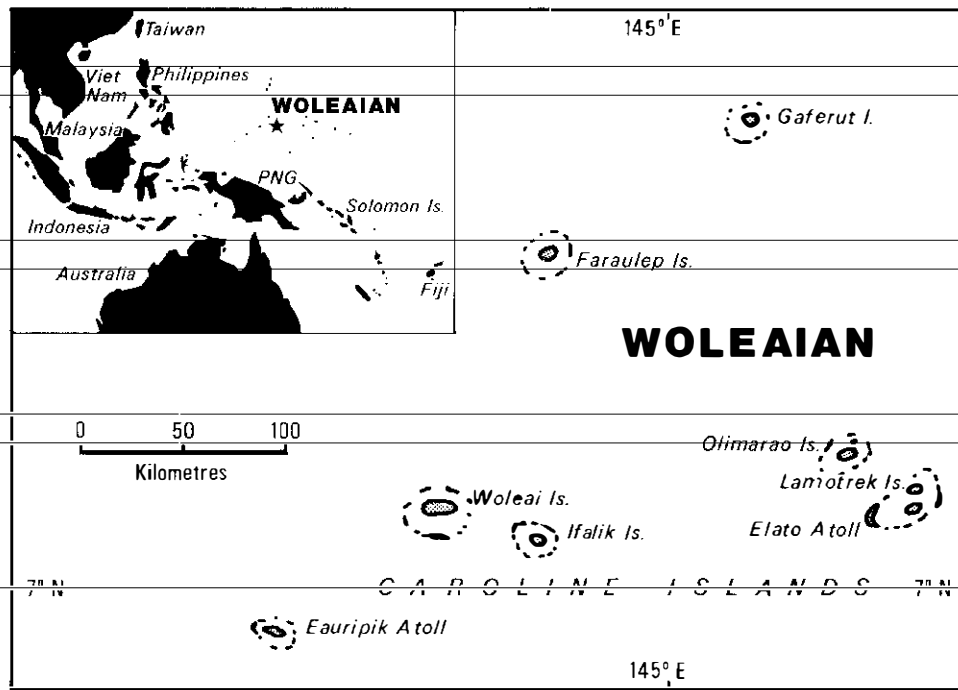

---

There is a distinction between non-geminate and geminate consonants, and on Sohn's (1975) analysis, /k/ and /n/ are the geminate counterparts of /x/ and /ŋ/ respectively, whilst /c/ is the geminate counterpart of both /ʂ/ and /ɽ/.

---

---

Map 72. Woleaian language area

## 2.2 Vowels

Table 2. Vowels (short)

	Front	Central	Back
High	<i>i</i>	<i>ü</i>	<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Table 3. Vowels (long)

	Front	Central	Back
High	<i>ī</i>	<i>ǖ</i>	<i>ū</i>
Mid	<i>ē</i>	<i>ō̄</i>	<i>ō</i>
Low		<i>ā</i>	<i>ā̄</i>

Non-low central vowels are rounded. Note that the long vowels /ī/ and /ō/ have no short counterparts, and also that long and short high central vowels are not distinguished neither orthographically nor in the wordlist.

Non-low short vowels are voiceless in final position. One of the vagaries of the standard Woleaian orthography is that such vowels are not written, except in the case of monosyllables:

<i>kel</i>	/keři/	[keɻi]	‘dig’
<i>mas</i>	/mase/	[masɛ]	‘die’
<i>matt</i>	/matto/	[matto]	‘sit’
<i>kki</i>	/kkī/	[kkī]	‘spicy’
<i>tto</i>	/ttō/ <sup>1</sup>	[tto]	‘deep’

The absence of a voiceless /a/ is the result of a regular process of final low vowel raising. The same process spreads, right to left, to alternate low vowels (beginning with an antepenultimate /a/ if the final vowel is not low):

/metaře/	[metale]	‘his eye’
/matemami/	[matemami]	‘our eyes’

Note that low vowels are also raised between high syllables:

/itei/	‘my name’
/itaře/	‘his name’

### 2.3 Canonical shape

When one allows for final voiceless vowels, all Woleaian syllables are of the form (C)V(G) or V(G), where C may be geminate, and V long. (G represents a coda glide, orthographically represented as a vowel.)

Woleaian nouns are subject to a counterpart of the Kiribati three mora constraint. As in Kiribati, geminate consonants contribute a mora, as do (systematically long) voiced final vowels. The effects of the three mora constraint are not, however, represented orthographically in Woleaian:

<i>it</i>	/ite/	[iite]	‘name’
<i>lang</i>	/laŋo/	[lāŋo]	‘house fly’
<i>cha</i>	/ccā/	[cca]	‘blood’
<i>peshe</i>	/pešē/	[peše]	‘leg’

1. Orthographic short final vowels are typically voiced, as in *bbo* (/p<sup>w</sup>ō/) ‘pounding stone’ or *wa* (/wā/) ‘canoe’. (Woleaian orthography is thus inconsistent in the interpretation of such vowels.) Such vowels are in fact systematically long, and are pronounced as such in sandhi.

### 3. Morphology

#### 3.1 Nouns

The possessive marking and numeral systems of Woleaian are similar to those described earlier for Ponapean. Woleaian suffix-possessed forms have the following paradigm, exemplified by *temāre* ‘his father’:

	Singular	Plural
1 incl		<i>temaṣe</i>
1 excl	<i>temai</i>	<i>tamemami</i>
2nd	<i>temam<sup>w</sup>u</i>	<i>temamī</i>
3rd	<i>temāre</i>	<i>temāre</i>
Construct	<i>temaŋi</i>	

#### 3.2 Transitive verbs

Woleaian transitive verbs have a paradigm reminiscent of that of Kiribati, exemplified here by *weri*<sup>1</sup> ‘see him/her/it’:

	Singular	Plural
1incl		<i>weṛixiṣa</i>
1excl	<i>weṛiyei</i>	<i>weṛixemami</i>
2nd	<i>weṛixo</i>	<i>weṛixemī</i>
3rd	<i>weṛī</i>	<i>weṛīre</i>

Transitive-intransitive verb relationships in Woleaian are parallel to those found in other Micronesian languages. Woleaian has the typically Micronesian thematic and vowel-stem transitive verbs, as discussed earlier for Ponapean. As in other Micronesian languages, many intransitive forms of transitive verbs are reduplicated.

Some forty Woleaian transitive verbs have a stative intransitive counterpart in *-exi* or *-axi* (cognate with the Kiribati passive *-aki*). The

1. The final *-i-* preceding suffixes in this paradigm can be regarded as a transitive stem formant (cognate with the *-i-* of the Gilbertese thematic paradigm exemplified earlier). A second, vowel-stem paradigm in Woleaian has no *-i-* before object suffixes. A large number of Woleaian transitive verbs of both these classes take a glide (*-y* or *-w*), harmonic with the immediately preceding vowel, in the third person singular.

Kiribati transitiviser *-na* also has a cognate in Woleaian *-ñ*. Woleaian *-ñ* is a denominal transitiviser.

### 3.3 Reduplication

$C_1V_1C_1$ -reduplication is employed inflectionally in Woleaian (and in other Trukic languages) as an inchoative or progressive marker. Other reduplication patterns (final  $-CVC \geq V$  and initial  $CV-$ ) are used in the derivation of intransitive verbs, denominal verbs, and so forth. The consonant in initial  $CV-$  reduplications in Woleaian is geminated in both the stem and the reduplicated prefix:

<i>cecalü</i>	‘to water’	< <i>şañü</i>	‘fresh water’
<i>cecañe</i>	‘to powder’	< <i>řaña</i>	‘turmeric powder’

Gemination alone serves as  $CV-$  reduplication for many forms:

<i>p<sup>w</sup>ux</i>	‘boiled’	cf. $\phi^w$ <i>uxa</i>	‘boil it’
<i>kewāg</i>	‘exiled’	< <i>xaw</i>	‘run away’

Consonants are also frequently geminated following the causative prefix *-xa*, as in:

<i>xemmasür</i>	‘put to sleep’	< <i>masür</i>	‘sleep’
<i>xacewar</i>	‘carry’	< <i>şewar</i>	‘move’

## 4. Orthography

The practical orthography of Woleaian differs from the phonemic system used here in the following respects:

Practical orthography	CAD phonemic
<i>b</i>	$\phi^w$
<i>bb</i>	$p^w$
<i>mw</i>	$m^w$
<i>l</i>	<i>ř</i>
<i>sh</i>	<i>ş</i>
<i>r</i>	<i>ř</i>
<i>ch</i>	<i>c</i>
<i>g</i>	<i>x</i>
<i>ng</i>	<i>ŋ</i>

---

---

## 73. Eastern Fijian (Bauan)

---

---

<b>Contributor:</b>
---------------------

Wordlist and Introduction: <i>Paul Geraghty</i>
---

---

---

### 1. Introduction

---

The Bauan dialect of the Eastern Fijian language is spoken on Bau, a very small island situated off the south-east coast of Vitilevu, the main island of Fiji, and almost entirely occupied by three villages (Bau, Soso, Lasakau) with a total resident population of less than 1,000.

The varieties of Fijian spoken on the islands of Viwa, north of Bau, and Batiki and Nairai, east of Bau in the Lomaiviti group, are said to be identical to Bauan, though there are probably minor lexical differences. Bauan is also closely related to the languages of the adjacent mainland (Kaba, Kiuva, Burētū, Cautatā, Taiobau) though they differ somewhat in lexicon (e.g. *rewai* ‘eel’ for Bau *duna*), and in changing unstressed *ei* to *ī*, e.g. *kīmami* ‘first person exclusive plural pronoun’ (Bauan *keimamī*), *vī-* ‘reciprocal prefix’ (Bau *veī*), and unstressed *ou* to *ū*, e.g. *dū* ‘second person paucal pronoun’, Bau *dou*.

The languages of the Rewa delta area to the southwest and Verata to the north (which includes Moturiki and parts of Ovalau and Koro) are also quite similar. All of these belong to the Vitieloma subgroup of the Eastern Fijian languages (Geraghty 1983: 313-314).

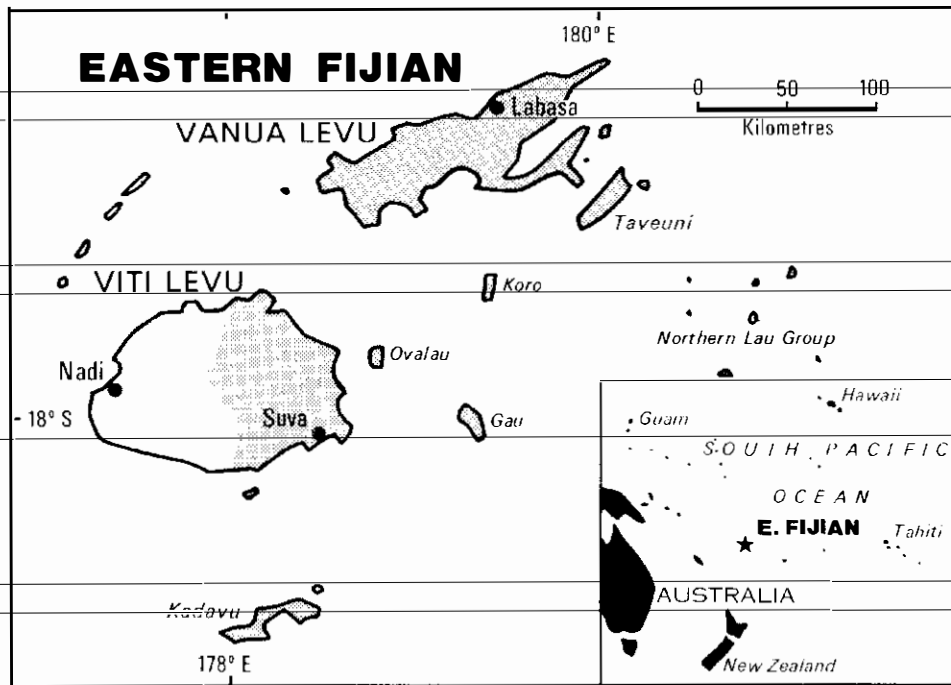

Bau was the seat of the most powerful chiefdom of eastern Fiji in the early nineteenth century, so its language was selected by the missionaries as the national literary language.

However, since missionary effort had begun in Lau, the eastern islands closest to Tonga, the missionaries had all learned Lauan as their first Fijian language, so the standard language that emerged in their speech and in the translation of the Bible was a mixture of Lauan and Bauan, modified by English syntax and semantics (Geraghty 1984: 35-36, 1989: 384-387). This variety has been referred to in recent linguistic literature as “Old High Fijian”, though it is popularly known as “Bauan”, as are all non-regional varieties of Fijian, including the Colloquial Fijian of the towns. The numerous studies of “Fijian” or “Bauan Fijian”, e.g. Capell (1941), Churchward (1941), Milner (1956), have all been concerned with Old High Fijian. The most recent

---

---

grammar, Schütz (1985), does take some account of Colloquial Fijian. This wordlist, however, is of the language of Bau, and is based primarily on fieldwork on Bau and on interviews with Bauan speakers in Suva.

Map 73. Eastern Fijian language area

Fiji being a former British colony, English is the source of most loanwords. Those adopted in the early nineteenth century were by way of Tonga, since Tonga was visited before Fiji by the early explorers. A number of loanwords from Tongan (e.g. *totogi* 'fine, punishment') date from the mid-nineteenth century when Tongans established control over much of Fiji and formed the country's first western-style government. Some terms from Latin and French were introduced by Catholic missionaries, and there are a few loans from the Hindi of the indentured labourers from India whose descendants now constitute about half of the population of Fiji.

## 2. Phonology

Stress falls on the penultimate vowel of each stress group, long vowels reckoned as double, diphthongs as single. There are five vowels, each with phonemic length. /a/ tends to centralise when unstressed and in the diphthong /ai/. The vowel sequences /ae/ and /ao/ are not found. /t/ and /d/ tend to be

palatalised before /i/, especially in the speech of the young, presumably under the influence of Colloquial Fijian.

The following are the consonants of Bauan:

Table 1. Consonants<sup>1</sup>

		Bilabial	Dental	Alveolar	Post-alveolar	Velar
Stops/Affricates	vl	(p)	t		(č)	k
	vd prenas	b	d	d <sup>r</sup>	(j)	g
Fricatives	vl	(f)	s			
	vd	β	ð			
Nasals		m	n			ŋ
Laterals				l		
Vibrants				r		
Semivowels		w			y	

Those in parentheses are introduced phonemes. They are entirely absent in the speech of some older Bauans, who use /β/ for /p/ and /f/, /ti/ for /č/, and /di/ for /j/. Most Bauans use /p/ and /č/, and younger speakers include also /f/ and /j/.

Bauan has no closed syllables, though they are becoming common in contemporary loanwords, e.g. *konteina* ‘(plastic) container’, *ček-taka* ‘check’. Long vowels are obligatorily shortened, and certain vowel sequences become diphthongs, before a final unstressed vowel, so: *βū* ‘cause’ + *na* ‘its’ > *βuna* ‘its cause’, *tā* ‘chop’ + *ya* transitive > *taya* ‘chop it’, *rai* ‘see’ + *ða* transitive > *raiða* ‘see it’ (*ai* becomes a diphthong).

Note: In the practical orthography used throughout the Fiji Islands, *b* = [ᵐb], *d* = [ᵐd], *q* = [ᵐg], *g* = [ŋ], *c* = [ð], *v* = [β], *dr* = [ᵐdʳ], *j* = [č], *z* = [ɲ].

Table 2. Vowels

	Front	Central	Back
High	i ī		u ū
Mid	e ē		o ō
Low		a ā	

1. In standard Fijian orthography *v* = β, *c* = ð, *dr* = d<sup>r</sup>, *j* = č, *z* = ɲ, *q* = g, *qw* = g<sup>w</sup>, *g* = ŋ, *gw* = ŋ<sup>w</sup>.

### 3. Morphology

There are two major classes of nouns with regard to pronominal possession, those that take one of a set of 15 suffixes, and those that do not. Suffix-possessed nouns, which are most commonly part-of-whole nouns including body-parts (*ulu-gu* ‘my head’, *ulu-mu* ‘your head’, etc.), are indicated in the list by a suffixed hyphen, e.g. *ulu-* ‘head’.

Transitivity is indicated by one of a small set of suffixed consonants (including  $\emptyset$ ), or a suffix of the form *-Cak*, followed by *-i* or *-a*. These transitive consonants are to a large extent semantically determined, e.g. “physical” verbs mostly take *-ḍ* (*d<sup>r</sup>ami-ḍa* ‘lick’, *uβu-ḍa* ‘blow’, *boi-ḍa* ‘smell’, *reḡu-ḍa* ‘kiss’, *rai-ḍa* ‘see’), barring phonotactic constraints. In the list, the *a* transitive form is given. When the base ends in *a* and the consonant of the transitive suffix is zero, the following transitive *a* combines with the *a* of the base to form a long vowel, e.g. *visa* ‘set fire’, *visa-a* = *visā* ‘set fire to it’.

All verbs are preceded by a pronoun marking the person and number of the subject, and all non-common objects immediately follow the verb. Otherwise, the order of sentence constituents is quite fluid. The false claim commonly found in linguistic literature that Bauan is a strict VOS language appears to derive ultimately from an arbitrary decision made by the translator of the Fijian bible (Geraghty, 1989: 390).

The most common verbal prefix is *βaka-* (with its allomorph *βā-* before velar consonants), which forms causative verbs, intensive verbs, adjectives, etc.:

<i>kama</i>	‘burn, aflame’	<i>βā-kama-a</i>	‘burn’ (vb trans)
<i>lutu</i>	‘fall’	<i>βaka-lutu-ma</i>	‘drop’
<i>rai-ḍa</i>	‘see, look at’	<i>βaka-rai-ḍa</i>	‘stare at, look for’
<i>dua</i>	‘one’	<i>βaka-dua</i>	‘once’

The prefix *vei-* denotes reciprocal or collective action:

<i>βala</i>	‘fight’	<i>βeiβala</i>	‘fight each other, quarrel’
<i>βā</i>	‘talk back’	<i>βeiβā</i>	‘argue’

Nouns are compounded by attribution or with the ‘genitive particle’ *ni*:

<i>ḡone-yalewa</i>	child-female	=	‘girl’
<i>βale-laḍa</i>	house-canvas	=	‘tent’
<i>tama-ni-mē</i>	father-of-goat	=	‘billy-goat’
<i>mata-ni-suḍu-</i>	point-of-breast	=	‘nipple’

<i>βale-ni-kuro</i>	house-of-pots	=	'kitchen'
<i>wai-ni-mata-</i>	water-of-eye	=	'tears'

The prefix *i-* before a simple base forms instrumental nouns:

<i>sele-ta</i>	'cut'	<i>i-sele</i>	'knife'
<i>gagi-a</i>	'crush'	<i>i-gagi</i>	'mill'
<i>ōula-a</i>	'pierce'	<i>i-ōula</i>	'needle'

Before a reduplicated base, the meaning is more often locative:

<i>bulu-ta</i>	'bury'	<i>i-bulubulu</i>	'grave'
<i>kawa-ōa</i>	'cross over'	<i>i-kawakawa</i>	'bridge'
<i>kele</i>	'be anchored'	<i>i-kelekele</i>	'anchorage, harbour'

## 74. Western Fijian (Nadrogā)

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist: <i>Paul Geraghty</i>
---

---

---

### 1. Introduction

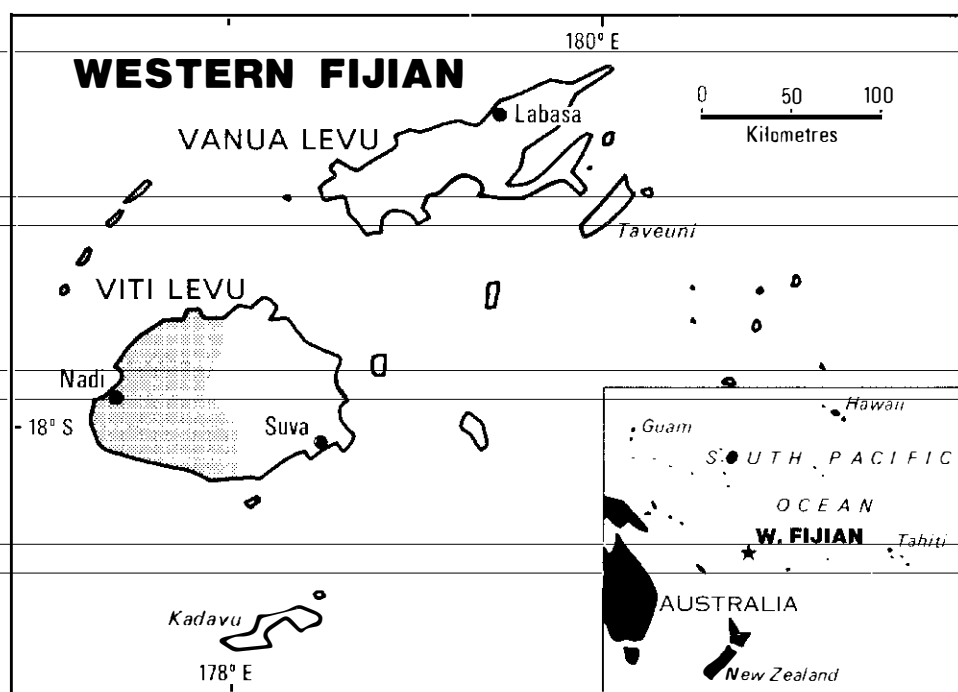

---

The Nadrogā dialect of the Western Fijian language is spoken in about 20 villages, with a total resident population of approximately 5,000, in the districts of Cuvu, Sigatoka, and Nokonoko, in Nadrogā-Navōsā province, which together constitute the traditional and contemporary nucleus of the *vanua* (state) of Nadrogā, south-west Vitilevu, united under a paramount chief whose title is *na kwālevu*. A dozen or so surrounding districts have quite similar communalects, and are included in a “greater Nadrogā” language area (see map). Nadrogā Fijian is not mutually intelligible with Standard Fijian, though probably all speakers of Nadrogā also have at least a passive knowledge of Standard Fijian, which is used extensively in education and the church, exclusively on the radio and in literature. Nadrogā is closely related to the languages of Vatulele island to the south, Vusu and Sērua to the east, and Nasikawa to the north-east, less closely to the various communalects of Ba province to the north. All these belong to the Western subgroup of Fijian (Geraghty 1983: 278-287, 290-291).

Very little has been published on Nadrogā. The earliest account of Nadrogā contains a list of some 220 place-names provided by the then chief (Dumont d’Urville 1834, vol. 4: 715-717), but in a phonology largely modified towards Standard Fijian, with e.g. only one instance of *\*t* being realised as /č/ before /u/ (*Abounanitchou* ‘Wavunaniju’). Schütz (1985: 65) refers to a list of six words with a brief mention of the pronouns and transitive endings in a manuscript compiled in the 1840s by the missionary John Hunt; but by the time the missionaries moved into Nadrogā, the decision had already been made, and widely accepted, that the Eastern Fijian language Bauan would be the standard Fijian language, so little attention was paid to Nadrogā. The first published text in a variety of Nadrogā was a short fable collected and transcribed by Rev. Lorimer Fison and published in Gatschet (1885: 207-208). Arthur Capell was probably the first linguist to carry out fieldwork in Nadrogā, in 1940, and compiled a short grammar (Capell 1941a) which was never published. The only material published was

---

a list of pronouns and deictics (fold-out supplement to Capell (1941b) absent from recent editions) and a handful of words in Capell – Lester (1941: 36-38). Biggs (1953) is a far more substantial list of words and phrases, but from Lomawai, a communalect situated towards the north-western periphery of the Greater Nadrogā language area, so rather different from the Nadrogā of this list. Schütz's (1962) unpublished dialect survey covers a number of villages in the Nadrogā area, and Schütz (1963) includes a study of Nadrogā phonology resulting from that survey. Most recently the present author has published fairly extensive data from Nadrogā in Geraghty (1977), Geraghty (1983), and Qereti (1990) (all *passim*). Information for this list was gathered on numerous weekend fieldtrips, particularly to Yadua village.

Map 74. Western Fijian language area

The major source for loanwords used to be English, either directly or via Tongan; now it is English via Standard Fijian, with a small number from Fiji Hindi, the language of the descendants of indentured labourers whose main occupation is still sugarcane farming. Many speakers of Nadrogā, particularly males, also speak Fiji Hindi, more so than is usual in other parts of Fiji. Similarly, many Indians, particularly males, also speak Nadrogā.

## 2. Phonology

Stress is usually penultimate, long vowels reckoned as two syllables. Pretonic /a/ is obligatorily lengthened, e.g. *na vā'nua* 'the land', *na vanu'ā* 'levu' 'the big land', and long vowels tend to shorten finally. There is also vowel assimilation across word boundaries, word-final /a/ assimilating to a following vowel, e.g. *na ḏa* 'what', *na ḏe i k<sup>w</sup>aya* 'what are you saying', *na ḏo o k<sup>w</sup>aya* 'what did you say'.

There are no consonant clusters and all syllables are open, except that unstressed /u/ is often deleted after /m/, e.g. /mu-/ + /-ma/ > *mma* 'your tongue', *yamu* or *yam* 'mosquito'. There are no diphthongs.

Historically, *t* became *s* before *i* and *e*, and [č] before *u*, while \**d* > [ñj] before *i*, *u*. Because of irregular developments in the pronouns and loans, /t/ /d/ /č/ and /j/ are now all separate phonemes. Almost emblematic of Nadrogā speech is the change of \**s* to *h*, in which it is unique in Fiji.

Table 1. Consonants

		Bilabial	Dental	Al- veolar	Post- alveolar	Velar	Lab. velar	Glottal
Stops	vl		<i>t</i>		<i>č</i>	<i>k</i>	<i>k<sup>w</sup></i>	(?)
	vd prenas	<i>b</i>	<i>d</i>	<i>d<sup>r</sup></i>	<i>č<sup>j</sup></i>	<i>g</i>	<i>g<sup>w</sup></i>	
Fricatives	vl			<i>s</i>				<i>h</i>
	vd	<i>β</i>	<i>ḏ</i>					
Nasals		<i>m</i>	<i>n</i>			<i>ŋ</i>	<i>ŋ<sup>w</sup></i>	
Laterals				<i>l</i>				
Vibrants				<i>r</i>				
Semivowels		<i>w</i>			<i>y</i>			

Glottal stop occurs in only one word: *o<sup>2</sup>ō* 'this'. In addition to the practical spelling conventions listed on p. 921, in Western Fijian *qw* = [ŋ<sup>g</sup>w] and *gw* = [ŋ<sup>w</sup>].

Nadrogā has the usual five vowel system, each with phonemic length.

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a ā</i>	

### 3. Morphology

There are two lexically defined possession classes of nouns: suffix-possessed and others. All suffix-possessed nouns are kin-terms, e.g. *tama-* ‘father’, *huna-* ‘mother’, *karua-* ‘grandchild’: *tamam* ‘your father’, *hunaya* ‘his mother’, *karuaya o Naomi* ‘Naomi’s grandchild’.

Possession of all other nouns is semantically determined. If conceived as part of a whole, it is prefix-possessed: *e-karua* ‘the second one’, *gu-yabaki* ‘my age’, *m-mata* ‘your eye’, *e-čula na kai* ‘the branch of the tree’. Otherwise, the categories are similar to those of Standard Fijian, possessive pronouns being suffixed to one of three bases: *na ke-gu doko* ‘my taro (I eat it)’, *na me-m tovu* ‘your sugarcane (you ‘drink’ it)’, *na le-d<sup>r</sup>u were* ‘their house’, *na le-ču tata* ‘our (inclusive plural) language’.

Compound nouns are formed by juxtaposition or with the genitive particle *ni*, or occasionally its allomorphs *si* or *ri*:

<i>were-laya</i>	house-canvas	=	‘tent’
<i>huna-hewa</i>	female-small	=	‘girl’
<i>k<sup>w</sup>a-leikana</i>	thing-eaten	=	‘food’
<i>mata-ni-were</i>	opening-of-house	=	‘door’
<i>g<sup>w</sup>ara-ni-ŋiđu</i>	hole-of-nose	=	‘nostril’
<i>kakaβulu-si-mata</i>	hair-of-eye	=	‘eyelash’
<i>taba-ri-ŋuhu</i>	skin-of-mouth	=	‘lips’

Agentive nouns are formed with the prefix *d<sup>r</sup>ou-*:

<i>d<sup>r</sup>awe</i>	‘to farm’	<i>d<sup>r</sup>ou-d<sup>r</sup>awe</i>	‘farmer’
<i>lawata</i>	‘compose poetry’	<i>d<sup>r</sup>ou-lawata</i>	‘poet’
<i>tađi</i>	‘to fish’	<i>d<sup>r</sup>ou-tađi</i>	‘fisherman’

The prefix *i-* forms instrumental and other nouns from verbs:

<i>βaβi</i>	‘bake’	<i>i-βaβi</i>	‘oven’
<i>kaβa</i>	‘to comb’	<i>i-kaβa</i>	‘comb’
<i>đake</i>	‘climb’	<i>i-đakeđake</i>	‘ladder’
<i>tad<sup>r</sup>a</i>	‘sit’	<i>i-tad<sup>r</sup>atad<sup>r</sup>a</i>	‘seat, chair’

The most common verbal prefix is *βa-* (*βe-* before *i*) which forms causatives, intensives etc.:

<i>mase</i>	‘dead’	<i>βa-mase</i>	‘kill’
<i>lō</i>	‘extinguished’	<i>βa-lō</i>	‘extinguish’
<i>βele</i>	‘lost’	<i>βa-βele-nia</i>	‘lose’

<i>seku-đia</i>	‘follow’	<i>βa-seku-đia</i>	‘imitate’
<i>i-hulu</i>	‘clothes’	<i>βe-i-hulu</i>	‘get dressed’
<i>rua</i>	‘two’	<i>βa-rua</i>	‘twice’

The prefix *βī-* denotes reciprocity or collective action:

<i>ođa</i>	‘angry’	<i>βī-ođa-si</i>	‘strife’
<i>dei</i>	‘leave’	<i>βī-dei</i>	‘divorce’

Transitive suffixes are more varied than those of Standard Fijian. Most verbs form their transitive with a suffix of the form *-Ki-a* and/or *Kaki(ni-a)*, where *K* is one of a set of consonants, including zero, determined at least partially by the semantics of the verb, and the final *-a* is a third person singular object marker, one of a set of eleven person-and-number-marked object markers:

<i>toβo-lia</i>	‘taste’	<i>dere-ia</i>	‘touch’
<i>hogo-mia</i>	‘catch’	<i>βodʹo-gia</i>	‘swallow’
<i>loβo-nia</i>	‘bury’	<i>čube-ria</i>	‘carry’
<i>yabo-sia</i>	‘kiss’	<i>βarau-taki-nia</i>	‘prepare, weigh’
<i>βuli-đia</i>	‘turn-over’	<i>umi-đaki-nia</i>	‘regret’
<i>nahu-kia</i>	‘bind’	<i>holo-maki-nia</i>	‘hide’

A smaller number of verbs form the transitive with no transitive suffix, simply adding the object suffix *-a*, which assimilates to the final vowel of the base:

<i>tara+a = tarā</i>	‘do, make’
<i>lese+a = lesē</i>	‘roast’
<i>lido+a = lidō</i>	‘pour’
<i>roŋo+a = roŋō</i>	‘hear’

Others change the final vowel of the base to *i*:

<i>βana - βania</i>	‘shoot’
<i>kana - kania</i>	‘eat’
<i>homu - homia</i>	‘drink’

A small class comprises monosyllabic bases, which reduplicate to form the intransitive:

<i>mama - maŋia</i>	‘chew’
<i>βiβi - βiđia</i>	‘wind’
<i>dodo - dokia</i>	‘stretch’
<i>toto - tokia</i>	‘pull’
<i>gigi - giđia</i>	‘roll’

# 75. Rotuman

**Contributors:**

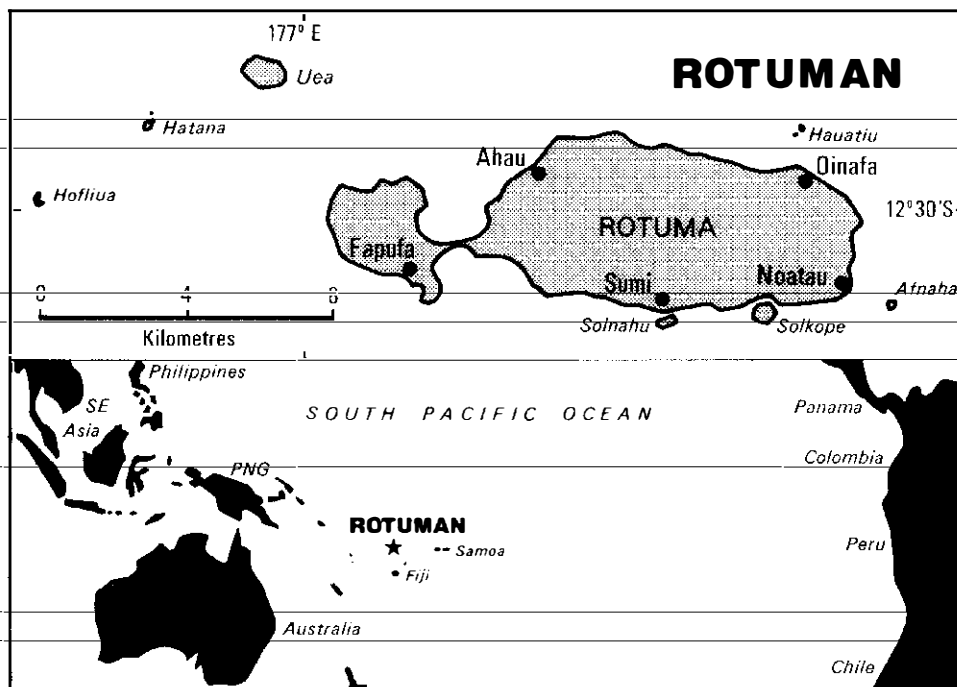

Introduction: *Paul Geraghty*

Wordlist: *Hans Schmidt – Paul Geraghty*

## 1. Introduction

Rotuman is the language of the approximately 2,600 inhabitants of the small island of Rotuma, situated some 250 miles NNW of Vanualevu, Fiji, and politically part of Fiji. Its nearest neighbour is Futuna, about 240 miles to the East. In addition, Rotuman is the main language of most of the 5,000 or so Rotumans living in Fiji. There is only very slight dialect variation.

This list was originally compiled by Hans Schmidt of the University of Hamburg, based on Churchward's standard work and his own 1981 field-notes. It was subsequently revised by Lavenia Kaurasi, an educational administrator resident in Suva, and finalised by the author and Hapoti Hae with the help of a number of elderly Rotumans from the Suva area.

Map 75. Rotuman language area

The earliest systematic description of Rotuman was by Horatio Hale (1846). Turner (1884) included a short wordlist. At least one sound change can be traced from these early records: \**t* is recorded consistently as [θ] by Hale, while Turner lists mostly [θ] but [f] in some 25 per cent of the cases. By Churchward's time (1930s), the change to [f] was complete.

Historically, Rotuman is the sole member of the Rotuman subgroup of Central Pacific (Pawley 1979, Geraghty 1986), the other two subgroups being Fijian and Polynesian. It has long excited interest among linguists, both for its atypical vowel system and syllable structure (the result of assimilation and metathesis; see Besnier 1987 and below) and its history of extensive borrowing from Polynesian languages (Biggs 1965). These Polynesian loans constitute a considerable portion of the lexicon, and are thoroughly assimilated (rather like the French and Latin input into Middle English); moreover, it is often difficult to pinpoint the exact Polynesian source, so these loans are not indicated as such in this list. Only recent loans, mostly from English and Fijian, are noted.

## 2. Phonology

### 2.1 Consonants

The phonemic inventory is as follows:

*Table 1. Consonants*

	Bilabial	Labio-dental	Dental	Alveo-palatal	Velar	Glottal
Stops	<i>p</i>		<i>t</i>	<i>ʃ</i>	<i>k</i>	<i>ʔ</i>
Fricatives	<i>v</i> <i>ɸ</i>	<i>f</i> <i>v</i>	<i>s</i>			<i>h</i>
Nasals	<i>m</i>		<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			
Flaps			<i>r</i>			
Semivowels	<i>w</i>			<i>y</i>		

## 2.2 Vowels

Table 2. Vowels (underlying)

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>ɔ</i>
Low		<i>a</i>	

Table 3. Vowels (surface)

	Front	Central	Back
High	<i>i ü</i>		<i>u</i>
Mid-high	<i>e ø</i>		<i>o</i>
Mid-low	<i>æ</i>		<i>ɔ</i>
Low		<i>a</i>	

The currently accepted writing system embodies the following conventions:

[č]	is written as	<i>j</i>
[ŋ]	is written as	<i>g</i>
[ø]	is written as	<i>ö</i>
[ɔ]	is written as	<i>ɔ̄</i>
[æ]	is written as	<i>ä</i>

For more details of pronunciation, see Churchward (1940) and Besnier (1987).

## 3. Morphophonemics

In many environments (see Churchward 1940 for the rules), Rotuman employs a declined form (“incomplete phase”) instead of the citation form (“complete phase”). In the wordlist it can be observed that in compounds all except the last morpheme are in declined form (e.g. *kef-kefu* < \**kefu-kefu*, *leʔ-pure* < \**leʔe-pure*). The declined form is derived from the citation form as follows:

1. metathesis of final vowel and preceding consonant (*tapiko* > *tapiok*)
2. geminate reduction where  $V_1 = V_2$  (*ala* > *aal* > *al*)

## 3. vowel elision:

$V_2$  is dropped except when  $V_1$  is higher ( $-iCu > -iuC > -iC$ )

## 4. semivowel development:

if  $V_1$  is higher than  $V_2$ , it changes into the related semivowel  
( $-iCe > -ieC > -yeC$ )

## 5. umlaut:

a non-front vowel followed by a front vowel which is as high or higher develops into an umlaut:

$-aCi > aiC > -æC$

$-oCe > oeC > -øC$

$-oCi > oiC$

$-uCi > uiC > -üC$

## 6. syllable reduction

## 7. accent shift from penultimate to ultimate

Table 4. Morphophonemic summary:

Citation form ("complete phase")						Declined form ("incomplete phase")							
$V_2$ :	i	u	e	o	a	$V_2$ :	i	u	e	o	a		
$V_1$	i	iCi	iCu	iCe	iCo	iCa	$V_1$	i	iC	iC	yeC	yoC	yɔC
	u	uCi	uCu	uCe	uCo	uCa		u	üC	uC	weC	woC	wɔC
	e	eCi	eCu	eCe	eCo	eCa		e	eC	eC	eC	eC	yaC
	o	oCi	oCu	oCe	oCo	oCa		o	øC	oC	øC	oC	waC
	a	ɔCi	ɔCu	æCe	aCo	aCa		a	æC	ɔC	æC	aC	aC

As can be deduced from the bottom line of the citation form table, certain assimilatory changes have already occurred in citation forms, viz:

$a > æ / \_ (C)e$

and  $a > ɔ / \_ (C) i, u$

likewise in declined forms:  $a > ɔ / i, u\_C$

#### 4. Morphology

Reduplication, both full and partial, is a common process in Rotuman yielding frequentative verbs and plural adjectives, though the fact that many forms are fossilised (e.g. *fanfana* ‘sand’, *hufhufu* ‘bat’, *ne?ne?i* ‘strong’) suggests that it was even more productive formerly. Examples of lexicalised reduplication in the list include:

<i>pera</i>	‘soil’	<i>perpera</i>	‘dirty’
<i>?ele</i>	‘near’	<i>?el?ele</i>	‘shallow’
<i>nočo</i>	‘straight’	<i>nonočo</i>	‘correct’

The suffix *-ŋa* derives nouns from verbs, especially locatives and instrumentals:

<i>fomu</i>	‘bury’	<i>fomu-ŋa</i>	‘grave’
<i>a?lele</i>	‘judge’	<i>a?lele-ŋa</i>	‘court’
<i>hako</i>	‘climb’	<i>hakhako-ŋa</i>	‘ladder’
<i>kukulu</i>	‘cover’	<i>kukulu-ŋa</i>	‘blanket’

Common elements in compound nouns include *le?* ‘person’, *tē* ‘thing’, *rē* ‘do, make’ and the ‘genitive’ particle *-ne-*:

<i>le?-rako</i>	‘person-learn’ = ‘student’
<i>le?-hana?o</i>	‘person-steal’ = ‘thief’
<i>tē-la-?ā</i>	‘thing-to-eat’ = ‘food’
<i>tē-?ona</i>	‘thing-intoxicating’ = ‘intoxicating drink’
<i>tē-ŋaruŋa</i>	‘thing-work’ = ‘tool’
<i>fā-rē-veko</i>	‘man-make-garden’ = ‘farmer’
<i>le?-rē-rako</i>	‘person-make-learn’ = ‘teacher’
<i>fɔ?-ne-mafa</i>	‘back-of-eye’ = ‘eyelid’
<i>palaŋ-ne-isu</i>	‘hole-of-nose’ = ‘nostril’
<i>faliaŋ-ne-?atua</i>	‘ear-of-devil’ = ‘mushroom’

The most common verbal prefix is *a?*-, which forms causatives, adverbs, etc.:

<i>lelei</i>	‘good’	<i>a?-lelei-a</i>	‘heal’
<i>mauri</i>	‘alive’	<i>a?-mauri</i>	‘save’
<i>rua</i>	‘two’	<i>a?-rua</i>	‘twice’

The reciprocal prefix is *hɔi-*:

<i>feke</i>	‘angry’	<i>hɔi-feke-na</i>	‘quarrel’
<i>pelu</i>	‘fight’	<i>hɔi-pelu-na</i>	‘fight each other’

---

---

## 76. Tongan

---

---

<b>Contributor:</b>
---------------------

Introduction and wordlist: <i>Paul Geraghty</i>
---

---

### 1. Introduction

---

Tongan is the main language of the kingdom of Tonga, spoken by about 100,000 in Tonga, and perhaps 30,000 migrants and their families in New Zealand, Australia, United States, Canada, Samoa, Fiji, Niue etc. The only part of Tonga where a language other than Tongan is spoken is on the northernmost island, Niuafu'ou, the language of which is Samoic. The previously Samoic language of its neighbour, Niuatoputapu, has now almost completely assimilated to Tongan. Geographically, the language is fairly uniform, only very minor lexical differences existing between the three main island groups, Tongatapu (which includes the main island and Nuku'alofa, the seat of government), Ha'apai, and Vava'u. This wordlist was compiled by the author using Churchward's dictionary, and corrected and expanded by Melenaita Taumoefolau of the University of Auckland, a native speaker of Tongan and PhD student in linguistics. Tongan is said to be mutually intelligible with East Uvean, and is closely related historically to Niuean, with which it forms Tongic, one of the two main branches of the Polynesian language family.

### 2. History of research

---

Tonga was one of the earliest Pacific island groups to be exposed to Western influence, being a favourite haunt of Cook, who named them the "Friendly Islands". As a result, a number of Tongan wordlists were published in the various accounts of Cook's voyages, and at least one Tongan word entered the English language – *taboo* from Tongan *tapu*.

The first attempt at a complete description of Tongan had a most unusual origin. William Mariner, a young Englishman, survived the massacre of the crew of the *Port au Prince* in 1806, was adopted into one of the royal families of Tonga, and lived there for four years. On his return, his account of his experiences was transformed into a book by John Martin, who also

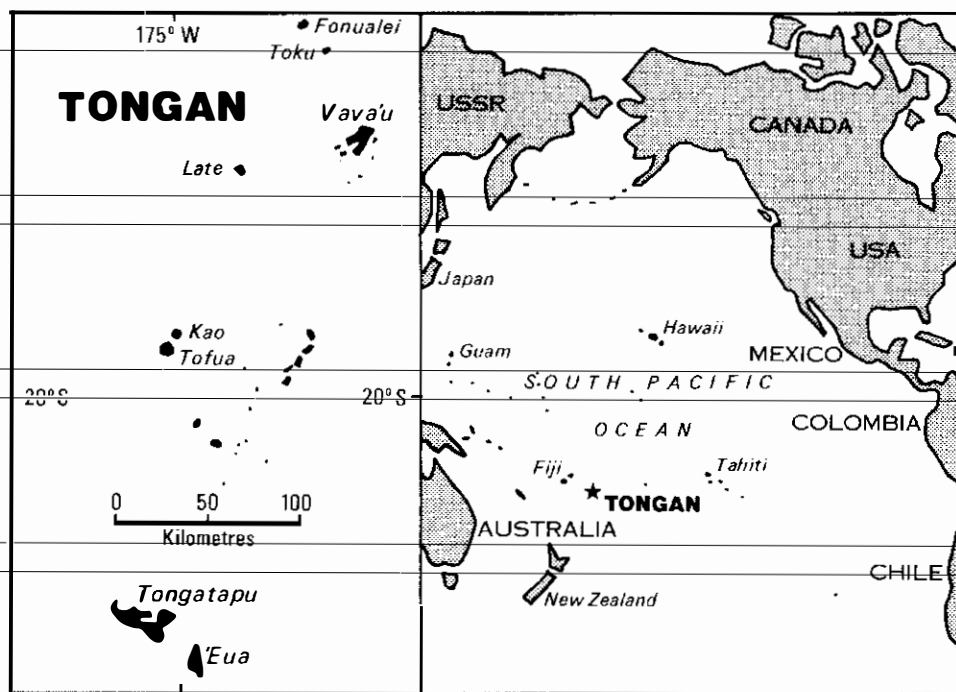

---

---

turned Mariner's implicit knowledge of Tongan into a quite substantial and surprisingly accurate grammar and dictionary (Martin 1817).

Wesleyan missionaries established themselves in Tonga in 1826, and 1828 saw the publication of a short primer by Nathaniel Turner, followed by Rabone's dictionary of 1845 and West's grammar of 1865. French Catholic missionaries of the Marist order arrived later, and produced a grammar and dictionary in French in 1890 (Colomb 1890). Rabone's work formed the basis for Baker's grammar and dictionary of 1897, which, though supplemented by Collocott in 1925, remained the standard reference work until the publication of Churchward's Grammar in 1953 and his Dictionary in 1959. A more recent, though unpublished, grammar is Morton 1962, and Shumway 1971 is an excellent course in spoken Tongan.

Map 76. Tongan language area

### 3. Orthography

As in Rotuma, the Methodists and Catholics developed slightly different orthographies. The currently accepted orthography follows that laid down by the Privy Council of Tonga in 1943 (Churchward 1953: viii-ix). Notably, glottal stop is marked by an inverted apostrophe, and velar nasal by the digraph *ng*, rather than the *g* used in the neighbouring languages of Fiji, Rotuma, Samoa etc.

#### 4. Phonology

The segmental phonemes of Tongan are as follows:

Table 1. Consonants

	Bilabial	Labio-dental	Dental	Alveolar	Velar	Glottal
Stops	<i>p</i>		<i>t</i>		<i>k</i>	<i>ʔ</i>
Fricatives	<i>vl</i> <i>vd</i>	<i>f</i> <i>v</i>	<i>s</i>			<i>h</i>
Nasals	<i>m</i>		<i>n</i>		<i>ŋ</i>	
Laterals			<i>l</i>			

plus the usual five vowels, with distinctive length. All syllables are of the shape CV or V. Accent is usually penultimate, long vowels being reckoned as two syllables, but occurs on the final syllable of definite noun phrases. The stops are unaspirated. The /l/ phoneme is realised by some speakers as a flap intervocally.

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a a</i>	

Unstressed /a/ is often raised in the environment of a non-low vowel, a rule which yields morphophonemic alternation in reduplications, e.g. *pelepela*, *monumanu*, *hinehina*, and compounds, e.g. *taʔe* 'excrement', *teʔe-lajo* 'fly's excrement, wax, candle'.

#### 5. Morphology

Compound nouns usually consist of noun + verb, noun + noun, or noun + *ʔi* + noun. Examples:

<i>vai-tafe</i>	water-flow	= 'river'
<i>manu-puna</i>	animal-fly	= 'bird'
<i>hele-kosi</i>	knife-cut	= 'scissors'
<i>fale-koloa</i>	house-goods	= 'store'
<i>hui-vakavaka</i>	bone-side	= 'rib'
<i>mui-fonua</i>	extremity-land	= 'headland'
<i>ʎeʎesi-nima</i>	shell-hand	= 'fingernail'
<i>kakano-ʎi-manu</i>	flesh-of-animal	= 'meat'
<i>ava-ʎi-ihu</i>	hole-of-nose	= 'nostril'
<i>kili-ʎi-ʎakau</i>	skin-of-tree	= 'bark'
<i>foʎi-manu (&lt;fuaʎi-)</i>	fruit-of-animal	= 'egg'

A common instrument-forming prefix is *meʎa* 'thing', and *taʎata* 'man' forms many agentives:

<i>meʎa-kai</i>	thing-eat	= 'food'
<i>meʎa-ʎāue</i>	thing-work	= 'tool'
<i>meʎa-tau</i>	thing-fight	= 'weapon'
<i>taʎata-tui-sū</i>	man-sew-shoe	= 'cobbler'
<i>taʎata-tau</i>	man-fight	= 'soldier'

Two noun-forming suffixes are met with in the data, *-ʎaʎa*, which usually indicates place, and *-ʎa*, which indicates instrument or result:

<i>ako</i>	'learn'	<i>ako-ʎaʎa</i>	'school'
<i>fakatau</i>	'trade'	<i>fakatau-ʎaʎa</i>	'market'
<i>mohe</i>	'sleep'	<i>mohe-ʎa</i>	'bed'
<i>toe</i>	'remain'	<i>toe-ʎa</i>	'remains'
<i>putu</i>	'close together'	<i>putu-ʎa</i>	'a crowd'

The most common verbal prefix is *faka-*, which usually marks causative or intensive:

<i>moʎui</i>	'healthy, alive'	<i>faka-moʎui</i>	'cure'
<i>moho</i>	'cooked'	<i>faka-moho</i>	'cook'
<i>tuai</i>	'slow'	<i>faka-tuai-ʎi</i>	'delay'
<i>fanoʎo</i>	'hear'	<i>faka-fanoʎo</i>	'listen'

Transitive suffixes *-ʎi* (by far the most common), *-si*, *-hi*, and *-ʎi* are separated from their bases by a hyphen.

Tongan sentences are rigidly verb-initial, with a tense-marker and subject pronoun obligatorily preceding the verb.

## 6. Lexicon

Tongan has a long tradition of use in education and development, and much of the lexical enrichment required has been achieved through the use of indigenous materials and processes. Nevertheless, although never a colony, Tongan has long existed in the Commonwealth sphere of influence, and the overwhelming majority of loan-words are from English. A sizeable minority, however, originates from Fijian, reflecting the protracted intercourse between the two groups in the eighteenth and nineteenth centuries. Other sources of loan-words are Samoan, Latin, French, and Spanish.

## 77. Samoan

---

---

<b>Contributor:</b>
---------------------

Introduction and Wordlist : <i>Ulrike Mosel</i>
---

---

---

### 1. Introduction

---

---

Samoan is a Polynesian ergative language, which is spoken by most of the 160,000 inhabitants of Western Samoa, the 34,000 inhabitants of American Samoa, and by Samoan immigrants in New Zealand, Australia, Hawaii and California. Within the Polynesian languages, Samoan belongs to the Samoic-Outlier group of Nuclear Polynesian.

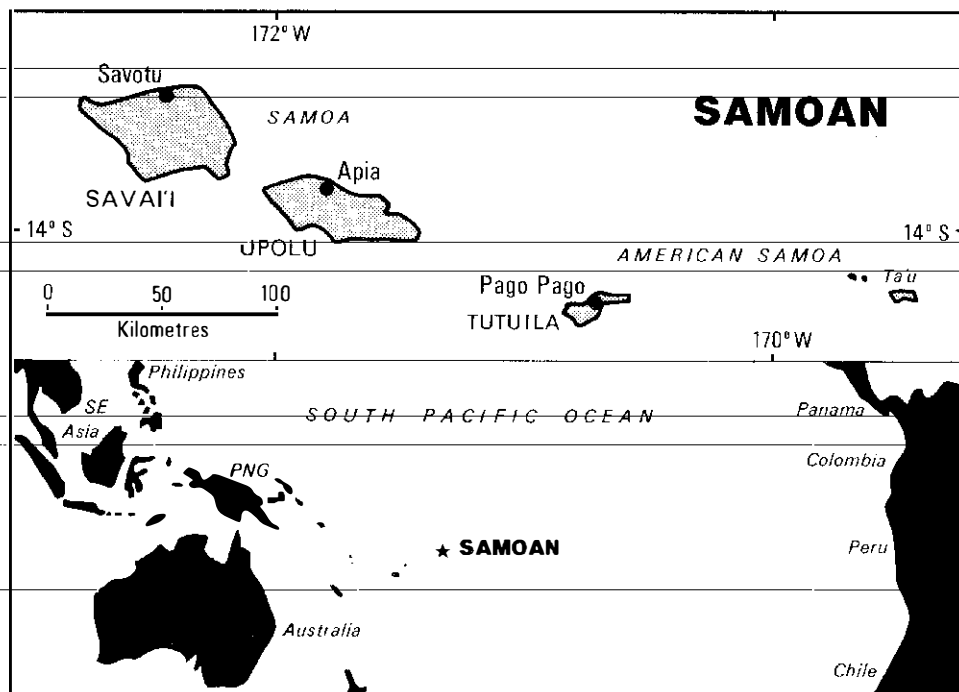

The degree of regional variation is too small to speak of separate dialects. But there are two sociolects, the standard language (*tautala lelei* 'good language') and the colloquial language (*tautala leaga* 'bad language'), which considerably differ in their phonology, morphology and syntax. Standard Samoan is used in poetry, songs, written Samoan, in prayers and during Church services, on the radio, in school, and when talking to Europeans. Furthermore, the lexicon contains a large number of so-called "polite words", which have to be used when talking about or addressing high-ranking persons.

The present word list is based on Milner (1966), Pratt (1911 [1977]), Hovdhaugen (1987) and my own data which I collected during fieldwork in Western Samoa in March-September 1985, October-November 1987, and April 1988. My research on the Samoan language has been financed by the Deutsche Forschungsgemeinschaft (German Research Society) since May 1984.

The word list indicates the word class membership of each word, as there are considerable differences in this respect between Samoan and English or French. There are, for instance, hardly any adjectives in Samoan. Most notions expressed by adjectives in English or French are signified by intransitive verbs, which, as with any other verbs, can be used predicatively and attributively. Furthermore, all verbs can be used in the function of verbal nouns denoting actions or other states of affairs.

---

---

Map 77. Samoan language area

## 2. Phonology

### 2.1 Word stress

Stress falls on the penultimate syllable of the word.

### 2.3 Inventory of consonants

Standard Samoan (*tautala lelei*) has 13 consonants. /k/, /h/, and /r/ only occur in loanwords and interjections:

Table 1. Standard Samoan consonants

		Bilabial	Labio-dental	Alveolar	Velar	Glottal
Stops	vl	<i>p</i>		<i>t</i>	( <i>k</i> )	ʔ
Fricatives	vl		<i>f</i>	<i>s</i>		( <i>h</i> )
	vd		<i>v</i>			
Nasals		<i>m</i>		<i>n</i>	<i>ŋ</i>	
Laterals				<i>l</i>		
Flaps				( <i>r</i> )		

Colloquial Samoan (*tautala leaga*) only has ten consonants:

*Table 2.* Colloquial Samoan consonants

		Bilabial	Labio-dental	Alveolar	Velar	Glottal
Stops	vl	<i>p</i>			<i>k</i>	ʔ
Fricatives	vl		<i>f</i>	<i>s</i>		( <i>h</i> )
	vd		<i>v</i>			
Nasals		<i>m</i>			<i>ŋ</i>	
Laterals				<i>l</i>		

/k/ in Colloquial Samoan corresponds to both /t/ and /k/ in Standard Samoan, /ŋ/ to both /n/ and /ŋ/, and /l/ to both /l/ and /r/.

### 2.3 Inventory of vowels

Samoan has a five vowel system. Vowel length is distinctive:

*Table 3.* Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a ā</i>	

There are six diphthongs in Samoan: /ei, eu, ai, au, oi, ou/. Other sequences of qualitatively different vowels constitute separate syllables.

### 2.4 Syllable structure

The syllable has the structure CV, C $\bar{V}$ , V or V $\bar{V}$ . In word final position the sequence C $\bar{V}$  has to be interpreted as two syllables, namely CV + V. Consonant clusters in loanwords are split up by epenthetic vowels in Samoan, e.g. *aisakulimi* 'ice-cream'.

### 3. Orthography

The Samoan practical orthography is phonological except that vowel length and the glottal stop are usually not indicated. The velar nasal is rendered by *g*, the glottal stop by ‘, and the flap by *r*.

## 78. Mele-Fila

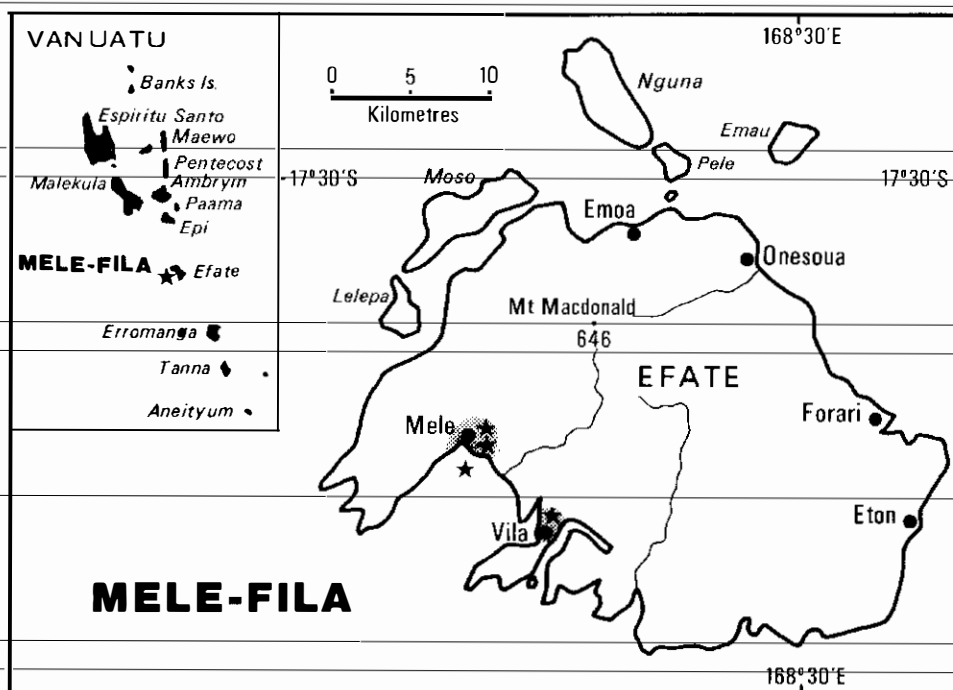

**Contributor:**

**Wordlist and Introduction:** *Ross Clark*

### 1. Introduction

Mele-Fila is a Polynesian language spoken by about 1800 people in two villages in central Vanuatu. The villages are situated about 7 km apart on the south-west coast of the island of Efate, near the capital, Port Vila. Mele (Imere) has about 1200 speakers, and Fila (Ifira) about 600 (1979 census figures).

There are numerous small points of difference between the Mele and Fila dialects in all areas of linguistic structure. Thus a speaker can be quickly identified as coming from one village or the other, but will be understood without difficulty by speakers of the other dialect. The forms given in the present list are those of the Mele dialect.

Map 78. Mele-Fila language area

Little has been written about this language. Apart from early missionary wordlists, the first descriptive work is a paper by Capell (1942), based on work with a single Fila speaker in Fiji. Biggs (1975) is a compilation of vocabulary collected by Biggs, Elbert, Capell and others. Early results of my own fieldwork were summarised in a working paper (Clark 1975a). There are also some texts (Clark 1975b, 1991), and a translation of the Bible into the Fila dialect is in progress (Mark 1981). The present list is based on material collected by me at Mele between 1974 and 1986. My principal informant has been Edwin Nganga.

Mele-Fila has borrowed a substantial proportion of its vocabulary from the neighbouring Efate dialects. In recent times it has also acquired many words from English and French via Bislama, a variety of Melanesian Pidgin which is the lingua franca and national language of Vanuatu.

## 2 Phonology

### 2.1 Word stress

Stress falls on the antepenultimate vowel of a word. (Long vowels count as two for purposes of this rule.) Except for a few particles, a Mele-Fila word contains a minimum of three vowels. Thus lexical morphemes cited in this list which have only two vowels are bound forms, and will always occur (in text or in citation) with an attached grammatical morpheme. Thus *fare* 'house' will appear as *'te-fare* 'the house'; *'a-fare* 'the houses', etc.

### 2.2 Consonants

Mele-Fila has fifteen consonant phonemes.

*Table 1.* Consonants

	Labial	Labialised labial	Alveolar	Alveo-palatal	Velar
Stops/Affricates	<i>p</i>	<i>p<sup>w</sup></i>	<i>t</i>	<i>ç</i>	<i>k</i>
Fricatives	vl vd	<i>f</i> <i>v</i>	<i>s</i>		
Nasals	<i>m</i>	<i>m<sup>w</sup></i>	<i>n</i>		<i>ŋ</i>
Laterals			<i>l</i>		
Flaps			<i>r</i>		
Semivowels		<i>w</i>			

### 2.2.1 Discussion

/č/ is a voiceless alveopalatal affricate which is largely in complementary distribution with /t/ - /č/ occurring before /i/ and /t/ elsewhere. Recent borrowings, however, have extended both consonants into other environments (e.g. *ratiō* ‘radio’, *činčā* ‘ginger’), so that they must now be considered distinct phonemes.

The labiovelars /p<sup>w</sup>/ and /m<sup>w</sup>/ are bilabials with a greater or lesser degree of velarisation. In the Fila dialect they are not distinguished from the plain labials.

/r/ is a light alveolar flap, with some tendency toward retroflexion.

### 2.3 Vowels

Mele-Fila has five vowel phonemes:

Table 2. Vowels

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a ā</i>	

These vowels may be long or short. Vowel length has a fairly high functional load in Mele-Fila, and minimal contrasts are not hard to find, e.g. *mara* ‘bitter’, *māra* ‘garden’, *mārā* ‘eel’.

### 2.4 Notes on the shape of words and syllables

Mele-Fila syllables are predominantly of the form (C)V, but (C)VC is also permitted. The vast majority of words end in a vowel, but a few recent loans are consonant final: compare *čipōto* ‘teapot’ with *nōt* ‘north’. All consonants occur in geminate clusters, and consonant gemination functions as a mark of plurality in many intransitive verbs, e.g. *nofo* ‘sit (sg)’, *nnofo* ‘sit (pl)’. Non-geminate clusters of two consonants occur, of the following types:

Resonant + Obstruent: *sikontasi* ‘sea bird sp.’, *kinčia* ‘pinch’, *aŋkiči* ‘type of cloth’, *pensila* ‘pencil’, *varsia* ‘scrape’, *m<sup>w</sup>altōa* ‘dove sp.’

Fricative + Stop: *sikispēni* ‘small coin’, *kastava* ‘shellfish sp.’.

# 79. Tahitian

**Contributor:**

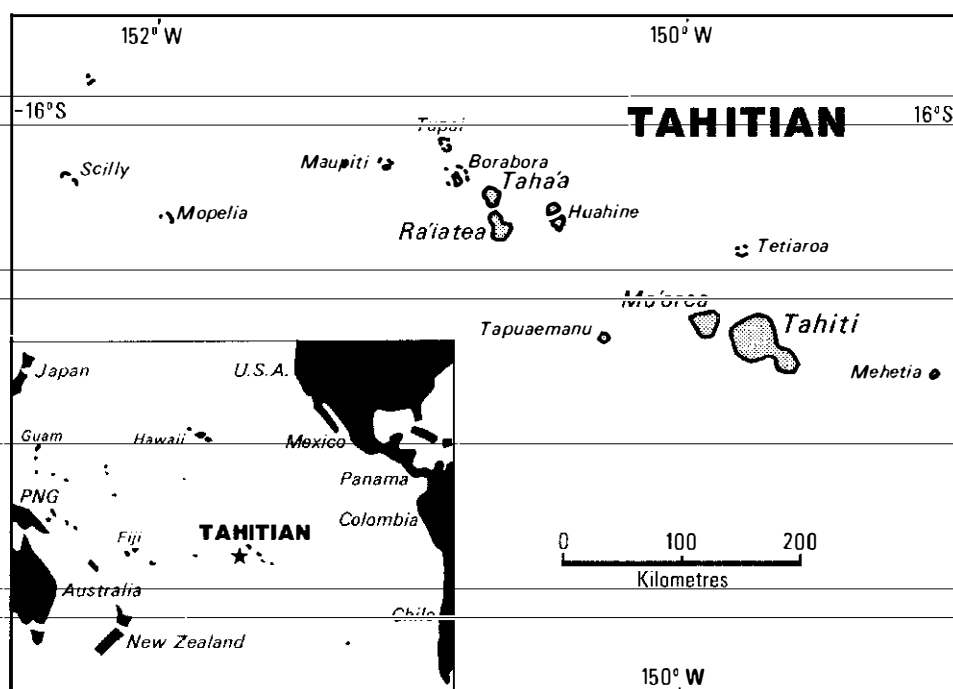

Wordlist and Introduction: *Yves Lemaître*

## 1 Demographic data

Tahitian is spoken by approximately 115,000 speakers, or 69% of the total population of 166,753 inhabitants of French Polynesia. This information is based on statements made by persons surveyed in the 1983 Census.

The area of origin of the Tahitian language is that of the Society Islands, also the most densely populated area, with 85% of the population of the whole territory. Within the Society Islands there are minor dialect variations between the Leeward and Windward Islands.

In the other archipelagoes which make up the territory the local languages are generally Polynesian languages distinct from Tahitian. However, Tahitian is widely used in these islands as a vehicle for external communication. Besides this, radio and television broadcasts in Tahitian have a wide audience.

Map 79. Tahitian language area

Knowledge of Tahitian among the inhabitants of the territory depends on geographical factors, but also on ethnicity. The population consists mainly of Polynesians 69%, Europeans 12%, Chinese 4% and Polynesian mixed-race 14%. These last named are persons born of the union between Polynesians and persons of a different ethnic group. The proportion of individuals claiming to speak Tahitian varies greatly according to ethnic group: 80% of Polynesians, 73% of Polynesian mixed-race, 67% of Chinese and 6% of Europeans.

## 2. Phonology

### 2.1 Consonants

There are nine consonant phonemes, as follows:

*Table 1.* Consonants

	Labial	Labio-dental	Dental	Glottal
Stops	<i>p</i>		<i>t</i>	<i>ʔ</i>
Fricatives	<i>v</i> <i>vd</i>	<i>f</i> <i>v</i>		<i>h</i>
Nasals	<i>m</i>		<i>n</i>	
Trills			<i>r</i>	

The realisation of the consonants /h/ and /ʔ/ is regularly anticipated in the sequences /CV<sub>1</sub>hV<sub>2</sub>/ or /CV<sub>1</sub>ʔV<sub>2</sub>/ when the vowel sequence V<sub>1</sub>V<sub>2</sub> is a descending one. The effect is particularly noticeable after a stop: *tahi*, 'one', is realised as [t<sup>h</sup>ai] and *taʔi* 'cry' is realised as [t<sup>ʔ</sup>ai/.

### 2.2 Vowels

Vowel phonemes: there is a series of five short vowels /i/, /e/, /a/, /o/, /u/ opposed to a series of five long vowels [ī], [ē], [ā], [ō], [ū] which may be analysed phonologically as a sequence of two short vowels.

Table 2. Vowels

	Front	Central	Back
High	<i>i</i>		<i>u</i>
Mid	<i>e</i>		<i>o</i>
Low		<i>a</i>	

Syllables are open, of canonical shape (C)V(V). There are no restrictions on choice of consonant or vowels. There are, therefore, 25 diphthongs and long vowels resulting from the pairing of the different vowels. However, the realisation of phonemes is largely modified by phonological environment. Thus in *t̄oi* ‘turn’ the vowel /o/ is closed and centred, while that in *pao* ‘dig’ is open and backed

### 2.3 Stress

All words are stressed except certain grammatical words having only a short vowel / (C) V/. The principal stress falls:

- on the last syllable containing a long vowel;
- on the last syllable containing a diphthong;
- on the penultimate short vowel.

Examples:

/tapu/	‘forbidden’	[ˈta.pu]
/tāpū/	‘cut’	[tā.ˈpū]
/maraʔamu/	‘trade wind’	[ma.ra.ʔa.mu]
/vahine/	‘woman’	[va.ˈhi.ne]
/taura/	‘rope’	[ˈtau.ra]
/tāura/	‘traditional priest’	[ˈtā.u.ra]
/ʔanotau/	‘era, period’	[ʔa.no.ˈtau]
/mātau/	‘know’	[ˈmā.tau]
/tāhōʔē/	‘unite’	[tā.hō.ʔē]

- The consonants /ʔ/ and /h/ also displace stress:

/maha/	‘four’	/ma.ˈha]
--------	--------	----------

### 3. Morphology and syntax

#### 3.1 Word formation

Statistically words of the type (C)V(C)V occur more frequently than others in the lexicon. Root morphemes used in compounds are generally of the same shape as that listed above. Examples:

*pohe* 'die'; *haʔapohe* 'kill, play dead'; *tūpohe* 'extinguish'; *pohemaʔi* 'be ill' (from *maʔi* 'illness').

Partial or complete reduplication is a common process in word formation: *pohepohe* 'die (of several persons)'.

Words are invariable; morphological changes, concord and morphophonemic change do not occur. Consequently a single linguistic form often corresponds to several grammatical units, such as verbs, nouns, adjectives. Examples:

*arataʔi* 'guide, to guide'; *arofa* 'greeting, to greet'; *ora* 'life, live, living'.

#### 3.2 Syntagmatics

In any clause containing a finite verb, the usual word order is:

V S O (verb : subject : object)

Thus:

*ʔamu atura : te ariʔi : i te ʔuru*  
(eat past distant art king comp breadfruit)

'The king ate the breadfruit.'

Different word order is possible accompanied by meaning changes such as highlighting or change of theme.

In non-verbal sentences, the subject normally follows the nominal predicate. Thus:

*e faʔehau teie taʔata*  
(art soldier this man)

This man is a soldier.

#### 3.3 Grammatical particles

The grammatical particles associated with sentence constituents such as V S or O either precede or follow the head word in a fixed order. Verbal and

nominal constituents may be distinguished syntactically by associated grammatical particles.

The ordering of particles in a given sentence constituent can largely be explained in the following simple model. The place of a particle depends on the class to which it belongs. Two particles belonging to the same class are incompatible within the same constituent. Particle classes as a whole occur in a fixed relative order within the sentence constituent.

### 3.3.1 Table of particles preceding any noun head

Table 3. Particles preceding noun head

1 functors		2 articles		3 definition	
<i>i</i>	complement	<i>te/te-</i>	general	<i>hea</i>	where
<i>nā/nō</i>	possessive	<i>nā</i>	plural	<i>tahi</i>	a certain
	predicate	<i>e</i>	indefinite	<i>hōʔē</i>	a certain
<i>tei/ei/i</i>	locative				
	predicate				
4 position		5		6	
<i>-ie/nei</i>	near speaker	<i>ia</i>	anaphoric	<i>mau</i>	plural
<i>na</i>	near addressee			<i>tau</i>	restricted plural
<i>ra</i>	near 3rd person			<i>maʔa</i>	some, a few
<i>reira</i>	anaphoric				
<i>-aua</i>	anaphoric				

Table 4. Particles preceding verb head

Tense/mode/aspect

<i>ʔa</i>	inceptive/imperative
<i>ʔua/i</i>	perfective
<i>e</i>	imperfective
<i>i</i>	past
<i>ʔia</i>	subjunctive
<i>te</i>	progressive

### 3.3.3 Table of particles following any noun or verb head

Table 5. Particles preceding noun or verb head

1		2		3
<i>noa</i>	only, continually	<i>atoʔa</i>	all, also	<i>anaʔe</i> only, all
<i>roa</i> (vb)	intensely			
<i>mā</i> (np)	and company			
4		5		6
<i>raʔa</i> (vb)	nom	<i>hia</i> (vb)	passive	<i>mai</i> movement towards (speaker)
				<i>atu</i> movement away
				<i>iho</i> downwards
				<i>aʔe</i> upwards
7		8		9
<i>nei</i>	near	<i>ānei</i>	interrogative	<i>ā</i> again, still
<i>na</i>	near you	<i>rā</i>	but	
<i>ra</i>	far			
<i>ai</i> (vb)	there, then			
10		11		
<i>paha</i>	perhaps	<i>hoʔi</i>	also, however, precisely	

(vb) after a verb

(np) after proper noun

### 3.4 Negation

Negation of affirmative sentences is effected by the use of negative verbs.

Thus:

*e faʔaroʔo mai ʔoe*  
(imp listen near you)

‘You will listen.’

*eʔita ʔoe e faʔaroʔo mai*  
 (imp not do you imp listen near)

‘You will not listen.’

*ʔeiaha ʔoe e faʔaroʔo mai*  
 (prohib you imp listen near)

‘You must not listen.’

### 3.5 Subjects

Grammatical subjects may be understood, and not specified. Example:

*ʔua topa*  
 (perf fall)  
 He fell.

## 80. Rapa Nui

---

---

<b>Contributors:</b>
----------------------

Introduction and Wordlist : <i>Robert L. Weber – Nancy L. Weber</i>
---

---

---

### 1. Introduction

---

Rapa Nui is the Polynesian language spoken by the native inhabitants of the Oceanic Province of Isla de Pascua (Easter Island, 27° S, 109° W), Republic of Chile. The Rapa Nui language has often been referred to in previous ethnographic and linguistic literature written in Spanish and English by the names *Pascuense* and *Easter Island*, respectively. Most Easter Islanders, however, prefer the name *Rapa Nui* when referring to their language, and also to themselves and to their island. Sociologist Grant McCall (1986 personal communication) estimates the Rapa Nui people to number 2,645 individuals, approximately 1,717 of whom reside on Easter Island. Another more mobile group of roughly 692 persons resides on the Chilean mainland either working or pursuing a secondary education for themselves or for their children. Yet another 236 individuals live in Tahiti and other countries for much the same reasons. However, not all Rapa Nui – not even all who reside on the island – are speakers of the language. The number of Easter Islanders who actually speak Rapa Nui as their first or predominant language is not known.

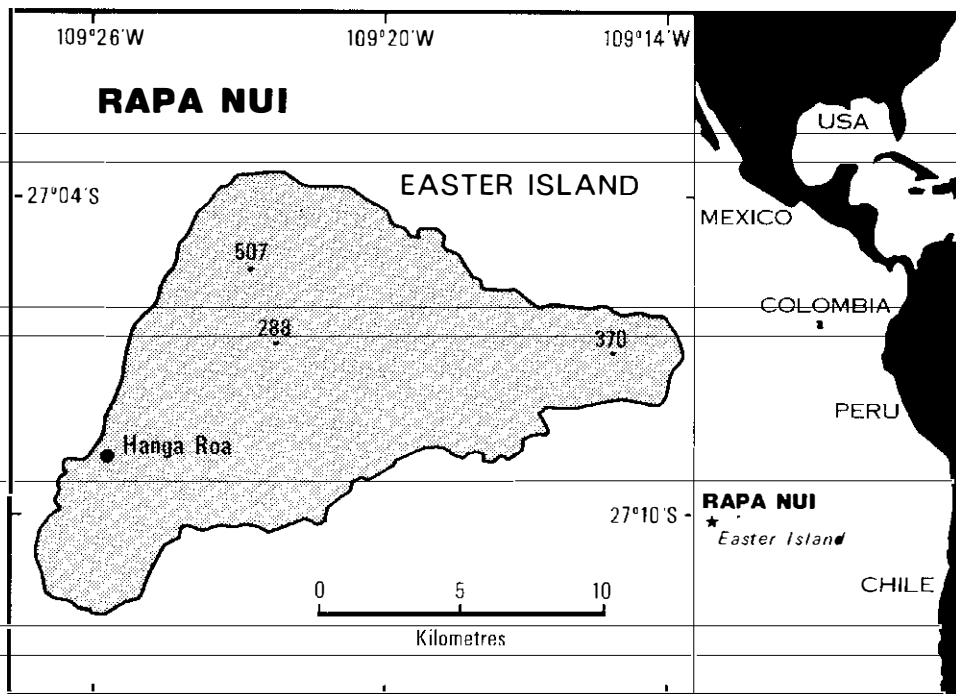

The earliest contributions to the study of Rapa Nui consist of short word lists and transcribed traditional texts obtained either for their relevance to the understanding of prehistory and ethnography or for linguistic study and preservation of samples of the language as it was spoken prior to change brought on by increasing contact with outsiders. These contributions include: Aguera e Infanzón (1770 [1980]), Gaceta de Lima (1771), Forster (1774), Cooke (1899), Roussel (1908), Martínez (1913), Englert (1938, 1939, 1948, 1974), and Métraux (1940).

The first major lexicographic and descriptive work on Rapa Nui was accomplished by Englert, who, as the island's Roman Catholic priest for many years, lived among the people and learned to speak their language. His dictionary and grammar (1978, previous editions 1938 and 1948) is still regarded by scholars as fundamental. Fuentes' (1960) grammar and

---

---

dictionary is an attempt to describe the more modern language without avoidance of influences from other languages.

Map 80. Rapa Nui language area.

The data for this wordlist have largely been drawn from an extensive and varied corpus of text and elicited material recorded by the authors since the beginning, in 1977, of their residence and research on Easter Island. Reference has also been made to the extant dictionaries – in particular those of Englert and Fuentes – but any forms taken from such sources have been checked with present-day speakers and are rewritten to more accurately indicate phonemic glottal stops and vowel length. The *Programa Lengua Rapa Nui* (Rapa Nui Language Project), of which the authors are investigators, is co-sponsored by the Universidad Católica de Valparaíso, Chile and the Summer Institute of Linguistics, and functions to contribute to the knowledge of the Rapa Nui language, promote its written use, and collaborate in the preservation and maintenance of the Rapa Nui people's linguistic heritage. Work in progress by the Project includes: (1) the linguistic analysis and description of modern Rapa Nui; (2) the promotion of reading and creative writing in Rapa Nui through the development of language arts textbooks, training of islander school teachers, etc.; and (3) the fostering of a literature in Rapa Nui through the training of local authors, literature production workshops, and the like.

The transcription used in the wordlist differs somewhat from the practical orthography that has been adopted by Rapa Nui authors and that used in the language arts textbook series. The entries in the word list are written using the following symbols /a ā e ē i ī o ō u ū p t k ʔ m n ŋ v h r/. In the practical alphabet, the vertical apostrophe symbol ‘’ represents the glottal stop /ʔ/, and the symbol ġ (easily typed on a Spanish keyboard, and distinct from the Spanish letter *g*) represents the velar nasal /ŋ/.

To facilitate the correct intonation of words derived by reduplication, in the practical writing of Rapa Nui a hyphen (-) is used to separate the reduplicated part(s). In the word list, hyphen is also used (although somewhat inconsistently) to indicate other morpheme breaks.

Known loanwords are identified in the word list by square brackets. Possible loanwords are identified in the footnotes where possible. The source, or possible source, languages are given in the notes. However, there are undoubtedly many more loanwords of Tahitian, Mangarevan, etc., origin than are indicated in the word list. During the nineteenth century there were several instances of the removal of Rapa Nui people from Easter Island and their later repatriation after living a number of years in the islands of French Polynesia. In the later part of the same century, French businessmen took a group of Tahitian labourers to work on their Easter Island sheep ranch.

## 2. Phonology

Rapa Nui, like other Polynesian languages, has a relatively simple, straightforward phonology.

### 2.1 Inventory of segments

The inventory of distinctive segments consists of five short vowels, five corresponding long vowel, and ten consonants.

### 2.2 Consonants

Table 1. Consonants

	Bilabial	Labio-dental	Alveolar	Velar	Glottal
Stops	<i>p</i>		<i>t</i>	<i>k</i>	<i>ʔ</i>
Fricatives		<i>v</i>			<i>h</i>
Nasals	<i>m</i>		<i>n</i>	<i>ŋ</i>	
Vibrants			<i>r</i>		

## 2.3 Vowels

*Table 2. Vowels*

	Front	Central	Back
High	<i>i ī</i>		<i>u ū</i>
Mid	<i>e ē</i>		<i>o ō</i>
Low		<i>a ā</i>	

## 2.4 Syllable structure

The syllable consists of (C)V, a single long or short vowel optionally preceded by a consonant. Hence Rapa Nui allows only open syllables and there are no consonant clusters, although within the word any combination of vowels is possible. However, each vowel of a vowel cluster strictly constitutes a separate syllable; Rapa Nui has no diphthongs (Weber – Thiesen de Weber 1982).

## 2.5 Word stress

All polysyllabic words are stressed according to the following rules: (1) if the last vowel of the word is a long vowel, the word is pronounced with stress on the final syllable. (2) if the last vowel of the word is not a long vowel, the word is pronounced with stress on the penultimate syllable. The vowels of all monosyllabic words having lexical content are long and stressed. By contrast, the vowels of monosyllabic grammatical particles are short and unstressed, with the exception noted in the next paragraph.

## 2.6 Phrase stress

Just as Biggs (1969: 17) reports for Maori, “each phrase is said with a single intonation contour, the voice rising to a point of intensity which is called the phrase stress”. In Rapa Nui, the peak of this intensity falls on the final particle or word of the grammatical phrase, on the syllable determined by the rules given above for word stress. Phrase stress is pronounced with even greater intensity than word stress, and whenever it occurs on a monosyllabic grammatical particle it lengthens the vowel of that particle. By way of

interest, in the practical writing of their language, Rapa Nui authors have chosen to write as long vowels the normally short, unstressed vowels of monosyllabic grammatical particles when these are pronounced long as a consequence of their occurrence in the phrase stress position of a phrase.

## 7. A glossary of Austronesian reconstructions

---

---

Reconstructions: *R. David Zorc*

Editing, introduction and finder list: *Malcolm D. Ross*

---

---

### Introduction

---

---

This glossary contains some 1650 reconstructions for high-order Austronesian proto languages, supplied from his data base by R. David Zorc, and an English finder list to the reconstructions. These reconstructions are provided here for readers' reference and to give an indication of how far the task of reconstruction had progressed at the time of publication. The task of reconstruction, at least for a large language family, is never complete, as new data are always leading to refinements. Hence the reconstructions here represent Zorc's current understanding, contained in a data base which is continually updated, and entail certain conventions which encapsulate unanswered questions. These are discussed below.

Zorc (pers. comm.) points out that, although the shapes of the reconstructions are generally his own, they owe much to the scholarly research of Robert A. Blust and others.

Each reconstruction is labelled either PAN, PMP, PHF or PHN. PAN and PMP are Proto Austronesian and Proto Malayo-Polynesian respectively, as discussed in Chapters 2 and 3 and shown in Figure 1. PHF and PHN stand for 'Proto Hesperonesian-Formosan' and 'Proto Hesperonesian', cover terms used by Zorc to indicate that the proto etymon is reflected in a narrower range of languages than PAN and PMP. Items labelled PHF are reflected in Formosan and Western Malayo-Polynesian languages, those labelled PHN only in Western Malayo-Polynesian languages. In the terms of Figure 1, items labelled PHF and PHN are reconstructible for Proto Austronesian and Proto Malayo-Polynesian respectively, but had been lost in Proto Central/Eastern Malayo-Polynesian. However, the labels capture this narrower distribution of reflexes and respect the hypotheses of those Austronesian scholars who do not accept Blust's subgrouping hypothesis and who hold that (a) the Western Malayo-Polynesian languages constitute a genetic subgroup, and (b) that this grouping and the Formosan languages form an exclusive higher-order subgroup.

---

---

## Reconstructions

PAN	* <i>a</i>	and, with
PHN	* <i>a(m)bék</i>	mat
PHN	* <i>abu?</i>	grandfather
PHN	* <i>a+búg</i>	dust
PHN	* <i>a(m)buŋ</i>	proud, haughty
PHN	* <i>a(m)buqaŋ</i>	beetle
PMP	* <i>abus</i>	ashes
PMP	* <i>a(m)+but</i>	weed, pluck, pull out
PAN	* <i>a-(n)d<sub>2</sub>ak</i>	ascend, climb
PHF	* <i>adaduq</i>	long (object) [cf: * <i>anaduq</i> ]
PMP	* <i>ad<sub>2</sub>amay</i>	plant, <i>Pipturus argenteus</i>
PHF	* <i>ǎduq</i>	many
PHF	* <i>a-eném</i>	six
PAN	* <i>-aH</i>	[imperative suffix]
PMP	* <i>aha?</i>	see
PMP	* <i>ájan</i>	name
PMP	* <i>aka</i>	older sibling
PMP	* <i>akaR</i>	root [dbl: * <i>wakaR</i> ]
PAN	* <i>aki</i>	grandfather
PAN	* <i>akú</i>	I; “EGO”
PMP	* <i>alap</i>	take, collect
PMP	* <i>a+liR</i>	flow [cf: * <i>liR</i> , * <i>á+luR</i> ]
PHN	* <i>aliten</i>	firebrand [dbl: <i>aluten</i> ]
PHN	* <i>alub</i>	put in or over a fire
PMP	* <i>aluja</i>	paddle; row [vb; dbl: <i>paluja</i> ]
PMP	* <i>aluŋ</i>	shadow; shade
PHF	* <i>á+luR</i>	flow(ing); channel [cf. * <i>luR</i> , * <i>a+liR</i> ]
PMP	* <i>aluten</i>	firebrand [dbl: <i>aliten</i> ]
PAN	* <i>ama</i>	father, father’s brother [reference]
PHN	* <i>amá?</i>	father [address]
PMP	* <i>ama-en</i>	uncle (father’s brother)
PHN	* <i>amáH</i>	father [address]
PHN	* <i>amáŋ</i>	father [address]
PHN	* <i>amaq</i>	eat
PHN	* <i>amaRa</i>	tree sp.
PMP	* <i>amáy</i>	father [address]

PHN	* <i>am+bun</i>	dew; drizzle
PHF	* <i>?amin</i>	all (gone); to use up (all)
PHN?	* <i>am+pet</i>	check, staunch, stop the flow
PAN	* <i>anaduq</i>	long (of objects) [cf: * <i>adaduq</i> ]
PMP	* <i>ánay</i>	termite
PMP	* <i>anduj</i>	ancestors
PMP	* <i>anipa</i>	large snake sp.
